Comments received on Webex outside of the comment periods outlined above will not be included in the record.

Date Posted: November 2, 2023

Americans With Disabilities Act - The City of Tracy complies with the Americans with Disabilities Act and makes all reasonable accommodations for the disabled to participate in Council meetings. Persons requiring assistance or auxiliary aids should call City Hall (209/831-6105) 24 hours prior to the meeting.

Addressing the Council on Items on the Agenda - The Brown Act provides that every regular Council meeting shall provide an opportunity for the public to address the Council on any item within its jurisdiction before or during the Council's consideration of the item, provided no action shall be taken on any item not on the agenda. To facilitate the orderly process of public comment and to assist the Council to conduct its business as efficiently as possible, members of the public wishing to address the Council are requested to, but not required to, hand a speaker card, which includes the speaker's name or other identifying designation and address to the City Clerk prior to the agenda item being called. Generally, once the City Council begins its consideration of an item, no more speaker cards will be accepted. An individual's failure to present a speaker card or state their name shall not preclude the individual from addressing the Council. Each citizen will be allowed a maximum of five minutes for input or testimony. In the event there are 15 or more individuals wishing to speak regarding any agenda item including the "Items from the Audience/Public Comment" portion of the agenda and regular items, the maximum amount of time allowed per speaker will be three minutes. When speaking under a specific agenda item, each speaker should avoid repetition of the remarks of the prior speakers. To promote time efficiency and an orderly meeting, the Presiding Officer may request that a spokesperson be designated to represent similar views. A designated spokesperson shall have 10 minutes to speak. At the Presiding Officer's discretion, additional time may be granted. The City Clerk shall be the timekeeper.

Consent Calendar - All items listed on the Consent Calendar are considered routine and/or consistent with previous City Council direction. One motion, a second, and a roll call vote may enact the items listed on the Consent Calendar. No separate discussion of Consent Calendar items shall take place unless a member of the City Council, City staff or the public request discussion on a specific item.

Addressing the Council on Items not on the Agenda – The Brown Act prohibits discussion or action on items not on the posted agenda. The City Council's Meeting Protocols and Rules of Procedure provide that in the interest of allowing Council to have adequate time to address the agendized items of business, "Items from the Audience/Public Comment" following the Consent Calendar will be limited to 15-minutes maximum period. "Items from the Audience/Public Comment" listed near the end of the agenda will not have a maximum time limit. A five-minute maximum time limit per speaker will apply to all individuals speaking during "Items from the Audience/Public Comment". For non-agendized items, Council Members may briefly respond to statements made or questions posed by individuals during public comment; ask questions for clarification; direct the individual to the appropriate staff member; or request that the matter be placed on a future agenda or that staff provide additional information to Council. When members of the public address the Council, they should be as specific as possible about their concerns. If several members of the public comment on the same issue an effort should be made to avoid repetition of views already expressed.

Notice - A 90 day limit is set by law for filing challenges in the Superior Court to certain City administrative decisions and orders when those decisions or orders require: (1) a hearing by law, (2) the receipt of evidence, and (3) the exercise of discretion. The 90 day limit begins on the date the decision is final (Code of Civil Procedure Section 1094.6). Further, if you challenge a City Council action in court, you may be limited, by California law, including but not limited to Government Code Section 65009, to raising only those issues you or someone else raised during the public hearing, or raised in written correspondence delivered to the City Council prior to or at the public hearing.

Full copies of the agenda are available on the City's website: *www.cityoftracy.org*

Date Posted: November 2, 2023

CALL TO ORDER

ACTIONS, BY MOTION, OF CITY COUNCIL PURSUANT TO AB 2449, IF ANY

ROLL CALL

PLEDGE OF ALLEGIANCE

INVOCATION

PRESENTATIONS

ORDER OF BUSINESS

1. CONSENT CALENDAR

1.A. Approval of October 17, 2023 Closed Session and Regular Meeting Minutes and October 24, 2023 Special Meeting Minutes.

1.B. Staff recommends that the City Council adopt a Resolution authorizing the: (1) acceptance of the Edward Byrne Memorial Justice Assistance Grant of $14,839, (2) appropriation of the full grant funds to the Police Department operational budget for Fiscal Year 2023/24, and (3) execution by the Mayor of the grant acceptance and requisite certifications and assurances.

1.C. Staff recommends that the City Council adopt the resolution approving a Professional Services Agreement with CHS Consulting, Inc. in a not-to-exceed amount of $140,243 to complete a Short Range Transit Plan for the Tracer Public Transit System.

1.D The Tracy Homelessness Advisory Committee recommend that City Council adopt a Resolution: 1) Authorizing the acceptance of a grant award from Health Plan of San Joaquin in the amount of $595,000 to partially fund the continued operation of the Tracy Interim Shelter Site; and 2) Appropriating the total grant funds to the Mobility and Housing Department, Homeless Services Division budget.

1.E. The Tracy Homelessness Advisory Committee recommend that the City Council adopt a Resolution (1) approving Amendment No. 1 to the General Services Agreement (Agreement) with United Fence Services, Inc., to extend the term of the Agreement through December 31, 2024 for the rental of fence panels, stands and safety brackets required at the Temporary Emergency Housing Facility (TEHF).

1.F. The Tracy Finance Committee recommends that the City Council adopt a resolution amending the City's Operating and Capital Budget for the Fiscal Year ending June 30, 2024, and authorize the Budget Officer to amend the City's position control roster for FY2023-24.

1.G Staff recommends that the City Council, by motion, appoint two students to serve on the Environmental Sustainability Commission.

1.H. Staff recommends that the City Council adopt a Resolution (1) awarding a construction contract to Dirt Dynasty, Inc., of Farmington, California, in the amount of $2,765,226 for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Valpico Road Intersection Project, CIP 72095, (2) approving contingency amount of $276,523 and an overall project not-to-exceed budget of $3,629,321, and (3) the Tracy Finance Committee recommends that the City Council authorize the appropriation of $2,615,202 from Master Plan Traffic Impact Fees, and $404,482 from Ellis Traffic Fees, to CIP 72095.

1.I. Staff recommends that the City Council adopt a resolution: (1) accepting a second award distribution from the State of California Behavioral Health Services Justice Grant in partnership with the San Joaquin County Behavioral Health Services in the amount of $93,000; (2) Appropriating the grant award of $93,000 to the Police Department's operational budget.

1.J Staff recommends that the City Council adopt a resolution approving an amendment to the Lease between the City of Tracy and Giant Properties, LLC. for the Police Annex located at 1325 N. MacArthur Drive, extending the Lease for an additional 10 years with a monthly rent of $14,338.67, adjusted each year by 3%.

1.K. Staff recommends that the City Council adopt a Resolution: authorizing an increase in the Not-to-Exceed Amount for Labor Relations Negotiations and Consulting Services with Liebert Cassidy Whitmore, by $125,000, for a total Not-to-Exceed Amount of $225,000.

2. ITEMS FROM THE AUDIENCE

3. REGULAR AGENDA

3.A. Staff recommends that the City Council conduct a public hearing and, upon conclusion, adopt a Resolution: 1) adopting the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program, in accordance with the California Environmental Quality Act, for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection Project, Capital Improvement Project 72104, and 2) authorizing the City Manager to execute and file the Notice of Determination.

3.B. The Planning Commission recommends that the City Council conduct a public hearing and, upon conclusion, introduce an Ordinance: 1) Certifying, in accordance with the California Environmental Quality Act (CEQA), an Environmental Impact Report (EIR), adopting a Mitigation Monitoring and Reporting Program (MMRP), and making findings of fact and a statement of overriding considerations, for the annexation and future development of industrial buildings on the 191.18 acre property located at the northeast corner of Grant Line and Paradise Roads (Assessor's Parcel Numbers 213-170-14, -24, -25, -26, -27, And -48), collectively the Property; 2) Amending the Northeast Industrial ("NEI") Specific Plan to add the Property to the NEI Specific Plan Area with a land use designation of Light Industrial (SPA22-0003); 3) Approving the prezoning of the Property to NEI Specific Plan Zone (AP20-0003); and 4) Approving the submittal of a petition to the San Joaquin County Local Agency Formation Commission for annexation of the Property to the City of Tracy..

3.C. Discuss whether to convert, voluntarily, from an at-large election method to a district-based election method, and upon the conclusion of such discussion, by motion, either (1) direct staff to return to the City Council with implementing actions for such a conversion or (2) determine to take no further actions at this time.

3.D. Approve by motion, after discussion, out-of-state travel for designated City Council Members to Atlanta, Georgia for the National League of Cities: City Summit 2023.

3.E. Staff recommends that the City Council adopt a Resolution: 1) rescinding Resolution 2023-217 that approved amendments to the Regular Meeting Calendar of the Tracy City Council for 2023 (Calendar); and 2) approving an amended Regular Meeting Calendar of the Tracy City Council for 2023.

October 17, 2023, 5:00 p.m.

Tracy City Hall, 333 Civic Center Plaza, Tracy, CA.

1. Mayor Young called the meeting to order at 5:01 p.m.

2. There were no action taken pursuant to AB 2449.

3. Roll Call found Council Member Evans, Mayor Pro Tem Davis and Mayor Young present. Council Members Arriola and Bedolla absent from roll call.

   Council Member Arriola arrived at 5:06 p.m.

4. Items from the audience – None

5. Request to Conduct Closed Session

   5.A Personnel Matter (Gov. Code § 54957(b)(1))

   Public Employee Evaluation of Performance

   Position Title: City Attorney

   5.B Personnel Matter (Gov. Code § 54957(b)(1))

   Public Employee Evaluation of Performance

   Position Title: City Manager

   Sandy Taylor stated on August 7 she raised concerns regarding the City Attorney and shared her concerns regarding the records she received after submitting a public records request to the State Bar regarding the City Attorney not complying with the state bar renewal of MCLE license. It is Council's job to make sure we have competent and quality representation.

ACTION: Motion was made by Mayor Pro Tem Davis and seconded by Council Member Evans to recess to closed session. Roll call found Council Members Arriola, Evans, Mayor Pro Tem Davis and Mayor Young in favor; passed and so ordered. Council Member Bedolla absent.

   Council Member Bedolla arrived at 5:10 p.m.

6. Mayor Young reconvened the meeting to open session at 7:03 p.m.

7. Report of Final Action, if Any - None

8. Council Items and Comments - None

9. Adjournment – Time: 7:04 p.m.

ACTION: Motion was made by Council Member Arriola and seconded by Mayor Pro Tem Davis to adjourn. Roll call found all in favor; passed and so ordered.

The above agenda was posted at the Tracy City Hall on October 13, 2023. The above are action minutes. A recording is available at the office of the City Clerk.

TRACY CITY COUNCIL REGULAR MEETING MINUTES

October 17, 2023, 7:00 p.m.

City Hall, 333 Civic Center Plaza, Tracy *Web Site: www.cityoftracy.org*

Mayor Young called the meeting to order at 7:09 p.m.

Roll call found Council Members Arriola, Bedolla, Evans, Mayor Pro Tem Davis and Mayor Young present.

Mayor Young led the Pledge of Allegiance.

Pastor Doug Diestler, Tracy Mission Church offered the invocation.

There were no actions taken pursuant to AB 2449.

Mayor Young presented a Proclamation for Arbor Day to John Newman, Forestry Superintendent.

Mayor Young presented a Proclamation for Breast Cancer Awareness Month to Gina Peace, survivor.

Midori Lichtwardt, Interim City Manager presented the Employee of the Month Award for October to Necy Lopez, Deputy City Clerk.

1. CONSENT CALENDAR – Motion was made by Council Member Bedolla and seconded by Mayor Pro Tem Davis to adopt the Consent Calendar. Roll call found all in favor; passed and so ordered.

   1.A. Adoption of October 3, 2023 Closed Session and Regular Meeting Minutes. – **Minutes were adopted.**

   1.B. City Council 1) declare certain vehicles, equipment and commodities as surplus pursuant to Tracy Municipal Code Section 2.20.310, and 2) approve the sale of such surplus property at public auction to the highest bidder. - **Resolution 2023-210** declared certain vehicles, equipment and commodities as surplus and the sale of such surplus property.

   1.C. Adopt a Resolution approving Amendment No. 1 to the Professional Services Agreement with Guidepost Solutions, LLC for the Security System Implementation for the City's Water Facilities Project, CIP 75169, to extend the term of the Agreement, amend the scope of work, and increase the total compensation by $18,400 (for a total not-to-exceed amount of $71,690).– **Resolution 2023-211** approved the amendment to the agreement with Guidepost Solutions, LLC.

1.D. Adopt a Resolution: (1) authorizing the submittal of an application, and upon award, execution by the Mayor of a grant agreement with the California Department of Transportation Division of Aeronautics, for the Airport Improvement Program Matching Grant 3-06-0259-025-2023; and (2) subject to and upon award, accepting such grant funds and appropriating the full grant amount to Capital Improvement Project 77593 - Slurry Seal Tee Hangar Taxilanes Project. – **Resolution 2023-212** authorized the submittal of an application and upon award, execution of a Grant Agreement with California Department of Transportation Division of Aeronautics.

1.E. The Tracy Homelessness Advisory Committee recommends that the City Council adopt a resolution (1) making a determination that United Site Services of California, Inc. provides unique products and services that are not available from other sources, therefore compliance with the standard procurement process is not in the best interest of the City pursuant to Tracy Municipal Code Section 2.20.180(B)(2) and (2) approving the general services agreement with United Site Services of California, Inc., with a not-to-exceed amount of $125,000, to provide temporary showers and restrooms to Phase IV-Custom Container occupants until permanent bathrooms are installed under Phase II-Site Improvements at the Temporary Emergency Housing Facility, CIP 71112, at 370 West Arbor Avenue.- **Resolution 2023-213** approved the General Services Agreement with United Site Services.

1.F. Adopt the Resolution authorizing the award of a construction contract to Anderson Striping and Construction, Inc. in the not-to-exceed amount of $269,354, and (2) authorizing a contingency for change orders in the amount of $26,935.– **Resolution 2023-214** awarded the construction contract to Anderson Striping and Construction, Inc.

2. ITEMS FROM THE AUDIENCE – Robert Tanner spoke about travel expenses and asked what grants the Mayor is bringing in for the City with those expensive memberships, not including One Voice trip to Washington D.C. or the San Joaquin County Supervisor grants for the homeless, and suggested the Mayor identify those grants at the end of the fiscal year or a memorandum. The Police Department annually has a one-page list of all the grants that they were able to bring in for the Police Department.

Wes Huffman stated he previously asked and sent emails to the Council to consider the political sign rules for the City for our elections. Did not get a response and it is not agendized. Mr. Huffman made the request again and will follow up with an email.

Melissa shared concerns regarding the City allowing people to have many cars that block public parking on the streets and provided an example of a neighbor having eight cars for a household of four, has vehicles on the street and driveway that do not move and suggested Council look into this issue.

Mike Souza, Tracy Hills Project stated they met with staff and had a productive meeting and thanked everyone for hearing them out.

Rosario Arulappan spoke about needing more time to talk at public meetings, placing public hearings as first item on the agenda, having to wait for three hours to speak on

items and on September 5, Mayor Pro Tem Davis took over the meeting and allowed all Ellis residents to speak about the developer regarding the school. Mr. Arulappan shared the City Attorney is doing an amazing job getting the land for Aquatic Center at Ellis and the Attorney is being targeted and he is being targeted personally with misinformation, misguidance with social media. Mr. Arulappan also spoke about the need for a Lammers Road exit – I-580.

Don Penning acknowledged Necy Lopez and Gina Peace for being recognized at the meeting, Fire Department for their response to a student who suffered from a heart attack at school, Police Department for their response to a car that went into the canal and citizens that helped the situation. Mr. Penning spoke about the City Attorney's lapse with the Bar Association, did research and she was not the only one that had that lapse. There were some clerical errors back then and a lot more to it than just hers.

3. REGULAR AGENDA

3.A Adopt a Resolution adopting the 2024 Development Fee for the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan.

Bill Dean, Assistant Director of Development Services provided the staff report.

Council questions followed.

There was no public comment.

ACTION: Motion was made by Council Member Arriola and seconded by Mayor Pro Tem Davis to adopt **Resolution 2023-215** adopting the 2024 Development Fee for the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan**.** Roll call found all in favor; passed and so ordered.

3.B Adopt a Resolution 1) authorizing the issuance and sale of special tax bonds for the purpose of financing authorized facilities and 2) approving and authorizing related documents and actions for Improvement Area No. 2 of the City of Tracy Community Facilities District No. 2016-1.

Sara Cowell, Finance Director provided the staff report.

Mike Souza, Tracy Hills Project thanked staff and consultants for making it happen. It is an important part of financing infrastructure for projects like Tracy Hills.

There were no Council comments.

ACTION: Motion was made by Mayor Pro Tem Davis and seconded by Council Member Evans to adopt **Resolution 2023-216** authorizing the issuance and sale of special tax bonds for the purpose of financing authorized facilities and approving and authorizing related documents and actions for City of Tracy Community Facilities District No. 2016-1 (Tracy Hills) with respect to Improvement Area No. 2 of the City of Tracy Community Facilities District No. 2016.1 (Tracy Hills). Roll call found all in favor; passed and so ordered.

3.C Adopt a Resolution: 1) rescinding Resolution 2022-184 that approved the Regular Meeting Calendar of the Tracy City Council for 2023 (Calendar); and 2) approving an amended Regular Meeting Calendar of the Tracy City Council for 2023.

Adrianne Richardson, City Clerk provided the staff report.

There was no public comment.

Council questions and comments followed.

It was Council's consensus to cancel the November 21, 2023, Council meeting and direct staff to poll Council for a special meeting in December 2023 or January 2024, if needed.

ACTION: Motion was made by Mayor Pro Tem Davis and seconded by Council Member Arriola to adopt **Resolution 2023-217** 1) Rescinding Resolution 2022-184 that approved the regular meeting calendar of the Tracy City Council for 2023 (Calendar); and 2) approving an amended regular meeting calendar for the Tracy City Council for 2023. Roll call found all in favor; passed and so ordered.

4. ITEMS FROM THE AUDIENCE – None

5. STAFF ITEMS – Midori Lichtwardt, Interim City Manager provided the following updates:

- The Finance Committee meeting scheduled for tomorrow has been canceled and a special meeting is planned for 6:00 p.m. on Monday, October 23, 2023.
- The Draft Housing Element is now available for review on the City's homepage.
- Join us at The Grand on Sunday for an international celebration of women's voices: Lyric and Spirit. Tickets at AtTheGrand.org.
- The annual Downtown Tracy Candy Crawl is happening this Saturday from 2:00 p.m. -5:00 p.m. Join TCCA for trick-or-treating at participating downtown businesses, a costume march, and a dance party.
- The Grand is hosting Dia de los Muertos Family Day on October 28, 2023 from 10:00 a.m. to 2:00 p.m. featuring vendors, photo opportunities, hands-on activities, the community altar, and art show.
- Later that day, there will be music, food, costumes, candy, and aircraft, of course, at our Halloween at the Airport event from 2:00 p.m. – 5:00 p.m.

Bijal Patel, City Attorney introduced Jeff Crosswhite, Assistant City Attorney.

6. COUNCIL ITEMS – Council Member Arriola wished everyone a happy Halloween and Dia de los Muertos for those who celebrate.

Council Member Evans announced on Veterans Day, November 11, 2023, at 11:00 a.m. at the War Memorial outside City Hall the POW-MIA flag will be flying for the first time and will be permanent in the future. Council Member Evans attended the Boys and Girls Club fundraiser Gala last Saturday hosted by Jeff and Janet Brown. Lot of funds raised from responsible and generous members of the community at the event. Council Member Evans shared the Boys and Girls Club's mission.

Mayor Pro Tem Davis stated she also attended the Boys and Girls Club Gala and it was remarkable how much money was raised for the youth of our community, and was a wonderful statement made by the community. Mayor Pro Tem Davis also attended Blues Brews & BBQ and a number of events.

Council Member Bedolla announced on Saturday October 21, 2023 the Southside Community Organization is hosting a Day of the Dead or Dia de los Muertos free workshop from 11:00 a.m. to 2:00 p.m. at the Guadalupe Center, 126 West 1st Street with the combination on November 4, 2023 at 11:00 a.m. There will be Dia de los Muertos or Day of the Dead celebration at the Southside Community Organization at 126 West 1st Street.

Mayor Young announced on October 4, 2023, Council attended the 2023 Quick Draw Art Contest reception at the Grand Theatre and congratulated the artists. One art piece was included in the silent auction at the Boys and Girls Club Gala. Please be careful at Halloween and have fun. Mayor Young also announced there is a special concurrent meeting on October 24, 2023, with the Planning Commission at 5:00 p.m.

7. ADJOURNMENT – Time: 8:20 p.m.

ACTION: Motion was made by Council Member Arriola and seconded by Mayor Pro Tem Davis to adjourn. Roll call found all in favor; passed and so ordered.

The above agenda was posted at the Tracy City Hall on October 12, 2023. The above are action minutes. A recording is available at the office of the City Clerk.

SPECIAL CONCURRENT MEETING MINUTES OF THE TRACY CITY COUNCIL AND THE TRACY PLANNING COMMISSION

October 24, 2023, 5:00 p.m.

Tracy City Hall, 333 Civic Center Plaza, Tracy, CA.

1. Mayor Young called the meeting to order at 5:03 p.m.

2. There were no actions taken pursuant to AB 2449.

3. Roll call found Council Members Bedolla, Evans, Mayor Pro Tem Davis and Mayor Young present. Council Member Arriola was absent from roll call.

   Roll call found Planning Commissioners Boakye-Boateng, English, Penning, Vice Chair Atwal present. Chair Orcutt was absent.

   Council Member Arriola arrived at 5:11 p.m. during Items of the Audience.

4. ITEMS FROM THE AUDIENCE – Robert Tanner expressed concerns regarding the number of cannabis shops that are proposed in the City, asked that City Council make changes and follow the rules that were originally implemented by the Planning Commission.

5. DISCUSSION ITEMS:

   5.A Staff recommends that the City Council and the Planning Commission conduct a concurrent meeting to receive public input on the Draft Housing Element and direct staff to make amendments, as instructed, and submit the Draft Housing Element to the State Department of Housing and Community Development for review.

   Alan Bell, Senior Planner, and Veronica Tam from Veronica Tam and Associates and Dan Wery from Michael Baker International, Inc provided the staff report.

   Council and Planning Commission comments followed.

   Justin Derby, Meritage Homes referred to the 100 acres adjacent to Home Depot and expressed his excitement to work with the City in this project and shared there are many elements to this project, the importance of rezoning the areas to meet the criteria of the housing element that includes medium to higher density housing and Meritage Homes is far enough in the project that it has real viability and would like to build in the City.

   John Beckman from Building Industry Association of the Greater Valley shared information from a press release from the Governor's office and the shortage of housing in California, and expressed the problem is the policies that are in place are not being implemented and are being disregarded and the City is causing a governmental constraint within City Hall that needs to be rectified and until then, the BIA will be recommending to HCD that the plan that is presented be rejected.

A community member asked why this plan was not brought back sooner, why rezoning has not been done yet and how is there a plan to build without this process being done.

Council and Planning Commission questions and comments continued.

Action: Motion was made by Mayor Pro Tem Davis and seconded by Council Member Arriola to receive the public input on the Draft Housing Element and direct staff to make amendments, as instructed, and submit the Draft Housing Element to the State Department of Housing and Community Development for review. Roll call found Council Members Arriola, Bedolla, Evans, Mayor Pro Tem Davis, Mayor Young, Planning Commissioners Boakye-Boateng, English, Penning and Vice Chair Atwal, all in favor; passed and so ordered. Planning Commissioner Chair Orcutt absent.

6. COUNCIL ITEMS AND COMMENTS – Mayor Young stated that November 15-18th is the National League of Cities, in Atlanta and requested clear out of state travel procedures, clarification on the policy, asked for a travel request and potential amendment to the travel policy.

Midori Lichtwardt, Interim City Manager clarified that Mayor Young was asking for the travel policy to come back for discussion to approve out of state travel for one of its members and that item would come back on November 7th.

Mayor Young stated that she would like clarity since Council has approved individual budgets.

Bijal Patel, City Attorney clarified that there are two potential requests, one is a request for travel and the second is to potentially amend the travel policy and shared that the second request can come back.

Council Member Arriola seconded both actions clarifying that as long as the expenditure is within the budget it will not have to come back to budget.

Mayor Pro Tem Davis asked for support to reinstate the December 19th regular Council meeting, considering that there are critical items where the Council should consider having that meeting after all. Council Member Evans supported the request.

Council Member Evans stated that he was approached by some of the Transportation Commissioners about reprioritizing a section of roadway, specifically South Tracy Blvd to Valpico to the entryway to the Tracy Municipal Airport and requested that this stretch of road be prioritized for repairs considering that there are more activities planned at the Airport. Mayor Pro Tem Davis seconded the request. Mayor Young clarified that the request was to bring back the Pavement Management Plan. Council Member Evans asked if staff could prioritize this and bring back said plan and options for the Council body to consider.

Ms. Lichtwardt asked for clarification if Council Member Evans was referring to Linne to Valpico. Council Member Evans confirmed.

Mayor Young expressed the importance of considering the importance of following processes when considering items to come back to Council.

7. ADJOURNMENT – Time: 9:05 p.m.

ACTION: Motion was made by Council Member Arriola and seconded by Mayor Pro Tem Davis to adjourn. Roll call found Council Members Arriola, Bedolla, Evans, Mayor Pro Tem Davis, Mayor Young, Planning Commissioners Boakye-Boateng, English, Penning and Vice Chair Atwal, all in favor; passed and so ordered. Planning Commissioner Chair Orcutt absent.

The above agenda was posted at the Tracy City Hall on October 19, 2023. The above are action minutes. A recording is available at the office of the City Clerk.

November 7, 2023

Agenda Item 1.B

RECOMMENDATION

Staff recommends that the City Council adopt a Resolution authorizing the: (1) acceptance of the Edward Byrne Memorial Justice Assistance Grant of $14,839, (2) appropriation of the full grant funds to the Police Department operational budget for Fiscal Year 2023/24, and (3) execution by the Mayor of the grant acceptance and requisite certifications and assurances.

EXECUTIVE SUMMARY

The City of Tracy has been awarded $14,839 from the federal Edward Byrne Justice Assistance Grant (JAG) Program for funding technology and equipment for law enforcement officers. This report recommends that the City of Tracy accept the grant and appropriate the full grant funds of $14,839 to the Tracy Police Department budget for Fiscal Year 2023/24.

BACKGROUND AND LEGISLATIVE HISTORY

The JAG Program (42 U.S.C. 3751(a)) is the primary provider of federal criminal justice funding to state and local jurisdictions. JAG funds support all components of the criminal justice system by improving the effectiveness and efficiency of criminal justice systems, processes, and procedures.

Agencies are allowed to use this grant to support law enforcement related to procuring equipment, technology, and other material directly related to basic law enforcement functions.

The JAG grant is a formula-based grant. For each state and territory, the Bureau of Justice Statistics calculates a minimum base allocation which, based on the congressionally mandated JAG formula, can be enhanced by (1) the state's share of the national population and (2) the state's share of the country's Part 1 violent crime statistics as reported by the Federal Bureau of Investigation's Uniform Crime Reporting Program. Once the state funding is calculated, 60 percent of the allocation is awarded to the state and 40 percent to eligible units of local government.

ANALYSIS

The funds requested through the Edward Byrne Memorial Justice Assistance will be utilized to purchase a Microsoft Surface Hub 2S.

Tracy Police Department's Emergency Operations Center was designed over 30 years ago and still operates under much of its original configuration. Due to this, the department has found that the center lacks technology, ergonomics, and effective place to work collaboratively during a critical incident.

The proposed purchase of this surface hub will assist the Police Department with its goals to promote officer safety and community safety, improve efficiency, and advance department technology.

This new technology will work seamlessly with planned development of the Department's Real Time Information Center, which will be built adjacent to the Emergency Operations Center. It will allow for collaboration between staff working in the Real Time Information Center, Incident Command staff, and others who work remotely to efficiently work an incident together.

The addition of Microsoft Surface Hub 2S is one step towards a full technology upgrade and will assist staff to work more efficiently and collaboratively.

Accepting the award requires the Mayor to execute the award acceptance and sign the U.S. Department of Justice Certifications and Assurances (Attachment A).

FISCAL IMPACT

Acceptance of the JAG grant and appropriation of the $14,839 in funding will be used for the purchase of Microsoft Surface Hub 2S. The estimated cost of the Surface Hub 2S, along with its accessories and 3 years maintenance is $32,327. The purchase will be funded through the combination of the JAG award of $14,839 and through the Police Department's FY2023-24 adopted operational budget. Staff is recommending that, in addition to accepting this grant funding, the City Council appropriate the full grant funds to the Police Department's operating budget.

PUBLIC OUTREACH/ INTEREST

The community supports the Police Department's initiatives and goals to promote officer safety and community safety, improve efficiency, and advance department technology.

COORDINATION

There are no coordinated efforts for this equipment purchase.

CEQA DETERMINATION

CEQA is not applicable for this grant funding or proposed project.

STRATEGIC PLAN

This agenda item relates to Council's Strategic Priorities for Public Safety.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council adopt a Resolution authorizing the: (1) acceptance of the Edward Byrne Memorial Justice Assistance Grant of $14,839, (2) appropriation of the full grant funds to the Police Department operational budget for Fiscal Year 2023/24, and (3) execution by the Mayor of the grant acceptance and requisite certifications and assurances.

U.S. DEPARTMENT OF JUSTICE
OFFICE OF JUSTICE PROGRAMS

Edward Byrne Memorial Justice Assistance Grant Program FY 2023 Local Solicitation

Certifications and Assurances by the Chief Executive of the Applicant Government

On behalf of the applicant unit of local government named below, in support of that locality's application for an award under the FY 2023 Edward Byrne Memorial Justice Assistance Grant ("JAG") Program, and further to 34 U.S.C. § 10153(a), I certify to the Office of Justice Programs ("OJP"), U.S. Department of Justice ("USDOJ"), that all of the following are true and correct:

1. I am the chief executive of the applicant unit of local government named below, and I have the authority to make the following representations on my own behalf as chief executive and on behalf of the applicant unit of local government. I understand that these representations will be relied upon as material in any OJP decision to make an award, under the application described above, to the applicant unit of local government.

2. I certify that no federal funds made available by the award (if any) that OJP makes based on the application described above will be used to supplant local funds, but will be used to increase the amounts of such funds that would, in the absence of federal funds, be made available for law enforcement activities.

3. I assure that the application described above (and any amendment to that application) was submitted for review to the governing body of the unit of local government (*e.g.*, city council or county commission), or to an organization designated by that governing body, not less than 30 days before the date of this certification.

4. I assure that, before the date of this certification— (a) the application described above (and any amendment to that application) was made public; and (b) an opportunity to comment on that application (or amendment) was provided to citizens and to neighborhood or community-based organizations, to the extent applicable law or established procedure made such an opportunity available.

5. I assure that, for each fiscal year of the award (if any) that OJP makes based on the application described above, the applicant unit of local government will maintain and report such data, records, and information (programmatic and financial), as OJP may reasonably require.

6. I have carefully reviewed 34 U.S.C. § 10153(a)(5), and, with respect to the programs to be funded by the award (if any), I hereby make the certification required by section 10153(a)(5), as to each of the items specified therein.

RESOLUTION NO. _____

AUTHORIZING THE: (1) ACCEPTANCE OF THE EDWARD BYRNE MEMORIAL JUSTICE ASSISTANCE GRANT OF $14,839, (2) APPROPRIATION OF THE FULL GRANT FUNDS TO THE POLICE DEPARTMENT OPERATIONAL BUDGET FOR FISCAL YEAR 2023/24, AND (3) EXECUTION BY THE MAYOR OF THE GRANT ACCEPTANCE AND REQUISITE CERTIFICATIONS AND ASSURANCES.

WHEREAS, The United States Department of Justice, Office of Justice Programs, Bureau of Justice Assistance coordinates the annual Edward Byrne Justice Assistance Grant (JAG) Program that makes available federal public safety funds to local jurisdictions; and

WHEREAS, The City of Tracy has received an award of $14,839 for calendar year 2023 under a pre-designated grant formula; and

WHEREAS, The Tracy Police Department's Emergency Operations Center (EOC) was designed over 30 years ago and still operates under much of its original configuration; and

WHEREAS, Due to the EOC's age, the Police Department has found that the center lacks technology, ergonomics, and effective place to work collaboratively during a critical incident; and

WHEREAS, The Tracy Police Department intends to use the grant funds towards the purchase cost of a Microsoft Surface Hub 2S; and

WHEREAS, The purchase will assist the Police Department with its goals to promote officer safety and community safety, improve efficiency, and advance department technology; and

WHEREAS, The purchase will be funded through the combination of the JAG award of $14,839 and through the already approved Police Department's operational budget for Fiscal Year 2023/24;

NOW, THEREFORE, be it resolved as follows:

RESOLVED: That the above recitals are true and correct; and be it,

RESOLVED: That the City Council of the City of Tracy hereby accepts the grant award of $14,839 from the Edward Byrne Memorial Justice Assistance Grant (JAG) for funding equipment, technology, and other material directly related to basic law enforcement functions; and be it further

RESOLVED: That the City Council appropriates the full grant funds of $14,839 to the already approved Police Department's operational budget for Fiscal Year 2023/24, and be it further

RESOLVED: That the City Council authorizes the Mayor to execute the award acceptance and U.S. Department of Justice certificate and assurances, after review and approval by the City Attorney's Office of such documents; and be it further

RESOLVED: That the City Council authorizes the City Manager, in consultation with the City Attorney, to take any and all actions that may be necessary or advisable to effectuate the purposes of this Resolution.

Agenda Item 1.C

RECOMMENDATION

Staff recommends that the City Council adopt the resolution approving a Professional Services Agreement with CHS Consulting, Inc. in a not-to-exceed amount of $140,243 to complete a Short Range Transit Plan for the Tracer Public Transit System.

EXECUTIVE SUMMARY

The City of Tracy must periodically update its Short Range Transit Plan (SRTP) in order to fulfill planning requirements on the federal, state, and regional level for its provided public transit service.

On August 4, 2023, the City of Tracy issued a Request for Proposals (RFP) to obtain the services of a contractor to provide professional services in the development of a City of Tracy SRTP. One proposal was submitted by the established deadline of September 1, 2023. Staff evaluated the proposal using explicit criteria, including related experience, understanding of the RFP requirements, proposed timeline, and proposed methodology. After review of the proposal, staff determined that CHS Consulting Inc. (CHS), a California Corporation, was responsive to the City's needs.

Staff is now requesting that City Council approve a Professional Services Agreement, in the amount of $140,243 between the City and CHS.

BACKGROUND AND LEGISLATIVE HISTORY

In May 2023, the San Joaquin Council of Governments (SJCOG) adopted SRTP Guidelines for all transit agencies within San Joaquin County. These guidelines require that all transit operators completely update their SRTPs every five years. These SRTPs are required to be submitted to SJCOG and are used in the development of the Regional Transit Systems Plan (RTSP), which also has an update cycle of five years. The RTSP aids in the development of transit system performance objectives for each local transit operator. SRTPs are due to SJCOG as early as 2024, but no later than 2025.

The City's previous SRTP was adopted in August 2019. It will take approximately 12 months to complete the updated SRTP. The planning horizon for the SRTP is 10 years and includes operation and capital planning over that time period.

ANALYSIS

The City's previous SRTP was adopted in August 2019. Approximately seven months after its adoption, the COVID-19 pandemic changed the way society operated and specifically resulted in significant changes to the use of public transit. Many of the concepts that were outlined in the adopted SRTP were no longer valid, as all the assumptions they were based on had changed significantly.

While some of the recommended changes have been implemented, such as the use of the

Tracer Plus on-demand service, an update to the plan is needed as public transit environment, as well as the development of the City of Tracy, has changed significantly over the past few years.

Updating the SRTP will allow the City to gather fresh data on the ridership trends and patterns within Tracy and allow for the development of a system that reflects the current and future development plans.

It is anticipated that this effort will take approximately 12 months to complete and be finished by the end of 2024.

FISCAL IMPACT

This project was approved by the City Council as CIP 77591 in the adopted FY23/24 Budget. The costs are covered completely by Transportation Development Act funding.

STRATEGIC PLAN

This item supports the overall purpose of the Quality of Life Strategic Priority to provide an outstanding quality of life by enhancing the City's amenities, business mix and services and cultivating connections to promote positive change and progress in our community.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council adopt the resolution approving a Professional Services Agreement with CHS Consulting, Inc in a not-to-exceed amount of $140,243 to complete a Short Range Transit Plan for the Tracer Public Transit System.

Attachment A – Professional Services Agreement with CHS Consulting, Inc.

Attachment A

CITY OF TRACY
PROFESSIONAL SERVICES AGREEMENT WITH
CHS CONSULTING, INC.

This Professional Services Agreement (**Agreement**) is entered into between the City of Tracy, a municipal corporation (**City**), and CHS Consulting, Inc., a California Corporation (**Consultant**). City and Consultant are referred to individually as "Party" and collectively as "Parties."

Recitals

A. City desires to retain Consultant to prepare and complete a Short Range Transit Plan for the Tracer Public Transit Service (CIP 77591) (**Project or Services**); and

B. On August 4, 2023, the City issued a Request for Proposals (RFP) for the Project. On September 1, 2023, Consultant submitted its proposal for the Project to the City. City has determined that Consultant possesses the skills, experience and certification required to provide the services.

C. After negotiations between the City and Consultant, the Parties have reached an agreement for the performance of the Services in accordance with the terms set forth in this Agreement.

D. This Agreement is being executed pursuant to Tracy Municipal Code section 2.20.140.

Now therefore, the Parties mutually agree as follows:

1. Scope of Work. Consultant shall perform the Services and complete the Project, which includes the service described in Exhibit "A" attached hereto and incorporated herein by this reference. The Services shall be performed by, or under the direct supervision of, Consultant's Authorized Representative: Linda Meckel. Consultant shall not replace its Authorized Representative, nor shall Consultant use or replace any subcontractor or subconsultant, without City's prior written consent. The City may terminate this Agreement if Consultant makes any such change or replacement, or uses any unapproved subcontractor or subconsultant.

2. Time of Performance. Time is of the essence in the performance of the Services under this Agreement and the timing requirements set forth shall be strictly adhered to unless otherwise modified in writing in accordance with this Agreement. Consultant shall begin performance promptly upon the mutual execution of this Agreement, and shall complete the Project no later than the dates set forth in Exhibit "A." Any Services for which times for performance are not specified in this Agreement shall be started and completed by Consultant in a reasonably prompt and timely manner based upon the circumstances and direction communicated to the Consultant by the City. Consultant shall submit all requests for time extensions to the City in writing no later than ten (10) days after the start of the condition which purportedly caused the delay, and not later than the date on which performance is due. City may grant or deny such requests in its sole and absolute discretion.

2.1 Term. The term of this Agreement shall begin on upon the mutual execution of this Agreement by the Parties and end upon the Completion of the Project (completion of the final Short Range Transit Plan) to the City's satisfaction, unless terminated in accordance with Section 6.

3. Compensation. City shall pay Consultant on a time and materials basis in the amount set forth in Exhibit "B," which is attached hereto and incorporated herein by this reference.

3.1 Not to Exceed Amount. Consultant's total compensation under this Agreement shall not exceed $140,243. Notwithstanding anything contained herein to the contrary, the payment of any

funds under this Agreement shall be subject to the City of Tracy's appropriation of funds for the Services. This Agreement shall terminate in the event that such funds are not appropriated. Consultant's billing rates shall cover all costs and expenses for Consultant's performance of this Agreement. Unless specifically stated otherwise or agreed to in writing, the fees proposed by Consultant, as set forth in Exhibit B hereto, shall remain unchanged for the entire term of this Agreement and any extensions of this Agreement. It is understood and agreed that Consultant may not receive compensation up to the "not-to-exceed" amount (or any other amount), and Consultant's total compensation under this Agreement will depend on the scope of the Services requested and approved by the City. No work shall be performed by Consultant in excess of the total compensation amount provided in this section without the City's prior written approval.

3.2 Invoices. Consultant shall submit monthly invoice(s) to the City that describe in detail satisfactory to the City the services performed, including times, dates, and names of persons performing the services.

3.2.1 If Consultant is providing services in response to a development application, separate invoice(s) must be issued for each application and each invoice shall contain the City's designated development application number.

3.2.2 Consultant's failure to submit invoice(s) in accordance with this Section may result in the City rejecting said invoice(s) and thereby delaying payment to Consultant.

3.3 Payment. Subject to the City acceptance of the Services as discussed in Exhibit A attached hereto and completion of the Project to the City's satisfaction, within 30 days after the City's receipt of invoice(s), City shall make payment to the Consultant based upon the services described on the invoice(s).

3.4 The acceptance by Consultant of the final payment made under this Agreement shall constitute a release of City from all claims and liabilities for compensation to Consultant for anything completed, finished or relating to Consultant's services. Consultant agrees that payment by City shall not constitute nor be deemed a release of the responsibility and liability of Consultant or its employees, subcontractors, agents and subconsultants for the accuracy and competency of the information provided and/or services performed hereunder, nor shall such payment be deemed to be an assumption of responsibility or liability by City for any defect or error in the Services performed by Consultant, its employees, subcontractors, agents and subconsultants.

3.5 Consultant agrees to maintain books, accounts, payroll records and other information relating to the performance of Consultant's obligations under the Agreement, which shall adequately and correctly reflect the expenses incurred by the Consultant in the performance of Consultant's work under the Agreement. Such books and records shall be open to inspection and audit by the City during regular business hours for three years after expiration or termination of this Agreement.

4. <u>Indemnification</u>. Consultant shall, to the fullest extent permitted by law, indemnify, defend (with independent counsel approved by the City), and hold harmless the City from and against, and reimburse the City for, any and all liabilities, obligations, losses, damages, injunctions, suits, actions, fines, penalties, claims, demands, administrative and judicial proceedings and order, judgments, remedial action requirements, costs and expenses of every kind or nature, and all costs and expenses incurred in connection therewith, including, without limitation, reasonable attorneys' fees and court costs ("**Claims**") arising directly or indirectly from or out of (including any and all related costs and expenses), relating or pertaining to or resulting from, in whole or in part, this Agreement; any act, omission, or event relating in any way to Consultant's obligations under this Agreement; and/or Consultant's breach of this Agreement, except to the extent such Claim is caused solely by the active negligence or willful misconduct of the City. In this Section 4, "City" means the City, its officials, officers, agents, employees and volunteers; "Consultant" means the Consultant, its employees, agents and subcontractors.

In the event there is a finding and/or determination that Consultant is not an independent contractor and/or is an employee of City, including but not limited to any such finding and/or determination made by the California Public Employees' Retirement System (CalPERS), the Department of Industrial Relations (DIR), or the Internal Revenue Service (IRS), Consultant shall, to the fullest extent permitted by law, indemnify, defend, and hold harmless the City from and against any all Claims relating to or in connection with such a finding and/or determination.

(The duty of a "design professional" to indemnify and defend the City is limited to claims that arise out of, pertain to, or relate to the negligence, recklessness or willful misconduct of the design professional, under Civ. Code § 2782.8.)

Consultant and City mutually waive consequential damages for claims, disputes, or other matters in question, arising out of or relating to this Agreement. This mutual waiver is applicable, without limitation, to all consequential damages due to either Party's termination of this Agreement.

The provisions of this section survive the expiration or the termination of this Agreement and are not limited by the provisions of Section 5 relating to insurance.

5. Insurance. Consultant shall, throughout the duration of this Agreement, maintain insurance to cover Consultant, its agents, representatives, and employees in connection with the performance of services under this Agreement at the minimum levels set forth herein.

5.1 Commercial General Liability (with coverage at least as broad as ISO form CG 00 01 01 96) "per occurrence" coverage shall be maintained in an amount not less than $4,000,000 general aggregate and $2,000,000 per occurrence for general liability, bodily injury, personal injury, and property damage.

5.2 Automobile Liability (with coverage at least as broad as ISO form CA 00 01 07 97, for "any auto") "claims made" coverage shall be maintained in an amount not less than $1,000,000 per accident for bodily injury and property damage.

5.3 Workers' Compensation coverage shall be maintained as required by the State of California.

5.4 Professional Liability "claims made" coverage shall be maintained to cover damages that may be the result of errors, omissions, or negligent acts of Consultant in an amount not less than $1,000,000 per claim.

5.5 Endorsements. Consultant shall obtain endorsements to the automobile and commercial general liability insurance policies with the following provisions:

5.5.1 The City (including its elected officials, officers, employees, agents, and volunteers) shall be named as an additional "insured."

5.5.2 For any claims related to this Agreement, Consultant's coverage shall be primary insurance with respect to the City. Any insurance maintained by the City shall be excess of the Consultant's insurance and shall not contribute with it.

5.6 Notice of Cancellation. Consultant shall notify the City if the policy is canceled before the expiration date. For the purpose of this notice requirement, any material change in the policy prior to the expiration shall be considered a cancellation. Consultant shall immediately obtain a replacement policy.

5.7 Authorized Insurers. All insurance companies providing coverage to Consultant shall be insurance organizations authorized by the Insurance Commissioner of the State of California to transact the business of insurance in the State of California.

5.8 Insurance Certificate. Consultant shall provide evidence of compliance with the insurance requirements listed above by providing a certificate of insurance and endorsements, in a

form satisfactory to the City, before the City signs this Agreement, and in any event, within five (5) days of such a request.

5.9 Substitute Certificates. Consultant shall provide a substitute certificate of insurance no later than 30 days prior to the policy expiration date of any insurance policy required by this Agreement.

5.10 Consultant's Obligation. Maintenance of insurance by the Consultant as specified in this Agreement shall in no way be interpreted as relieving the Consultant of any responsibility whatsoever (including indemnity obligations under this Agreement), and the Consultant may carry, at its own expense, such additional insurance as it deems necessary. Failure to provide or maintain any insurance policies or endorsements required herein may result in the City terminating this Agreement.

6. Termination. The City may terminate this Agreement in its sole and absolute discretion by giving ten (10) days' written notice to Consultant. Within five (5) days of such a termination, Consultant shall give the City all original documents relating to the Services in Consultant's possession or control, including, without limitation, preliminary drafts and supporting documents, and any other documents prepared by Consultant pursuant to this Agreement. The City shall pay Consultant for all services satisfactorily performed in accordance with this Agreement, up to the date notice is given.

7. Dispute Resolution. If any dispute arises between the City and Consultant that cannot be settled after engaging in good faith negotiations, City and Consultant agree to resolve the dispute in accordance with the following:

7.1 Each Party shall designate a senior management or executive level representative to negotiate the dispute;

7.2 The representatives shall attempt, through good faith negotiations, to resolve the dispute by any means within their authority.

7.3 If the issue remains unresolved after fifteen (15) days of good faith negotiations, the Parties shall attempt to resolve the disagreement by negotiations between legal counsel. If the aforementioned process fails, the Parties shall resolve any remaining disputes through mediation to expedite the resolution of the dispute.

7.4 The mediation process shall provide for the selection within fifteen (15) days by both Parties of a disinterested mediator with at least ten (10) years experience in the field of law subject to the dispute, shall be commenced within thirty (30) days of selection of a mediator, and shall be concluded within fifteen (15) days from the commencement of the mediation.

7.5 The Parties shall equally bear the costs of any third party in any alternative dispute resolution process.

7.6 The dispute resolution process is a material condition to this Agreement and must be exhausted prior to either Party initiating legal action. If, for any dispute or claim to which this Section applies, any Party commences an action without first attempting to resolve the matter through the process set forth in this Section, or refuses to comply with this Section after a request has been made, then that Party shall not be entitled to recover attorney fees, even if they would otherwise be available to that party in any such action. This dispute resolution process is not intended to nor shall be construed to change the time periods for filing a claim or action specified by Government Code §§ 900 et seq.

8. Ownership of Work. All original documents prepared by Consultant for this Agreement, whether complete or in progress, are the property of the City, and shall be given to the City at the completion of Consultant's Services, upon termination of this Agreement, or upon demand from the City. No such documents shall be revealed or made available by Consultant to any third party without the City's prior written consent.

9. Independent Contractor Status. Consultant is an independent contractor and is solely responsible for the acts of its employees or agents, including any negligent acts or omissions.

Consultant is not City's employee and Consultant shall have no authority, express or implied, to act on behalf of the City as an agent, or to bind the City to any obligation, unless the City provides prior written authorization. Consultant is free to work for other entities while under contract with the City. Consultant, and its agents or employees, are not entitled to City benefits. Consultant shall be solely responsible for, and shall save the City harmless from, all matters relating to the payment of Consultant's employees, agents, subcontractors and subconsultants, including compliance with social security requirements, federal and State income tax withholding and all other regulations governing employer-employee relations. The City reserves the right to contract with other firms and/or consultants during the term of this Agreement to provide the City the same or similar services that Consultant is providing to the City under this Agreement. Nothing contained in this Agreement guarantees Consultant a certain amount of work, and the City may, in its sole and absolute discretion, allocate and/or delegate work to Consultant so as to satisfy the City's needs.

10. Conflicts of Interest. Consultant (including its employees, agents, and subconsultants) shall not maintain or acquire any direct or indirect interest that conflicts with the performance of this Agreement. If Consultant maintains or acquires such a conflicting interest, the City may terminate any contract (including this Agreement) involving Consultant's conflicting interest.

11. Rebates, Kickbacks, or Other Unlawful Consideration. Consultant warrants that this Agreement was not obtained or secured through rebates, kickbacks, or other unlawful consideration either promised or paid to any City official or employee. For any breach of this warranty, City shall have the right, in its sole discretion, to terminate this Agreement without liability; to pay only for the value of the work actually performed; to deduct from the contract price the value of the rebate, kickback, or other unlawful consideration; or otherwise recover the full amount of such rebate, kickback, or other unlawful consideration.

12. Notices. All notices, demands, or other communications which this Agreement contemplates or authorizes shall be in writing and shall be personally delivered or mailed to the other party to the addresses listed below. Communications shall be deemed to have been given and received on the first to occur of: (1) actual receipt at the address designated below, or (2) three working days after the deposit in the United States Mail of registered or certified mail, sent to the address designated below.

13. Miscellaneous.

13.1 Standard of Care. Unless otherwise specified in this Agreement, the standard of care applicable to Consultant's services will be the degree of skill and diligence ordinarily used by reputable professionals performing in the same or similar time and locality, and under the same or similar circumstances.

13.2 Amendments. This Agreement may not be modified orally or in any manner other than by an agreement in writing signed by both Parties.

13.3 Waivers. Waiver of a breach or default under this Agreement shall not constitute a continuing waiver or a waiver of a subsequent breach of the same or any other provision of this Agreement. No waiver shall be effective unless it is in writing and signed by the waiving party.

13.4 Assignment and Delegation. Consultant may not assign, transfer or delegate this Agreement or any portion of it without the City's prior written consent. Any attempt to do so will be void. City's consent to one assignment, transfer or delegation shall not be deemed to be a consent to any subsequent assignment, transfer or delegation.

13.5 Jurisdiction and Venue. The interpretation, validity, and enforcement of the Agreement shall be governed by and construed under the laws of the State of California. Any suit, claim, or legal proceeding of any kind related to this Agreement shall be filed and heard in a court of competent jurisdiction in the County of San Joaquin.

13.6 Compliance with the Law. Consultant shall comply with all applicable local, state, and federal laws, whether or not those laws are expressly stated in this Agreement.

13.6.1 Prevailing Wage Laws. Consultant is aware of the requirements of California Labor Code Section 1720, et seq., and 1770, et seq., as well as California Code of Regulations, Title 8, Section 16000, et seq., ("Prevailing Wage Laws"), which require the payment of prevailing wage rates; employment of apprentices (§ 1777.5), certified payroll records (§1776), hours of labor (§1813 and §1815), debarment of contractors and subcontractors (§1777.1) and the performance of other requirements on "public works" and "maintenance" projects. If the services being performed under this Agreement are part of a "public works" or "maintenance" project, as defined in the Prevailing Wage Laws, and if the total compensation is $1,000 or more, Consultant agrees to fully comply with such Prevailing Wage Laws. These prevailing rates are on file with the City and are available online at http://www.dir.ca.gov/DLSR. Consultant shall defend, indemnify and hold the City, its officials, officers, employees and agents, harmless from any and all claims, costs, penalties, or interests arising out of any failure or alleged failure to comply with the Prevailing Wage Laws.

13.6.2 Non-discrimination. Consultant represents and warrants that it is an equal opportunity employer and it shall not discriminate against any subconsultant, employee or applicant for employment because of race, religion, color, national origin, handicap, ancestry, sex or age. Consultant shall also comply with all applicable anti-discrimination federal and state laws, including but not limited to, the California Fair Employment and Housing Act (Gov. Code 12990 (a-f) et seq.).

13.7 Business Entity Status. Consultant is responsible for filing all required documents and/or forms with the California Secretary of State and meeting all requirements of the Franchise Tax Board, to the extent such requirements apply to Consultant. By entering into this Agreement, Consultant represents that it is not a suspended corporation. If Consultant is a suspended corporation at the time it enters this Agreement, City may take steps to have this Agreement declared voidable.

13.8 Business License. Before the City signs this Agreement, Consultant shall obtain a City of Tracy Business License. Consultant shall maintain an active City of Tracy Business License during the term of this Agreement.

13.9 Successors and Assigns. This Agreement shall inure to the benefit of and be binding upon the Parties hereto and their respective successors and assigns.

13.10 Construction of Agreement. Each Party hereto has had an equivalent opportunity to participate in the drafting of this Agreement and/or to consult with legal counsel. Therefore, the usual construction of an agreement against the drafting Party shall not apply hereto.

13.11 Severability. If a term of this Agreement is held invalid by a court of competent jurisdiction, the Agreement shall be construed as not containing that term, and the remainder of this Agreement shall remain in effect.

13.12 Controlling Provisions. In the case of any conflict between the terms of this Agreement and the Exhibits hereto, and Consultant's proposal (if any), the Agreement shall control. In

the case of any conflict between the Exhibits hereto and the Consultant's proposal (if any), the Exhibits shall control.

13.13 Entire Agreement. This Agreement and the attached Exhibits comprise the entire integrated understanding between the Parties concerning the services to be performed and the matters contemplated herein. This Agreement supersedes all prior negotiations, representations or agreements. All exhibits attached hereto are incorporated by reference herein.

13.14 **Counterparts**. City and Consultant agree that this Agreement may be executed in two or more counterparts, each of which shall be deemed an original.

13.15 **Expenses for Enforcement**. Consultant and City agree that the prevailing party's reasonable costs, attorneys' fees and expenses, including investigation fees and expert witness fees, shall be paid by the non-prevailing party in any dispute involving the terms and conditions of this Agreement.

14. Signatures. The individuals executing this Agreement on behalf of Consultant represent and warrant that they have the right, power, legal capacity and authority to enter into and to execute this Agreement on behalf of Consultant.

[SIGNATURES ON FOLLOWING PAGE]

The Parties agree to the full performance of the terms set forth in this Agreement and have caused this Agreement to be duly executed.

A Scope of Work, including personnel and time of performance (See Agreement sections 1 and 2.)
B Compensation (See Agreement section 3.)

EXHIBIT A - Scope of Work

The completion of the Short Range Transit Plan will be conducted as outlined in the following scope of work.

Planning Horizon
The planning horizon to be used by Consultant for the short- range transit plan is ten years. However, a longer planning horizon may be required if necessary to reflect significant capital replacement and/or rehabilitation that would not fall within the ten-year period (e.g., rolling stock, bus sub fleet). A longer planning horizon may also be required if necessary to capture the capital or operating budget implications of significant changes in service (e.g., rail extension coming online).

Public Outreach
Consultant must ensure that the public is included in the planning process. In order to ensure equity, diversity, and inclusion, FTA's Title VI Circular requirements pertaining to public outreach must be adhered to in this process.

Consultant must conduct a survey in association with developing the short-range transit plan. The focus of the survey is threefold: (1) to inform CITY, SJCOG, and interested stakeholders of the demographic profile of transit riders throughout San Joaquin County; (2) to provide information to CITY on the travel patterns and characteristics of their customers; and, (3) to provide CITY, SJCOG, and interested stakeholders with robust estimates of transit origin/destination patterns, which are important to analytical planning efforts.

In addition and at a minimum, the following public meetings must be carried out by Consultant as part of the outreach process:

- Conduct at least four (4) public outreach meetings to obtain system needs and present any changes to future service. One (1) of these meetings should be with the Transportation Advisory Commission to present draft information and receive their feedback on the direction of the plan.
- Conduct at least one (1) outreach meeting with the operations contract staff (MTM Transit) to obtain feedback and suggestions regarding the current operations
- Conduct at least one (1) outreach meeting with the Tracy Unified School District to discuss transportation for students.
- Provide at least one (1) presentation to the Transportation Advisory Commission, and at least one (1) presentation to the Tracy CITY Council. The presentations must be held during the release of the final draft of the plan.

Final Document Contents

The short-range transit plan must contain at least the information described below in addition to other information commonly included in short-range transit plans, requested by the City, or required by any oversight agency or state, federal or local laws and regulations.

Overview of Transit System

Brief Agency History

Information should include, but is not limited to:

- Year of formation
- Existing Service Profile
- Facilities and fleet development
- Changes in service focus areas
- Key milestones and events (e.g., COVID).

Governance.

1. Type of unit of government (e.g., city, county, joint powers authority, transit district).
2. Composition and nature of representation of governing body:
    a. Number of members
    b. Elected or appointed (if appointed, how, and what agencies and/or groups do members represent (e.g., cities, county, general public)
    c. Current members and terms

Transit Services Provided and Areas Served

Describe all transit service provided (including, without limitation, fixed route, demand responsive, and connecting services and areas served, and the number of vehicles required for each type of service.)

Revenue Fleet

Provide a general description of the revenue vehicle fleet. The description can be in narrative or graphic format, or a combination of both. (This description differs from the detailed inventory required under Section 6 of these guidelines.) The discussion of revenue fleet must include, at a minimum, the following information:

1. Types of vehicles operated (e.g., standard bus (any length), articulated bus, cutaway van, standard van, heavy rail, light rail);
2. Number of each type of vehicle
3. Recognizing that each type of vehicle might be used in multiple types of service, type(s) of service in which each type of vehicle is used (e.g., local, express, commuter, demand responsive).

Existing Facilities

Describe individual or grouped facilities, according to the categories listed below.

1. Administrative (locations, age, functions located within)
2. Maintenance and Fueling (type, locations, age)
3. Vehicle Storage/Staging (locations, age, capacity)
4. Park-and-Ride (locations, age, capacity)
5. Stations and Stops (type, locations, age, basic amenities)
6. Right-of-Way, Track or Guideway
7. Bicycle Facilities

Service and System Evaluation

A. Evaluate route-level and system-wide performance against current service standards (if illustrative, portray local, express or commuter service, or other intercity service separately). Describe the evaluation process. Evaluate the most recent year for which complete data is available. At a minimum, evaluate performance measures relating to effectiveness and efficiency. Key performance measures could include passengers per revenue vehicle hour, passengers per revenue vehicle mile, percent of capacity used, revenue to total vehicle hours, operating cost per revenue vehicle hour, operating cost per passenger, and on-time performance. A retrospective portrayal of performance (e.g., prior five to ten years) may be warranted to exemplify trends. Where the evaluation identifies deviations from service standards, describe proposed remedies, including service expansion and/or contraction.

B. Identify paratransit services provided in compliance with the paratransit provisions of the Americans with Disabilities Act (ADA). Reference planned new activities, major service changes, or procurement of capital equipment to support ADA or other paratransit, dial-a-ride or demand responsive services. Identify other paratransit services with which services are coordinated, and any proposed revisions or improvements to fixed route services intended to enhance their usage by seniors and/or by persons with disabilities. Reference to participation in the ACCESS San Joaquin (ASJ) Technical Advisory Committee (TAC) and ASJ series is welcomed.

C. Provide the date of the agency's most recent federal Title VI analysis and report and discuss any service deficiencies identified in the report. Generally, describe the process used for complying with FTA Circular C4702.1B. Please reference the most recent triennial Title VI report, plus any subsequent Title VI reports.

D. Provide the dates of the agency's most recent FTA Triennial Review and TDA Triennial Performance Audit, and describe related remedial actions undertaken or currently underway in response to the review.

E. Provide a description of the goals and objectives achieved that were outlined in the last SRTP, along with accomplishments that may have not been outlined, but were achieved due to circumstance.

F. Outline efforts to improve intercity and interregional transit connectivity with transit operators of neighboring counties with a focus of providing transit access from/through San Joaquin County and to major employment centers in/outside of the county. Specifically provide a plan to connect with the future Valley Link service as well as enhancing connectivity with the Altamont Commuter Express (ACE).

Goals and Standards

Describe the process for establishing, and updating agency goals and how the agency plans to meet state and federal standards. Goals and standards should be divvied up by time such as short-range (less than 5 years) and long range (beyond 5 years). Please keep in mind the goals, and standards should aim toward addressing state and federal mandates, including, but not limited to, performance-based planning and programming and Senate Bill 743.

Goals should be comprehensive and refer to the major areas of concern for public transit operators, including principles and guidelines under which new or modified service would be implemented.

Examples include, but not limited to:

- SJCOG's RTP/SCS goals
- Sustainability (energy) and climate resiliency (emergency preparedness)
- Statutory and regulatory compliance (Supporting FTA's and FHWA's national transportation goals)
- Levels of service
- Funding and reserve policies
- Scheduling and Route Planning (headways/frequency)
- Environmental and Social Justice (Serving DACs and Households w/ No vehicles)
- Customer Service
- Interregional and Intercity Service
- Deadhead reduction
- Fares and transfer

Performance standards should at least refer to performance-based planning and programming targets identified in supplemental planning or policy documents. Service standards should be specific, measurable, and quantified where feasible.

Address performance-based planning and programming targets:

- Congestion via PM 3
- Asset Management via PM 2 / TAM
- Safety via PM 1 / PTASP
- Title VI Requirements
- Alternative Fuel Deadline and Approach
- Policies and strategies aimed at meeting SB 743

Operations Plan and Budget

Operations Plan

The operations plan sets forth the intentions to provide fixed route, on demand, and paratransit services over the SRTP period, and divvied up between short-range (less than 5- years) and long-range (beyond 5 years). Document the ongoing evaluation of services and systems with respect to adopted goals and standards, subject to financial constraints.

Explain how the operations plan meets federal, state, and local expectations/requirements.

i. Portray the levels of service planned — Use a table (or other graphic format) to portray planned levels of service hours and service miles. Separately identify the following:

1. Fixed route modes by type (e.g., local, express/commuter).
2. Demand responsive modes by type (e.g., ADA, non-ADA older adult, VanGO).
3. Major planned service expansions.

The table (or other graphic format) shall clearly identify service expansion and/or reduction by the year of planned deployment (expansion) and/or elimination (reduction). There shall be a rational relationship between the information portrayed and the "Service and System Evaluation" section of the SRTP.

ii. Describe and discuss planned (not yet implemented or underway) service changes in response to the most recent federal Title VI report, FTA Triennial Review and/or TDA Triennial Performance Audit.

Operations Budget

Demonstrate that planned level of transit service over the planning period, including rehabilitation and replacement of capital assets, is sustainable. Take into consideration expense forecasts, regional and local revenue projections, fare policies, labor or service agreements, competitive demands on funding, regional priorities, and policies.

The budget should reflect a "baseline" level of service, taking into consideration the existing level of service at the time of publication of the SRTP. Committed service changes must also be defined, with their expenses and revenue separately identified in the operating and capital financial plan tables. Provide sufficient detail to allow a reviewer of the SRTP to evaluate costs of implementing the operating and capital plans and compare the total with anticipated revenues available during the study period.

The narrative must specifically explain, and the spreadsheet clearly isolate in the appropriate year, by mode, any major change in service hours and miles due to deployment of new service or major service reductions.

All operations expenses and revenues are to be stated in year of expenditure dollars, with the assumed escalation factors stated. All sources of revenue shown in the operations and in the capital financial plan should be identified individually. All assumptions that relate to expenditure and revenue estimates must also be documented, including specification of ridership or sales growth (if appropriate) separately from inflation forecasts.

A spreadsheet format will be provided to be filled in with the relevant budget information.

Capital Improvement Program (Project List)

A. Describe and discuss the capital programs (vehicles, facilities, and equipment) required to carry out the operations and services set forth in the operating plan and budget. The Capital Improvement Plan (CIP) should provide the basis for requests for federal, state, and regional funding for capital replacements, rehabilitation, and expansion projects.

   The CIP should be divvied up into short-range (less than 5 years) and long-range projects (beyond 5 years), the short-range project must be financially constrained, where the long-range projects do not need to be. The long-rang, however, should reflect the operator's reasonable expectation of funding, particularly as outlined in SJCOG's Regional Transportation Plan.

B. Describe/list short-range major facilities replacement, rehabilitation, upgrade, and expansion projects of the types listed below. Identify the locations of new or expanded facilities. Provide project budget, including costs, sources of funds and amounts from each source, identifying funds that have been programmed, allocated or received, and funds that have not been secured. Separately describe security projects. Specify if replacement and rehabilitation of facilities and equipment results in an asset that differs from the existing asset.

- Administrative.
- Maintenance and Fueling.
- Vehicle Storage/Staging.
- Park-and-Ride.
- Stations and Stops.
- Right-of-Way, Track, or Guideway.
- Bicycle Facilities (e.g., lockers).

C. Transit Asset Management: Briefly describe any efforts to employ a systemic asset management program. Include current/past achievements and plans to upgrade or improve management (e.g. software tools, applications, business processes, integration into decision making processes). Agencies shall provide a brief statement and attach TAM Plan as an appendix.

Miscellaneous

- Progress meetings may be requested during the duration of the Project by the City or Consultant, but such progress meeting must, at a minimum, be held two (2) times per month.
- Consultant must provide meeting minutes and notes to City staff within five (5) business days after each meeting.
- Draft Plan: Consultant shall provide the City with at least five (5) Bound Hardcopies and Data Copy in Microsoft Word format.
- Final Draft Plan: Consultant shall provide the City with at least five (5) Bound Hardcopies and Data Copy in Microsoft Word format.
- Final Plan (post City Council approval): Consultant shall provide the City with at least ten (10) Bound Hardcopies, PDF format, and Data Copy in Microsoft Word format.
- The Consultant shall ensure compliance with all Federal, State and regional planning and study requirements in plan development.

TRACY CITY COUNCIL

RESOLUTION NO. _____

AUTHORIZING THE APPROVAL OF A PROFESSIONAL SERVICES AGREEMENT WITH CHS CONSULTING, INC. IN A NOT-TO-EXCEED AMOUNT OF $140,243 TO COMPLETE A SHORT RANGE TRANSIT PLAN FOR THE TRACER PUBLIC TRANSIT SYSTEM

WHEREAS, in May of 2023, the San Joaquin Council of Governments (SJCOG) adopted Short Range Transit Plan (SRTP) Guidelines which require local transit operators to complete an updated SRTP every five years, which is then used to develop a Regional Transit Systems Plan; and

WHEREAS, the City of Tracy adopted their most recent SRTP in August of 2019; and

WHEREAS, according SJCOG's SRTP Guidelines, the City of Tracy must submit an updated SRTP in 2024 or 2025;

WHEREAS, it will take approximately 12 months to complete the SRTP, which will allow for the City to meet SJCOGs guidelines; and

WHEREAS, this project was approved as CIP 77591 in the adopted FY23/24 Budget; and

WHEREAS, this project was solicited for proposals on August 4, 2023 and one proposal was received by the deadline of September 1, 2023; and

WHEREAS, staff has evaluated the proposal and determined that it was responsive to the City's needs; and

NOW, THEREFORE, be it resolved as follows:

RESOLVED: That the above recitals are true and correct; and be it

FURTHER RESOLVED: That the City Council of the City of Tracy hereby approves a Professional Services Agreement with CHS Consulting, Inc. in a not-to-exceed amount of $140,243 to complete a Short Range Transit Plan for the Tracer Public Transit System.

City of Tracy, California

November 7, 2023

Agenda Item 1.D

RECOMMENDATION

The Tracy Homelessness Advisory Committee recommend that City Council adopt a Resolution: 1) Authorizing the acceptance of a grant award from Health Plan of San Joaquin in the amount of $595,000 to partially fund the continued operation of the Tracy Interim Shelter Site; and 2) Appropriating the total grant funds to the Mobility and Housing Department, Homeless Services Division budget.

EXECUTIVE SUMMARY

This item provides Council with an opportunity to receive a grant award in the amount of $595,000 from Health Plan of San Joaquin for the Tracy Interim Shelter Site project (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility). This grant is funded by Health Plan of San Joaquin County and is in support of providing additional housing options within specific geographic areas that do not currently have projects that support those experiencing homelessness and who are also Medi-Cal beneficiaries.

The Tracy Homelessness Advisory Committee heard this item on October 19, 2023 and recommended that the City Council adopt the proposed Resolution.

BACKGROUND AND LEGISLATIVE HISTORY

The Tracy Interim Shelter Site project (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility) was authorized in August 2022 under an emergency shelter declaration to advance the needs to house the unsheltered in Tracy. On August 16, 2022, staff recommended that City Council reject the single bid received for the Temporary Emergency Housing Facility Project on Arbor Avenue, Site Improvements Construction Package 2 (renamed Phase II), CIP 71112, and authorize staff to re-advertise the project and rebid of the project. As this created a delay, the City Council adopted Resolution No. 2022-121 (“Resolution”), which reaffirmed an emergency shelter crisis as the City of Tracy continues to experience an increasing number of unsheltered individuals. Under this authorization, the City Manager entered into a five-year lease agreement for Modular Units and an Administration Unit, that will provide approximately 48 beds for individuals; and a one-year lease for generators. This project has been renamed Phase III of the Temporary Emergency Housing Facility. In addition, the City Manager purchased eight Custom Containers to provide approximately 38 beds for individuals. This project has been renamed Phase IV of the Temporary Emergency Housing Facility.

In May of 2023, Health Plan of San Joaquin met with the City’s Homeless Services Manager to discuss additional funding availability for our Tracy Interim Shelter project. Health Plan of San Joaquin requested a proposal outlining the additional funding needs for the Tracy Interim Shelter Site project (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility). In early June of 2023 the City was notified of the additional award in the amount of $595,000 to fund additional needs at the Tracy Interim shelter site.

ANALYSIS

The Tracy Interim Shelter Site (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility) project is part of the overall shelter campus project, parts of which are in various phases of design, development, and/or construction. This grant funding will be used to cover capital expenses, including the eight custom container units, existing modulars, and operating costs that will ultimately house up to 38 individuals. This project is intended to provide a site for those seeking shelter within the City limits. To that end, the City of Tracy will collaborate with the Health Plan of San Joaquin to provide additional resources and support to the City's unsheltered population as they are housed. Approval of this item will accept the grant.

FISCAL IMPACT

The Mobility and Housing Department, Homeless Services Division will receive $595,000 in grant funds from the Health Plan of San Joaquin to fund the Tracy Interim Shelter Site. The $595,000 grant is to be appropriated to the FY2022-23 Homeless Services division operating budget. No City match is required.

Vendor	Summary	Not to Exceed Amount
PowerGen	Generator monthly rentals and maintenance through May 2024	$40,000
SC Fuels	February 2023 through May 2024 fuel costs	$250,000
United Fence Services	Temporary fencing until permanent fencing installed	$200,000
United Site Services	Temporary Rental of Restroom for Phase IV through May 2024	$105,000
	TOTAL	$595,000

CEQA DETERMINATION

A CEQA determination is not required for this item.

STRATEGIC PLAN

This agenda item supports City Council's Homelessness Strategic Plan.

ACTION REQUESTED OF THE CITY COUNCIL

The Tracy Homelessness Advisory Committee recommend that City Council adopt a Resolution: 1) Authorizing the acceptance of a grant award from Health Plan of San Joaquin in the amount of $595,000 to partially fund the continued operation of the Tracy Interim Shelter Site; and 2) Appropriating the total grant funds to the Mobility and Housing Department, Homeless Services Division budget.

ATTACHMENTS:
Attachment A – City of Tracy MOU Health Plan of San Joaquin

Attachment A

MEMORANDUM OF UNDERSTANDING
BETWEEN
HEALTH PLAN OF SAN JOAQUIN
AND
CITY OF TRACY

THIS MEMORANDUM OF UNDERSTANDING ("MOU") is made and entered into the 14th day of September 2023 by and between the SAN JOAQUIN COUNTY HEALTH COMMISSION, operating and doing business as HEALTH PLAN OF SAN JOAQUIN ("HPSJ"), a local initiative established under Section 5-7100 of the Ordinance Code of San Joaquin County, with a principal place of business at 7751 South Manthey Road, French Camp, CA 95231-9802 and City of Tracy ("City"), with a principal place of business at 333 Civic Center Plaza, Tracy, CA 95376.

The purpose of this MOU is to establish guidelines for a cooperative working relationship between HPSJ and City for successful implementation of incentive payments linked to the Housing and Homelessness Incentive Program ("HHIP").

Whereas, as part of efforts to meet HHIP priorities and measures, HPSJ will partner with local partners and organizations which deliver housing, or supportive services to Medi-Cal members who are homeless or at risk of homelessness.

Whereas, City provides housing, or supportive services to address homelessness or housing insecurity for HPSJ Medi-Cal members.

Whereas, City's project(s) have been identified as an investment activity based on the City's HHIP initial project submission.

Whereas, HPSJ is responsible for oversight and administration of payments to City consistent with the terms of the HHIP.

NOW, THEREFORE, IT IS AGREED between the parties as follows:

1) EFFECTIVE DATE AND TERM

   a. This MOU shall be effective July 14, 2023, and will continue through and including March 31, 2024 or dates determined by the Department of Health Care Services ("DHCS"), unless otherwise terminated by either party to this MOU as prescribed in paragraph 8.

2) SCOPE OF WORK

a. City is responsible for the implementation of and compliance with the HHIP project description set forth in its Exhibit A, which is herein incorporated by reference, including reporting of incremental achievement of milestones and objectives. City shall promptly notify HPSJ of any material change in information submitted in support of the project(s) or the HHIP application, including changes in organizational leadership, business operations, and financial standing. HPSJ is responsible for overseeing the project(s), specifically to monitor and verify milestone achievement and administering payments consistent with the terms of the project(s) or the HHIP application, any terms imposed as a condition of state or federal approval of the HHIP, and any subsequent DHCS guidance related to HHIP.

3) RESPONSIBILITIES OF CITY

City shall provide the following:

a. Assist HPSJ in identifying key details for investments including but not limited to populations served, services and activities, community needs, required funding, lead entities, milestones, and timing.

b. Commit to identified HHIP projects, complete required application and documents and accept incentive funding for specified investments in support of the provision of housing and homelessness related services to HPSJ Medi-Cal members.

c. Utilize HHIP incentive funding solely for identified and agreed upon investments and activities and for carrying out project activities and milestones as set forth in approved projects.

d. Cooperate and facilitate engagement and implementation activities in support of HHIP goals and measures.

e. Perform tasks necessary to projects or milestones for HHIP. City shall document and provide HPSJ with information necessary to demonstrate incremental progress in for HHIP goals and measures in a file or format as specified by HPSJ.

f. Promptly notify HPSJ of any material change in information including changes in organizational leadership, business operations, and financial standing.

g. Make efforts to establish data sharing agreements as applicable to enable timely exchange of member information and delivery of services.

h. City shall ensure eligibility to receive the funds and non-duplication with other federal or state funding sources.

i. Agree to comply with all applicable state and federal laws and regulations, MOU requirements, DHCS guidance, including All Plan Letters (“APLs”) and Policy Letters (“PLs”), and contractual terms and conditions as imposed by DHCS.

j. City shall make all premises, facilities, equipment, books, records, papers, and contracts, computer systems available for inspection, examination or copying for purposes of an audit or monitoring.

4) RESPONSIBILITIES OF HPSJ

HPSJ shall provide the following:

a. Support partnerships between social service agencies, counties, and public health agencies, and public and community-based housing agencies in support of the HHIP goals and as efforts to address homelessness.

b. Oversee project(s), including monitoring and verifying milestone achievement and administering payments consistent with the terms of the project(s) or the HHIP submission, and any subsequent state, federal, or DHCS guidance.

c. Collect and evaluate information related to City's project(s) for the purposes of ensuring progress toward City's goals and objectives, program achievement and reporting to DHCS.

d. HPSJ will report to the DHCS on the project status in accordance with required HHIP submissions and deliverables and as required by DHCS.

e. HPSJ is responsible for the administration of HHIP funds as set forth in section 5 below.

5) FUNDING

a. HPSJ will make incremental payments on agreed upon projects or investments as provided in Exhibit A. HPSJ will initiate processing of payments to City upon receipt of all required documents and updates.

b. The specified projects will be deemed complete and fully funded only when milestones as set forth in Exhibit A have been met.

c. There is no guarantee of funding. Funding paid by HPSJ to City may be subject to recoupment for reasons including but not limited to: failure to participate, failure to engage in minimum level of efforts, or any overpayment as identified by HPSJ. Upon receipt of HPSJ's written notification that such failures or overpayment have occurred, City shall promptly return the funds noted for recoupment in the notification, unless City disputes the recoupment, in which case the parties shall engage in good faith negotiations for a period of thirty (30) days to resolve such issues.

d. HPSJ may adjust milestone measurement and related payments as needed and may delay payment for non-reporting or non-compliance with program terms. HPSJ will not make any milestone payment until all past due reporting is complete.

e. Proposed funding as outlined within Exhibit A is based on information known and available to HPSJ and may be modified in accordance with payments made by DHCS and new developments.

6) LIAISON

HPSJ and City will each designate a liaison(s) to serve as a point of contact of activities performed related to this MOU.

7) MOU MONITORING

HPSJ and City will meet on a mutually agreed upon frequency, or upon request to monitor the performance of parties' responsibilities related to this MOU.

8) REPRESENTATIONS

Both parties to this MOU make the following representations, which are agreed to be material to and form a part of the inducement for this MOU:

a. HPSJ and City have the support staff and facilities necessary to provide the services described in this MOU; and

b. HPSJ and City have the expertise and authority to provide the services described in this MOU.

9) ASSIGNMENT

This MOU is not assignable.

10) COMPENSATION

Each party will be responsible for its own costs and fees.

11) INDEMNIFICATION

Each party agrees that it shall indemnify, defend and hold harmless the other party, its agents, elected officials, officers, volunteers, authorized representatives, and employees from any and all losses, liabilities, costs, expenses, charges, damages, claims, liens, and causes of actions, or whatsoever kind of nature, including, but not limited to, reasonable attorney's fees, which are in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, through any act, omission, fault, or negligence, whether active or passive, of said party or said party's officers, agents, employees, or authorized representatives, which relates in any manner to this MOU, any work to be performed by said party arising from the operation of this MOU, of any authorized delegated to said party

under this MOU, except those injuries or damages that are the result of willful acts or the sole negligence of the other party, its officers, agents, or employees.

12) TERMINATION

This MOU may be terminated for the following reasons:

a. **For Cause.** If any party materially breaches the terms of this MOU, the other party shall have the following alternative remedies:

i. Immediately terminate the MOU, if the non-breaching party reasonably believes the breach cannot be cured.

ii. Provide the breaching party with written notice of non-breaching party's intent to terminate the MOU, unless the breach is cured to the non-breaching party's satisfaction within thirty (30) days. The parties shall engage in good faith negotiations to resolve such issues during such 30-day period.

iii. All other remedies provided by law.

iv.

b. **For Convenience.** Either party to this MOU may for any reason or no reason terminate this MOU at any time by giving the other party thirty (30) days written notice of such termination. Termination shall have no effect upon the rights and obligations of the parties arising out of any transaction occurring prior to the effective date of such termination.

c. **Non-Appropriation.** HPSJ reserves the right to terminate this MOU in the event insufficient funds are appropriated or budgeted for this MOU in any fiscal year. Upon such termination, thirty (30) days written notice will notify parties that such an action is required by HPSJ.

If this MOU is completely or partially terminated, the records or data relating to the work terminated shall be transferred to HPSJ within five working days and be permanently removed from City's electronic system to the extent permitted by law.

13) NOTICES

Notices to be given by one party to the other under this MOU shall be given in writing by email, personal delivery, by certified mail, return receipt requested, or express delivery service at the addresses specified below. Notices delivered personally shall be deemed received upon receipt; mailed or expressed notices shall be deemed received four (4) days after deposit. A party may change the address to which notice is to be given by giving notice as provided above.

14) SOLE MOU

This document, including all attachments hereto, contains the entire MOU between the parties relating to the services, rights, obligations and covenants contained herein and assumed by the parties respectively. No inducements, representations or promises have been made, other than those recited in this MOU. No oral promise, modification, change or inducement shall be effective or given any force or effect.

15) MODIFICATIONS OF MOU

This MOU may be modified in writing only, signed by the parties in interest at the time of the modification.

16) CONFIDENTIALITY

a. The HPSJ and City collaboration in support of project(s) may require the exchange of confidential or proprietary information ("Confidential Information") as may be identified by either party. HPSJ and City agree to abide by processes and requirements applicable to the exchange of either's respective confidential information, in accordance with applicable state or federal law, including but not limited to the California Public Records Act. City shall adhere to all HIPAA regulations outlined in HIPAA Business Associate Agreement.

b. The parties shall comply and require its officers, employees, agents, and/or subcontractors to comply with the provisions of Welfare and Institutions Code Section 10850 which requires the confidentiality of applications and records concerning individuals receiving public social services to ensure that:

   i. The applications and records of all individuals made or kept by a public officer or agency in connection with the administration of the provisions of the Welfare and Institutions Code relating to any form of public social services for which grants in aid are received by the State or Federal government will be confidential and will not be open to examination for any purpose not directly connected with the administration of public social services or as required by law; and

   ii. No person will publish or disclose, or use or permit, or cause to be published, disclosed, or used, any confidential information pertaining to an applicant or recipient of public social services.

iii. The parties shall inform all officers, employees, agents and/or subcontractors of the above requirements and that any person knowingly and intentionally violating the provisions of State law is guilty of a misdemeanor.

17) GOVERNING LAW

Both parties shall observe and comply with all applicable County, State and Federal laws, ordinances, rules and regulations now in effect or hereafter enacted, each of which are hereby made a part hereof and incorporated herein by reference. The parties further agree this MOU shall be governed by California law.

18) NONDISCRIMINATION

Both Parties shall observe and comply with all applicable county, state and federal laws, ordinances, rules, and regulations now in effect or hereafter enacted, each of which are hereby made a part hereof and incorporated herein by reference. These laws include, without limitation, those pertaining to nondiscrimination and confidentiality of personal health information.

19) CONFLICTS OF INTEREST

Both parties shall observe and comply with all Government Code sections and the following:

a. The parties have read and are aware of the provisions of Sections 1090 et seq. and 87100 et seq. of the Government Code relating to conflict of interest of public officers and employees and agree to be bound thereby. The parties certify that they are unaware of any financial or economic interest of any public officer or employee relating to this MOU. It is further understood and agreed that if such a financial interest does exist at the inception of this MOU, the parties may immediately terminate this MOU by giving written notice thereof.

b. The parties certify that its employees and officers of its governing body shall avoid any actual or potential conflicts of interest and that no officer or employee who exercises any functions or responsibilities in connection with this MOU shall have any personal financial interest or benefits which either directly or indirectly arises from this MOU.

c. The parties shall establish safeguards to prohibit its employees or its officers from using their positions for a purpose that could result in private gain or that gives the appearance of being motivated for private gain for themselves or others, particularly those with whom they have family or business ties.

20) SIGNATURE AUTHORITY

Each party represents that they have full power and authority to enter into and perform this MOU, and the person signing this MOU on behalf of each party has been properly authorized and empowered to enter into this MOU.

[Signatures to Follow]

IN WITNESS TO WHICH, each party to this MOU has signed this MOU upon the date indicated, and agrees, for itself, its employees, officers, partners and successors, to be fully bound by all terms and conditions of this MOU.

TRACY CITY COUNCIL

RESOLUTION NO. _____

ADOPT A RESOLUTION: 1) AUTHORIZING THE ACCEPTANCE OF A GRANT AWARD FROM HEALTH PLAN OF SAN JOAQUIN IN THE AMOUNT OF $595,000 TO PARTIALLY FUND THE CONTINUED OPERATION OF THE TRACY INTERIM SHELTER SITE; AND 2) APPROPRIATING THE TOTAL GRANT FUNDS TO THE MOBILITY AND HOUSING DEPARTMENT, HOMELESS SERVICES DIVISION BUDGET.

WHEREAS, on May 16, 2023, the City of Tracy Homeless Services Manager met with the Health Plan of San Joaquin and discussed the housing needs of the unsheltered throughout the City, and the Health Plan of San Joaquin requested a proposal for the Tracy Interim Shelter Site; and

WHEREAS, on May 16, 2023, the City of Tracy submitted a proposal and budget to the Health Plan of San Joaquin in the amount of $595,000; and

WHEREAS, on June 1, 2023, Health Plan of San Joaquin notified the City of Tracy that the proposal submitted was selected for grant funding; and

WHEREAS, the Tracy Interim Shelter Site (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility) project is part of the overall shelter campus project, parts of which are in various phases of design, development, and/or construction; and

WHEREAS, the grant funding will be used to cover operating costs associated with monthly fuel and generator costs and temporary restrooms and fencing of Phase III and IV of the Temporary Emergency Housing Facility that will ultimately house up to 38 additional individuals, and the project is intended to provide a site for those seeking shelter within the City limits; and

WHEREAS, the City of Tracy will collaborate with the Health Plan of San Joaquin to provide additional resources and support to the City's unsheltered population as they are housed; and

WHEREAS, City match is not required; and

WHEREAS, The Tracy Homelessness Advisory Committee heard this item on October 19, 2023 and recommended that the City Council adopt the proposed Resolution; now, therefore, be it

RESOLVED: That the City Council hereby accepts the grant award from Health Plan of San Joaquin in the amount of $595,000 to partially fund operation costs of the Tracy Interim Shelter Site (renamed Phase III and Phase IV of the Temporary Emergency Housing Facility, CIP 71112); and be it

FURTHER RESOLVED: That the City Council hereby appropriates $595,000 of the total grant funds to the Mobility and Housing Department, Homeless Services Division.

Agenda Item 1.E

RECOMMENDATION

The Tracy Homelessness Advisory Committee recommend that the City Council adopt a Resolution (1) approving Amendment No. 1 to the General Services Agreement (Agreement) with United Fence Services, Inc., to extend the term of the Agreement through December 31, 2024 for the rental of fence panels, stands and safety brackets required at the Temporary Emergency Housing Facility (TEHF).

EXECUTIVE SUMMARY

Staff recommends that the Tracy Homelessness Advisory Committee recommend that the City Council adopt a Resolution (1) approving Amendment No. 1 to the General Services Agreement (Agreement) with United Fence Services, Inc., to modify Section 2.1 to extend the term of the Agreement through December 31, 2024 for the rental of fence panels, stands and safety brackets required at the Temporary Emergency Housing Facility (TEHF).

The proposed Amendment No. 1 (Attachment A) will extend the term of the General Services Agreement (GSA) with United Fence Services, Inc. (Consultant) through December 31, 2024 to provide the Temporary Emergency Housing Facility (TEHF) with rental of fence panels, stands and safety brackets. The Agreement not to exceed amount of $200,000, is unchanged.

The Tracy Homelessness Advisory Committee heard this item on October 19, 2023 and recommended that the City Council adopt the proposed Resolution.

BACKGROUND AND LEGISLATIVE HISTORY

On July 5, 2023, the City Council adopted Resolution No. 2023-138 approving an Agreement with United Fence Services, Inc., to provide rental fence panels, stands & safety brackets at the Temporary Emergency Housing Facility on Arbor Avenue.

Under Section 2.1 of the Agreement, the term of the Agreement ends on December 21, 2023. Amendment No. 1 extends the term of the Agreement to December 31, 2024.

ANALYSIS

The City plans to extend the rental fencing around the Temporary Housing Emergency Facility to better secure the construction areas and enhance security of the residents and staff at the shelter until the permanent fences are installed as part of the Phase II construction.

FISCAL IMPACT

Amendment No. 1 to the Agreement with United Fence Services, Inc. requires no additional funding. The Agreement is funded as part of the project Operations costs, funded by City of Tracy American Rescue Plan Act (ARPA) funds. The Amendment does not have any fiscal impact. The Agreement of the not-to-exceed amount of $200,000 is unchanged.

CEQA DETERMINATION

A Notice of Exemption was issued on October 16, 2020, for the Temporary Emergency Housing site at 500 Arbor Avenue in accordance with Government Code sections 65660-65662 for Low Barrier Navigation Centers and Section 15269(c) of the CEQA Guidelines (14 Cal. Code Regs. 15269(c) for (Emergency Projects). No environmental impacts beyond those already analyzed for the CIP exist; accordingly, no further CEQA analysis is needed.

STRATEGIC PLAN

This agenda item supports the Public Safety Strategic Priority, Implement the adopted Homelessness Strategic Plan.

ACTION REQUESTED OF THE CITY COUNCIL

The Tracy Homelessness Advisory Committee recommend that the City Council adopt a Resolution (1) approving Amendment No. 1 to the General Services Agreement (Agreement) with United Fence Services, Inc., to extend the term of the Agreement through December 31, 2024 for the rental of fence panels, stands and safety brackets required at the Temporary Emergency Housing Facility (TEHF).

Attachment A – Amendment No. 1 United Fence Services, Inc.
Attachment B – GSA United Fence Services, Inc.

CITY OF TRACY
AMENDMENT NO. 1 TO
General Services Agreement with United Fence Services, Inc. - Temporary Emergency Housing Facility Fence Rentals

This Amendment No. 1 (**Amendment**) to the General Services Agreement by and between the City of Tracy, a municipal corporation (**City**), and United Fence Services, Inc., a California corporation (Contractor) is being entered into on the date this Amendment is last executed. City and Consultant are referred to individually as "**Party**" and collectively as "**Parties**."

Recitals

A. The City and Contractor entered into a General Services Agreement for the provision of rental fence panels, stands and safety brackets at the Temporary Emergency Housing Facility, which was approved by the City Council on July 5, 2023 pursuant to Resolution No. 2023-13 (**Agreement**) 8.

B. The City and Contractor desire to amend the term of the Agreement by extending the expiration date of such term from December 31, 2023 to December 31, 2024.

C. This Amendment is being executed pursuant to Resolution No._____, which was approved by Tracy City Council on November 7, 2023.

Now therefore, the Parties mutually agree as follows:

1. Incorporation by Reference. Unless specifically modified by this Amendment, the Agreement shall remain unchanged and in full force and effect. By their signatures below, the Parties hereby ratify, approve, and confirm the Agreement remains in full force and effect. This Amendment incorporates by reference all terms set forth in the Agreement, unless specifically modified by this Amendment. All capitalized terms used herein and not defined herein shall have the meanings set forth in the Agreement.

2. Terms of Amendment.

A. Section 2.1 of the Agreement is hereby amended in its entirety to read as follows:

"**Term**. The term of this Agreement shall begin on November 1, 2022 and end on December 31, 2024, unless terminated in accordance with Section 6."

3. Signatures. This Amendment may be executed in any number of counterparts, each of which shall be deemed to be an original and all of which taken together shall constitute one instrument. The individuals executing this Amendment represent and warrant that they have the right, power, legal capacity and authority to enter into and to execute this Amendment. This Amendment shall inure to the benefit of and be binding upon the parties and their respective successors and assigns.

The Parties agree to the full performance of the terms set forth here.

CITY OF TRACY
GENERAL SERVICES AGREEMENT WITH
United Fence Services, Inc. – Temporary Emergency Housing Facility Fence Rentals

This General Services Agreement (**Agreement**) is entered into between the City of Tracy, a municipal corporation (**City**), and United Fence Services, Inc., a California corporation (**Contractor**). City and Contractor are referred to individually as "Party" and collectively as "Parties."

Recitals

A. City desires to retain Contractor to provide the Temporary Emergency Housing Facility (TEHF) with the rental of fence panels, stands and safety brackets; and

B. After negotiations between the City and Contractor, the Parties have reached an agreement for the performance of services in accordance with the terms set forth in this Agreement.

C. Pursuant to Resolution No. 2023-138, the City Council dispensed the procurement requirements for this Agreement under Tracy Municipal Code section 2.20.180, subsection (b)(4), and authorized execution of this Agreement.

D. This Agreement is being executed pursuant to Resolution No. 2023-138

Now therefore, the Parties mutually agree as follows:

1. Scope of Work. Contractor shall perform the services described in Exhibit "A" attached and incorporated by reference. The services shall be performed by, or under the direct supervision of, Contractor's Authorized Representative: United Fence Services, Inc. Contractor shall not replace its Authorized Representative, nor shall Contractor use or replace any subcontractors or subconsultants, without City's prior written consent. A failure to obtain the City's prior written consent for any change or replacement in personnel or subcontractor may result in the termination of this Agreement.

2. Time of Performance. Time is of the essence in the performance of services under this Agreement and the timing requirements set forth shall be strictly adhered to unless otherwise modified in writing in accordance with this Agreement. Any services for which times for performance are not specified in this Agreement shall be started and completed by Contractor in a reasonably prompt and timely manner based upon the circumstances and direction communicated to the Contractor. Contractor shall submit all requests for time extensions to the City in writing no later than ten days after the start of the condition which purportedly caused the delay, and not later than the date on which performance is due. City shall grant or deny such requests at its sole discretion.

2.1 Term. The term of this Agreement shall begin on November 1, 2022 and end on December 31, 2023, unless terminated in accordance with Section 6.

3. Compensation. City shall pay Contractor at the billing rates set forth in Exhibit "B" attached and incorporated by reference for services performed under this Agreement.

3.1 Not to Exceed Amount. Contractor's total compensation under this Agreement shall not exceed $200,000. Contractor's billing rates shall cover all costs and expenses for Contractor's performance of this Agreement. No work shall be performed by Contractor in excess of the total compensation amount provided in this section without the City's prior written approval.

3.2 Invoices. Contractor shall submit monthly invoices to the City that describe the services performed, including times, dates, and names of persons performing the services.

3.2.1. Contractor's failure to submit invoices in accordance with these requirements may result in the City rejecting said invoices and thereby delaying payment to Contractor.

3.3 Payment. Within 30 days after the City's receipt of invoice, City shall make payment to the Contractor based upon the services described on the invoice and approved by the City.

4. Indemnification. Contractor shall, to the fullest extent permitted by law, indemnify, defend (with independent counsel approved by the City), and hold harmless the City from and against any claims arising out of Contractor's performance or failure to comply with obligations under this Agreement, except to the extent caused by the sole, active negligence or willful misconduct of the City.

In this section, "City" means the City, its officials, officers, agents, employees and volunteers; "Contractor" means the Contractor, its employees, agents and subcontractors; "Claims" includes claims, demands, actions, losses, damages, injuries, and liability, direct or indirect (including any and all related costs and expenses) and any allegations of these; and "Arising out of" includes "pertaining to" and "relating to".

The provisions of this section survive completion of the services or the termination of this Agreement, and are not limited by the provisions of Section 5 relating to insurance.

5. Insurance. Contractor shall, throughout the duration of this Agreement, maintain insurance to cover Contractor, its agents, representatives, and employees in connection with the performance of services under this Agreement at the minimum levels set forth herein.

5.1 Commercial General Liability (with coverage at least as broad as ISO form CG 00 01 01 96) "per occurrence" coverage shall be maintained in an amount not less than $4,000,000 general aggregate and $2,000,000 per occurrence for general liability, bodily injury, personal injury, and property damage.

5.2 Automobile Liability (with coverage at least as broad as ISO form CA 00 01 07 97, for "any auto") "claims made" coverage shall be maintained in an amount not less than $1,000,000 per accident for bodily injury and property damage.

5.3 Workers' Compensation coverage shall be maintained as required by the State of California.

5.4 Professional Liability "claims made" coverage shall be maintained to cover damages that may be the result of errors, omissions, or negligent acts of Contractor in an amount not less than $1,000,000 per claim.

5.5 Endorsements. Contractor shall obtain endorsements to the automobile and commercial general liability insurance policies with the following provisions:

5.5.1 The City (including its elected officials, officers, employees, agents, and volunteers) shall be named as an additional "insured."

5.5.2 For any claims related to this Agreement, Contractor's coverage shall be primary insurance with respect to the City. Any insurance maintained by the City shall be excess of the Contractor's insurance and shall not contribute with it.

5.6 Notice of Cancellation. Contractor shall notify the City if the policy is canceled before the expiration date. For the purpose of this notice requirement, any material change in the policy prior to the expiration shall be considered a cancellation. Contractor shall immediately obtain a replacement policy.

5.7 Authorized Insurers. All insurance companies providing coverage to Contractor shall be insurance organizations authorized by the Insurance Commissioner of the State of California to transact the business of insurance in the State of California.

5.8 Insurance Certificate. Contractor shall provide evidence of compliance with the insurance requirements listed above by providing a certificate of insurance and endorsements, in a form satisfactory to the City, before the City signs this Agreement.

5.9 Substitute Certificates. Contractor shall provide a substitute certificate of insurance no later than 30 days prior to the policy expiration date of any insurance policy required by this Agreement.

5.10 Contractor's Obligation. Maintenance of insurance by the Contractor as specified in this Agreement shall in no way be interpreted as relieving the Contractor of any responsibility whatsoever (including indemnity obligations under this Agreement), and the Contractor may carry, at its own expense, such additional insurance as it deems necessary. Failure to provide or maintain any insurance policies or endorsements required herein may result in the City terminating this Agreement.

6. Termination. The City may terminate this Agreement by giving ten days' written notice to Contractor. Upon termination, Contractor shall give the City all original documents, including preliminary drafts and supporting documents, prepared by Contractor for this Agreement. The City shall pay Contractor for all services satisfactorily performed in accordance with this Agreement, up to the date notice is given.

7. Dispute Resolution. If any dispute arises between the City and Contractor that cannot be settled after engaging in good faith negotiations, City and Contractor agree to resolve the dispute in accordance with the following:

7.1 Each Party shall designate a senior management or executive level representative to negotiate the dispute;

7.2 The representatives shall attempt, through good faith negotiations, to resolve the dispute by any means within their authority.

7.3 If the issue remains unresolved after fifteen (15) days of good faith negotiations, the Parties shall attempt to resolve the disagreement by negotiations between legal counsel. If the aforementioned process fails, the Parties shall resolve any remaining disputes through mediation to expedite the resolution of the dispute.

7.4 The mediation process shall provide for the selection within fifteen (15) days by both Parties of a disinterested third person as mediator, shall be commenced within thirty (30) days and shall be concluded within fifteen (15) days from the commencement of the mediation.

7.5 The Parties shall equally bear the costs of any third party in any alternative dispute resolution process.

7.6 The dispute resolution process is a material condition to this Agreement and must be exhausted prior to either Party initiating legal action. This dispute resolution process is not intended to nor shall be construed to change the time periods for filing a claim or action specified by Government Code §§ 900 et seq.

8 Labor Code Compliance. Contractor is aware of the requirements of Chapter 1 of Part 7 of Division 2 of the California Labor Code and applicable regulations which require the payment of prevailing wage rates (§1771, §1774, and §1775); employment of apprentices (§1777.5), certified payroll records (§1776), hours of labor (§1813 and §1815), debarment of contractors and subcontractors (§1777.1) and the performance of other requirements on "public works" and "maintenance" projects. The services being performed under this Agreement are part of a "public works" or "maintenance" project, as defined in the Prevailing Wage Laws, Contractor agrees to fully comply with such Prevailing Wage Laws.

8.1 Rates. These prevailing wage rates are on file with the City and are available online at http://www.dir.ca.gov/DLSR. Each Contractor and Subcontractor must pay no less than the specified rates to all workers employed to perform the services described herein. The schedule of per diem wages is based upon a working day of eight hours. The rate for holiday and overtime work must be at least time and one-half. Contractor assumes all responsibility for such payments and shall defend,

indemnify and hold the City harmless from any and all claims made by the State of California, the Department of Industrial Relations, any subcontractor, any worker, or any other third party.

8.2 Registration with DIR. Contractor warrants that it is registered with the Department of Industrial Relations and qualified to perform the services consistent with Labor Code section 1725.5.

8.3 Monitoring. This Agreement will be subject to compliance monitoring and enforcement by the DIR, under Labor Code section 1771.4.

9. Ownership of Work. All original documents prepared by Contractor for this Agreement, whether complete or in progress, are the property of the City, and shall be given to the City at the completion of Contractor's services, or upon demand from the City. No such documents shall be revealed or made available by Contractor to any third party without the City's prior written consent.

10. Independent Contractor Status. Contractor is an independent contractor and is solely responsible for the acts of its employees or agents, including any negligent acts or omissions. Contractor is not City's employee and Contractor shall have no authority, express or implied, to act on behalf of the City as an agent, or to bind the City to any obligation, unless the City provides prior written authorization. Contractor is free to work for other entities while under contract with the City. Contractor, and its agents or employees, are not entitled to City benefits.

11. Conflicts of Interest. Contractor (including its employees, agents, and subcontractors) shall not maintain or acquire any direct or indirect interest that conflicts with the performance of this Agreement. If Contractor maintains or acquires such a conflicting interest, the City may terminate any contract (including this Agreement) involving Contractor's conflicting interest.

12. Rebates, Kickbacks, or Other Unlawful Consideration. Contractor warrants that this Agreement was not obtained or secured through rebates, kickbacks, or other unlawful consideration either promised or paid to any City official or employee. For breach of this warranty, City shall have the right, in its sole discretion, to terminate this Agreement without liability; to pay only for the value of the work actually performed; or to deduct from the contract price; or otherwise recover the full amount of such rebate, kickback, or other unlawful consideration.

13. Notices. All notices, demands, or other communications which this Agreement contemplates or authorizes shall be in writing and shall be personally delivered or mailed to the other party to the addresses listed below. Communications shall be deemed to have been given and received on the first to occur of: (1) actual receipt at the address designated below, or (2) three working days after the deposit in the United States Mail of registered or certified mail, sent to the address designated below.

14. Miscellaneous.

14.1 Standard of Care. Unless otherwise specified in this Agreement, the standard of care applicable to Contractor's services will be the degree of skill and diligence ordinarily used by reputable professionals performing in the same or similar time and locality, and under the same or similar circumstances.

14.2 Amendments. This Agreement may not be modified orally or in any manner other than by an agreement in writing signed by both Parties.

14.3 Waivers. Waiver of a breach or default under this Agreement shall not constitute a continuing waiver or a waiver of a subsequent breach of the same or any other provision of this Agreement.

14.4 Assignment and Delegation. Contractor may not assign, transfer or delegate this Agreement or any portion of it without the City's written consent. Any attempt to do so will be void. City's consent to one assignment shall not be deemed to be a consent to any subsequent assignment.

14.5 Jurisdiction and Venue. The interpretation, validity, and enforcement of the Agreement shall be governed by and construed under the laws of the State of California. Any suit, claim, or legal proceeding of any kind related to this Agreement shall be filed and heard in a court of competent jurisdiction in the County of San Joaquin.

14.6 Compliance with the Law. Contractor shall comply with all applicable local, state, and federal laws, whether or not those laws are expressly stated in this Agreement.

14.6.1 Hazardous Materials. Contractor is responsible for all costs of clean up and/or removal of hazardous and toxic substances spilled as a result of performing their services.

14.6.2 Non-discrimination. Contractor represents and warrants that it is an equal opportunity employer and it shall not discriminate against any subcontractor, employee or applicant for employment because of race, religion, color, national origin, handicap, ancestry, sex or age. Contractor shall also comply with all applicable anti-discrimination federal and state laws, including but not limited to, the California Fair Employment and Housing Act (Gov. Code 12990 (a-f) et seq.).

14.7 Business Entity Status. Contractor is responsible for filing all required documents and/or forms with the California Secretary of State and meeting all requirements of the Franchise Tax Board, to the extent such requirements apply to Contractor. By entering into this Agreement,

Contractor represents that it is not a suspended corporation. If Contractor is a suspended corporation at the time it enters this Agreement, City may take steps to have this Agreement declared voidable.

14.8 Business License. Before the City signs this Agreement, Contractor shall obtain a City of Tracy Business License. Contractor shall maintain an active City of Tracy Business License during the term of this Agreement.

14.9 Successors and Assigns. This Agreement shall inure to the benefit of and be binding upon the Parties hereto and their respective successors and assigns.

14.10 Construction of Agreement. Each Party hereto has had an equivalent opportunity to participate in the drafting of this Agreement and/or to consult with legal counsel. Therefore, the usual construction of an agreement against the drafting Party shall not apply hereto.

14.11. Severability. If a term of this Agreement is held invalid by a court of competent jurisdiction, the Agreement shall be construed as not containing that term, and the remainder of this Agreement shall remain in effect.

14.12 Controlling Provisions. In the case of any conflict between the terms of this Agreement and the Exhibits hereto, and Contractor's proposal (if any), the Agreement shall control. In the case of any conflict between the Exhibits hereto and the Contractor's proposal (if any), the Exhibits shall control.

14.13 Entire Agreement. This Agreement and the attached Exhibits comprise the entire integrated understanding between the Parties concerning the services to be performed. This Agreement supersedes all prior negotiations, representations or agreements. All exhibits attached hereto are incorporated by reference herein.

15. Signatures. The individuals executing this Agreement on behalf of Contractor represent and warrant that they have the right, power, legal capacity and authority to enter into and to execute this Agreement on behalf of Contractor.

[SIGNATURES ON FOLLOWING PAGE]

The Parties agree to the full performance of the terms set forth here.

RESOLUTION NO. _____

ADOPTING A RESOLUTION (1) APPROVING AMENDMENT NO. 1 TO THE GENERAL SERVICES AGREEMENT (AGREEMENT) WITH UNITED FENCE SERVICES, INC., TO EXTEND THE TERM OF THE AGREEMENT THROUGH DECEMBER 31, 2024 FOR THE RENTAL OF FENCE PANELS, STANDS AND SAFETY BRACKETS REQUIRED AT THE TEMPORARY EMERGENCY HOUSING FACILITY (TEHF)

WHEREAS, on July 5, 2023 the City Council adopted Resolution No. 2023-138 dispensing the procurement requirements for this Agreement under Tracy Municipal Code section 2.20.180, subsection (b)(4) and authorized execution of this Agreement; and

WHEREAS, the City entered into a General Services Agreement (GSA) with United Fence Services, Inc. (Consultant), to provide rental fence panels, stands & safety brackets at the Temporary Emergency Housing Facility on Arbor Avenue; and

WHEREAS, Consultant has satisfactorily met all terms of the GSA; and

WHEREAS, the City plans to extend the rental fencing around the Temporary Housing Emergency Facility to better secure the construction areas and enhance security of the residents and staff at the shelter until the permanent fences are installed as part of the Phase II construction; and

WHEREAS, Staff requests the extension of the term of the GSA through December 31, 2024; and

WHEREAS, the Tracy Homelessness Advisory Committee heard this item on October 19, 2023 and recommended that the City Council adopt the proposed Resolution; now, therefore, be it

RESOLVED: That the City Council hereby adopts a resolution approving Amendment No.1 to the General Services Agreement with United Fence Services, Inc. for the rental of fence panels, stands and safety brackets required at the Temporary Emergency Housing Facility (TEHF) to extend the agreement through December 31, 2024 and the Agreement not to exceed amount of $200,000, is unchanged.

Agenda Item 1.F

RECOMMENDATION

The Tracy Finance Committee recommends that the City Council adopt a resolution amending the City's Operating and Capital Budget for the Fiscal Year ending June 30, 2024, and authorize the Budget Officer to amend the City's position control roster for FY2023-24.

EXECUTIVE SUMMARY

The Tracy Finance Committee recommends that the City Council adopt a resolution amending the City's Operating and Capital Budget for the Fiscal Year ending June 30, 2024, and authorize the Budget Officer to amend the City's position control roster for FY2023-24.

On June 06, 2023, Council adopted the Fiscal Year (FY) 2023-24 Operating and Capital Budget. This report provides an update of the City's current financial performance, for First Quarter (Q1), through September 30, 2023. This financial summary identifies Q1 General Fund revenue and expenditure actuals and encumbrances, minor amendments to the FY 2023-24 budget, and approves the appropriations for funds that were planned in the FY 2022-23 budget but will be completed in FY 2023-24.

BACKGROUND

Quarterly, staff prepares a report to the City Council on the year-to-date revenues and expenditures as compared to the amended budget. This report provides an update and summary of the City's current financial performance, for FY 2023-24 First Quarter (Q1) through September 30, 2023, and requests that Council amend revenue and expenditures for the FY 2023-24 budget.

At the beginning of each new fiscal year items that were either underway, postponed or otherwise delayed from the prior fiscal year are re-appropriated into the current year's operating budget.

ANALYSIS

As of September 30, 2023, the General Fund expenditures are approximately 20% of the approved operating budget. General Fund revenues collected in Q1 (as of September 30, 2023), reflect approximately 11% of estimated revenues. City revenues tend to lag a quarter behind, and many revenues will appear low or zero as a result. For example, General Fund revenues in Property Tax, as well as VLF/Property Tax, are distributed in December and April and will appear in the second and fourth quarter reports. The City's Sales Tax are one-quarter in arrears and will appear after the second quarter, and first quarter collections represent advances from the State based on prior year collections, not necessarily actual collection by the State.

The chart below reviews year-to-date revenues and expenditures as compared to the amended budget as of September 30, 2023 (First Quarter-Q1). For comparison, FY 2022-23 Q1 actuals are also provided.

FY 2023-24 General Fund Budget to Actuals

REVENUES (In thousands)	FY 22/23 Q1	FY 23/24 Adopted	FY 23/24 Amended	FY 23/24 Actual Q1	% of Budget

FY 2023-24 First Quarter (Q1) Operating Budget Augmentations

The following table is a summary of all recommended Q1 budget augmentations for FY 2023-24. They are listed by department, with General and Non-General fund totals separated, and categorized as one time or on-going expenses.

Department	Description	General Fund	Other Fund	One Time	On Going
Innovation & Technology	Professional Services & Supplies		$ 55,000		$ 55,000
Police	Professional Services & Supplies	$ 180,000		$ 150,000	$ 30,000
Mobility & Housing	Professional Services	$ 36,000		$ 36,000	
Operations & Utilities	Professional Services, Supplies & Capital	$ 808,000	$5,891,100	$2,065,300	$4,633,800
	Total:	**$1,024,000**	**$5,946,100**	**$2,251,300**	**$4,718,800**

*****CONTINUED TO NEXT PAGE*****

General Fund Non-Personnel Augmentations

Department	Description	General Fund	One Time	On Going
Police	Professional Services & Supplies	$ 180,000	$ 150,000	$ 30,000
Mobility & Housing	Professional Services & Supplies	$ 36,000	$ 36,000	
Operations & Utilities	Professional Services, Supplies & Capital	$ 808,000	$ 235,000	$ 573,000
	Total:	**$1,024,000**	**$ 421,000**	**$ 603,000**

Police Department - The Police Department is requesting one-time funding for professional services for security services at various locations throughout the City, and an on-going increase professional services for software maintenance for the Special Investigation Unit.

Mobility & Housing – The Economic Development Division is requesting a one-time increase for professional Services for additional agreements.

Operations & Utilities – The Operations Division is requesting one-time funding to purchase (1) Aerial Truck to support the Electricians and on-going funding for additional asphalt and professional services for Streets and Sidewalks.

Other Funds Non-Personnel Augmentations

Department	Description	Funding Source	One Time	On Going
Innovation & Technology	Professional Services	Internal Services		$ 55,000
Operations & Utilities	Capital Replacements	Internal Services	$1,829,000	
Operations & Utilities	Professional Services	Solid Waste		$4,030,000
Operations & Utilities	Part-Time Hours	Water Operating		$ 14,000
Operations & Utilities	Part-Time Hours	Wastewater Operating		$ 40,000
		Total:	**$1,829,000**	**$4,139,000**

**Capital Replacements – Annually it is determined what vehicles and equipment are due for replacement, the departments are charged for the costs. This adjustment is providing the Operations Division the budget for the funds that they have received to purchase the replacements.*

Innovation & Technology – The Innovation & Technology Department is requesting on-going funding for professional services for additional Cyber Security systems.

Operations & Utilities - The Operations Division is requesting on-going funding for professional services related to their Solid Waste contracts to account for the contracted increase in cost of services associated to the increases in rates. The City manages the administration of the contract, which includes the collection of fees that is paid for the contracted services as a passthrough agency. This was not included in the FY23/24 budget, and this is a correction for the omission. The Utilities Division is requesting on-going funding for part-time hours to support the Lab for the treatment plants.

Non-Budgetary-Personnel Amendments:

Staff is making the following recommendations to amend FY2023-24 Position Control Roster, which are the approved positions that are included in the adopted operating budget; however, the requests do not require a budget augmentation:

(1) Construction Inspector I/II – The Operations & Utilities Department is requesting to delete (1) Associate Engineer and re-allocate funding to add (1) Construction Inspector I/II to support. This item does not require a budget augmentation.

FY 2023-24 First Quarter (Q1) Capital Improvement Project (CIP) Augmentations

Staff is making the following recommendation to add the following CIP:

NEW CIP		
CIP	**Budget**	**Fund**
77594 - Transit Station A/V Equipment Replacement	$ 200,000	573 – Transit Capital

The Tracy Transit Station was completed and opened for use in 2010. It has three conference rooms that are available for use by other City Departments as well as for rent by the public. Each room has A/V equipment that is no longer compatible with current technology standards. It is recommended that the entire system be replaced to allow for improved overall functionality and usability.

Staff is making the following recommendation to increase the budget for the following CIP:

CIP AUGMENTATION		
CIP	**Budget**	**Fund**
73186 – FY2023 Annual Pavement Rehab Project	$ 653,468	261 – Grants (RSTP)

FISCAL IMPACT

Quarterly, staff prepares a report to the City Council on the year-to-date revenues and expenditures as compared to the amended budget as of September 30, 2023 (First Quarter Q1). Staff is recommending amendments to the City Operating and Capital Budget for FY 2023-24. The FY 2023-24 proposed budget appropriations of $1.03 million General Fund and $5.9 million from other funds. In addition, the FY 2023-24 budget has been amended by $28.3 for carryover projects that were either underway, postponed, or otherwise delayed into FY 2023-24.

SUMMARY OF NEW BUDGET AUGMENTATIONS FOR (Q1) FY 2023-24

Department	Description	General Fund	Other Fund	One Time	On Going
Innovation & Technology	Contract Services & Supplies		$ 55,000		$ 55,000
Police	Contract Services & Supplies	$ 180,000		$ 150,000	$ 30,000

RESOLUTION NO. _____

ADOPT A RESOLUTION AMENDING THE CITY'S OPERATING AND CAPITAL BUDGET FOR FISCAL YEAR ENDING JUNE 30, 2024 AND AUTHORIZE THE BUDGET OFFICER TO AMEND THE CITY'S POSITION CONTROL ROSTER FOR FY2023-24

WHEREAS, The City Council, on June 6, 2023, adopted the FY 2023-24 Operating and Capital Budget for the City of Tracy, and

WHEREAS, Based upon a review of revenues and expenditures, the City Manager has prepared and proposed additional amendments to the FY 2023-24 budget, and

WHEREAS, The Innovation and Technology Department will be getting an increase to professional services for additional cyber security systems, and

WHEREAS, The Mobility and Housing Economic Division will be getting one-time funding for increased professional services, and

WHEREAS, The Police Department will be getting a one-time funding for contract services regarding security services for various locations throughout the City and an increase to professional services for software maintenance, and

WHEREAS, The Operations and Utilities Department will be getting one-time funding to purchase (1) aerial truck and increases to professional services for solid waste contracts and sidewalk maintenance, supplies for streets maintenance and personnel part-time hours to support the treatment plant lab, and

WHEREAS, The Operations and Utilities Department will be getting a one-time adjustment to provide the Operations Division the budget for purchasing the annual vehicle and equipment replacements that have been funded by the City's departments, and

WHEREAS, The Budget Officer will be deleting from the Operations and Utilities position control roster (1) Associate Engineer and re-allocate funding to add (1) Construction Inspector I/II, and

WHEREAS, Proposed amendments include re-appropriations from FY 2022-23 for items that were either underway, postponed, or otherwise delayed into FY 2023-24, and

WHEREAS, The Tracy Finance Committee heard this item on October 23, 2023 and recommends that the City Council adopt this proposed Resolution; and

WHEREAS, The City Council has considered information related to these matters, as presented at a public meeting of the City Council, including any supporting documents and reports by City staff, and any information provided during that public meeting, and

WHEREAS, The City Council has reviewed the level of budgeting control needed by the City Manager to ensure efficiency in managing the operations of the City, including the authorization of budget transfers between funds; now, therefore, be it

RESOLVED: That the City Council of the City of Tracy hereby adopts the Amended Operating and Capital Budget for Fiscal Year 2023-24 as evidenced by the attached summaries and authorize the Budget Officer to amend the City's position control roster for FY2023-24.

Agenda Item 1.G

RECOMMENDATION

Staff recommends that the City Council, by motion, appoint two students to serve on the Environmental Sustainability Commission.

EXECUTIVE SUMMARY

On January 17, 2023, City Council provided direction to staff to return with a resolution to form an Environmental Sustainability Commission (Commission). On April 18, 2023, City Council adopted Resolution 2023-068, which approved the formation and bylaws of a City of Tracy Environmental Sustainability Commission. Per the bylaws, the Commission is to consist of a total of seven (7) members - five (5) adult residents and two (2) youth residents (High school students up to and including their senior graduation year).

BACKGROUND AND LEGISLATIVE HISTORY

To fill the seats on the newly formed Environmental Sustainability Commission, the City Clerk's office opened a recruitment on May 15, 2023 and closed it on June 5, 2023. A total of three (3) applications were received.

Another recruitment was then opened on June 9, 2023 and closed on June 23, 2023. That recruitment did not include the youth recruitment due to schools being on summer break.

A recruitment for the two youth positions on the Environmental Sustainability Commission was opened on July 24, 2023 and closed on September 1, 2023. At that time a total of four (4) applications were received.

ANALYSIS

On August 2, 2023, a subcommittee consisting of Stephanie Reyna-Hiestand, Assistant Director of Utilities and Operations, Dotty Nygard, Chairperson for the Environmental Sustainability Commission and Beatrice Amezquita-Javier, Adult Representative on the Youth Advisory Commission interviewed the applicants. A total of four (4) students were interviewed for the Environmental Sustainability Commission.

The following applicants were selected to serve their term in alignment with the Youth Advisory Commission appointment term. The term begins on November 8, 2023 and end July 31, 2024; Anthony Wahhab and Leah Shoaito.

Abem Girmai and Nethra Suresh were placed on the eligibility list.

FISCAL IMPACT

None

PUBLIC OUTREACH/ INTEREST

Notification of the Environmental Sustainability Commission recruitment was posted on the City's Social Media pages, Tracy Press, the City's website, and Channel 26 and with assistance from the Parks and Recreation Department due to their recruitment experience with the Youth Advisory Committee.

STRATEGIC PLAN

This item supports Quality of Life Strategic Goal 6; Support climate initiatives to reduce Tracy's carbon footprint and preserve its natural resources and 6.A; Form an Environmental Sustainability Committee and adopt bylaws.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council, by motion, appoint two students to serve on the Environmental Sustainability Commission.

ATTEST:

CITY CLERK

COUNCIL POLICY ESTABLISHING A SELECTION PROCESS FOR APPOINTMENTS TO CITY ADVISORY BODIES

(Exhibit "A" to Resolution No. 2021-200)

SECTION 1: PURPOSE

To establish a selection process for appointments to City advisory bodies including defining residency requirements, in accordance with Government Code sections 54970 et seq.

SECTION 2: SELECTION PROCESS FOR APPOINTEE BODIES

A. On or before December 31st of each year, the City Clerk shall prepare an appointment list of all regular and ongoing boards, commissions and committees that are appointed by the City Council of the City of Tracy. The list shall contain the following information:

   1. A list of all appointee terms which will expire during the next calendar year, with the name of the incumbent appointee, the date of the appointment, the date the term expires and the necessary qualifications for the position.

   2. A list of all boards, commissions and committees whose members serve at the pleasure of the Council and the necessary qualifications of each position.

   3. The list of appointments shall be made available to the public for a reasonable fee that shall not exceed actual cost of production. The Tracy Public Library shall receive a copy of the list.

B. Whenever a vacancy occurs in any board, commission or committee, whether due to expiration of an appointee's term, resignation, death, termination or other causes, a special notice shall be posted in the office of the City Clerk, The Tracy Public Library, the City website, and in other places as directed within twenty (20) days after the vacancy occurs. Final appointment to the board, commission or committee shall not be made by the City Council for at least ten (10) working days after the posting of the notice in the Clerk's office. If Council finds an emergency exists, the Council may fill the unscheduled vacancy immediately.

C. Appointments shall be made for the remainder of the term created by the vacancy except as follows:

   1. If appointee will fill an un-expired term with six months or less remaining, the appointment shall be deemed to be for the new term.

   2. If the vacancy is filled by an emergency appointment the appointee shall serve only on an acting basis until the final appointment is made pursuant to section 2.

D. The Council shall use the following selection process to provide an equal opportunity for appointment to a board, commission or committee:

1. Council shall appoint two Council members and an alternate to serve on a subcommittee to review applications, interview applicants and recommend a candidate for appointment to the board, commission or committee.

2. If the Council subcommittee determines there are multiple qualified candidates, the subcommittee may recommend the Council establish an eligibility list that will be used to fill vacancies that occur in the following twelve (12) months.

3. At the Council subcommittee's discretion, the chair (or designee) of the board, committee or commission for which a member will be appointed, can participate in the interviews.

E. An individual already serving on a City of Tracy board, committee or commission may not be appointed to serve on an additional City of Tracy board, committee, or commission concurrently.

SECTION 3: DEFINITION OF RESIDENCY REQUIREMENTS

A. The following definitions shall be used to determine whether residency requirements are met for boards and commissions to which the Tracy City Council appoints members:

1. Tracy Planning Area means the geographical area defined in the City of Tracy General Plan and any amendments thereto.

2. City of Tracy means within the city limits of the City of Tracy.

3. Citizen means a resident of the City of Tracy.

4. Tracy School District means the geographical area served by the Tracy Unified School District.

5. Sphere of Influence shall be the geographical area approved by the Local Agency Formation Commission (LAFCo) of San Joaquin County and any amendments thereto.

B. Residency, as defined above and as set forth in the applicable bylaws for each board or commission, shall be verified annually by the City Clerk. The residency must be verifiable by any of the following means:

1. Voter registration,

2. Current California Driver's License or Identification,

3. Utility bill information (phone, water, cable, etc.),

4. Federal or State tax returns.

C. Members of boards or commissions shall notify the City Clerk in writing within thirty (30) days of any change in residency. If the change in residency results in the board member or commissioner no longer meeting the residency requirements, the member shall tender their resignation to the City Clerk who shall forward it to the City Council.

November 7, 2023

Agenda Item 1.H

RECOMMENDATION

Staff recommends that the City Council adopt a Resolution (1) awarding a construction contract to Dirt Dynasty, Inc., of Farmington, California, in the amount of $2,765,226 for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Valpico Road Intersection Project, CIP 72095, (2) approving contingency amount of $276,523 and an overall project not-to-exceed budget of $3,629,321, and (3) the Tracy Finance Committee recommends that the City Council authorize the appropriation of $2,615,202 from Master Plan Traffic Impact Fees, and $404,482 from Ellis Traffic Fees, to CIP 72095.

EXECUTIVE SUMMARY

This item is to consider the award of a construction contract with Dirt Dynasty, Inc., of Farmington, California, for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Valpico Road Intersection Project, CIP 72095 (Project) and related actions needed to complete the Project.

BACKGROUND AND LEGISLATIVE HISTORY

This Project is an approved Capital Improvement Project (CIP) and also a mitigation measure (Mitigation Measure 4.13-5a, Intersection #7) required under the Tracy Hills Specific Plan 2016 Final Subsequent Environmental Impact Report (2016 SEIR). Due to funding constraints, the Mitigation Measure is being implemented beyond the requisite deadline that was set forth in the 2016 SEIR.

The Project includes the full roadway widening and traffic signal installation at the intersection of Corral Hollow Road and Valpico Road, along with roadway paving, and installation of wet utilities, curb ramps, signage and striping. The Project will add dedicated left-turn pockets for all directions and two through lanes on Corral Hollow Road at the intersection. There will be a dedicated right-turn pocket for eastbound Valpico Road, and the Project will merge with the current roadway improvements being performed by the Tracy Lakes Development to the east, to allow for better traffic flow and improved Level of Service (LOS) at the intersection. The Project also includes the relocation of existing PG&E poles as well as other utilities such as AT&T and Comcast to accommodate the full widening of the intersection. This Project will provide the base for the future full widening of the Corral Hollow Corridor between Western Pacific Way and Linne Road, under CIP 73144.

The construction of CIP 72095 was planned to follow the completion of the widening of Corral Hollow Road under CIP 73144. The scope of the Corral Hollow Widening Project, CIP 73144, was to widen Corral Hollow Road from Western Pacific Way to Linne Road, complete with all roadway and utility improvements, except for the installation of a traffic signal at the intersection of Corral Hollow Road and Valpico Road. Since CIP 73144 was not fully funded to go into construction and there was a need to improve the Level of Service (LOS) at the Valpico intersection, the original Professional Services Agreement (PSA) with TJKM Transportation Consultants approved by the City Council (Resolution No. 2020-084) was amended on December 21, 2022, to perform additional tasks to expand the original scope to include the ultimate improvements at the intersection of Valpico Road and Corral Hollow Road, including the roadway widening and installation of wet utilities. The PSA was amended through City

Manager approval by the Urgency Ordinance No. 1285 approved by Tracy City Council on March 30, 2020. Extensive franchise relocations that were being handled under CIP 73144 were then modified to include this intersection widening as the first phase of widening improvements along the Corral Hollow Corridor between Western Pacific Way and Linne Road. The City already purchased all the necessary right-of-way for the construction of the widening of the intersection under CIP 73144.

The Project was advertised for competitive bids on August 11, 2023, and August 18, 2023.

Bids were received and publicly opened in City Hall Conference Room 203 and via teleconference at 2:00 p.m. on Tuesday, September 5, 2023, with the following results:

Contractor	**Base Bid**
Dirt Dynasty, Inc., Farmington, CA	$2,765,226
Tracy Grading and Paving, Inc., Tracy, CA	$2,776,100
GradeTech, Inc., Livermore, CA	$3,177,896
Bay Cities Paving & Grading, Inc., Concord, CA	$3,523,173

ANALYSIS

Staff's bid analysis indicated that Dirt Dynasty, Inc., of Farmington, California, is the lowest bidder.

The bidder has the appropriate contractor's license in active standing with the State of California and has completed similar projects for other public agencies.

The total estimated cost of this project, if awarded to the lowest bidder, is as follows:

Construction Bid	$ 2,765,226
Construction Management (5%)	$138,261
Design Support During Construction	$55,000
Construction Cost Contingency (10%)	$276,523
PG&E Relocation of Transmission Poles	$394,311
Total Project Cost	**$3,629,321**

Tracy Municipal Code Section 2.20.090(b) authorizes the City Manager, or their designee, to approve change orders up to the contingency amount approved by Council. City staff recommends the contingency amount for this project to be $276,523, which is 10% of the construction cost.

FISCAL IMPACT

The total estimated Project cost is $3,629,321. Under the 2016 SEIR (Mitigation Measure 4.13-5a, Intersection #7) was to be fully funded from transportation impact fees. CIP 72095 (Traffic Signal at Corral Hollow & Valpico) currently has an approved budget of $847,604 with $609,637 available. An additional appropriation is needed in the amount of $3,019,684 to complete this

Project as follows:

Funding Source	Budget	Expenses	Balance
375 - CORE Area Traffic Fees	$ 847,608	$ 237,971	$ 609,637
CURRENT BUDGET	$ 847,608	$ 237,971	$ 609,637
		Total Project Cost	$ 3,629,321
		Current Shortfall	$ (3,019,684)
Funding Source			
331 - Ellis Area Traffic Fees	$ 404,482	$ -	$ 404,482
363 - Tracy Master Plan Traffic Fees	$ 2,615,202	$ -	$ 2,615,202
REQUESTED APPROPRIATIONS	$ 3,019,684		$ 3,019,684
		Total Budget	**$ 3,629,321**

PUBLIC OUTREACH / INTEREST

This project is listed as Phase 2 of the Corral Hollow Corridor Construction Phases on the website https://www.chcorridor.com which provides the residents with an update on all the current phases of Corral Hollow Road improvements.

COORDINATION

The City's Engineering staff and consultants coordinated with several utility agencies including PG&E, Comcast, AT&T, existing Development Projects along Valpico Road, and the City's Utilities Division for this Project.

CEQA DETERMINATION

As noted above, this Project is a required Mitigation Measure under the 2016 SEIR. The Project is within the scope of the previously adopted CEQA document, and there is not any new information or modifications that warrant a Subsequent or Supplemental CEQA document pursuant to CEQA Guidelines Section 15162. No further environmental review is necessary.

STRATEGIC PLAN

This agenda item supports the City of Tracy's Quality of Life Strategic Priority, and specifically implements the following goal:

Goal 1: Advance green and roadway infrastructure projects that improve connectivity, including bike lanes.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that City Council, by resolution (1) award a construction contract to Dirt Dynasty, Inc., of Farmington, California, in the amount of $2,765,226 for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Valpico Road Intersection

Project, CIP 72095, (2) approve contingency amount of $276,523 and an overall project not-to-exceed budget of $3,629,321, and (3) the Tracy Finance Committee recommends that the City Council authorize the appropriation of $2,615,202 from Master Plan Traffic Impact Fees, and $404,482 from Ellis Traffic Fees, to CIP 72095.

TRACY CITY COUNCIL

RESOLUTION NO. 2023-_____

---

(1) AWARDING A CONSTRUCTION CONTRACT TO DIRT DYNASTY, INC., OF FARMINGTON, CALIFORNIA, IN THE AMOUNT OF $2,765,226 FOR THE TRAFFIC SIGNAL INSTALLATION AND ROADWAY WIDENING AT CORRAL HOLLOW ROAD AND VALPICO ROAD INTERSECTION PROJECT, CIP 72095, (2) APPROVING A CONTINGENCY AMOUNT OF $276,523 AND AN OVERALL PROJECT NOT-TO-EXCEED BUDGET OF $3,629,321, AND (3) AUTHORIZING THE APPROPRIATION OF $2,615,202 FROM MASTER PLAN TRAFFIC IMPACT FEES, AND $404,482 FROM ELLIS TRAFFIC FEES, TO CIP 72095.

WHEREAS, this Project is an approved Capital Improvement Project (CIP) and also a mitigation measure (Mitigation Measure 4.13-5a, Intersection #7) required under the Tracy Hills Specific Plan 2016 Final Subsequent Environmental Impact Report (2016 SEIR); and

WHEREAS, the Project includes the full roadway widening and traffic signal installation at the intersection of Corral Hollow Road and Valpico Road, along with roadway paving, and installation of wet utilities, curb ramps, signage and striping; and

WHEREAS, the Project will add dedicated left-turn pockets for all directions and two through lanes on Corral Hollow Road at the intersection; and

WHEREAS, there will be a dedicated right-turn pocket for eastbound Valpico Road, and the Project will merge with the current roadway improvements being performed by the Tracy Lakes Development to the east, to allow for better traffic flow and improved Level of Service (LOS) at the intersection; and

WHEREAS, the Project also includes the relocation of existing PG&E poles as well as other utilities such as AT&T and Comcast to accommodate the full widening of the intersection; and

WHEREAS, the Project was designed by TJKM Transportation Consultants under a Professional Services Agreement (PSA) (Resolution No. 2020-084); and

WHEREAS, the scope of Corral Hollow Widening Project, CIP 73144, was to widen Corral Hollow Road from Western Pacific Way to Linne Road, complete with all roadway and utility improvements, except for the installation of a traffic signal at the intersection of Corral Hollow Road and Valpico Road, and the scope of CIP 72095 was to design the traffic signal at Corral Hollow Road and Valpico Road intersection, along with lane transitions from the existing two-lanes to the widened Valpico Road at the intersection; and

WHEREAS, the construction of CIP 72095 was planned to follow the completion of widening of Corral Hollow Road under CIP 73144; and

WHEREAS, since CIP 73144 was not fully funded to go into construction and there was a need to improve the Level of Service (LOS) at the intersection, the PSA with TJKM was amended on December 21, 2022, to perform additional tasks to expand the original scope to include the ultimate improvements at the intersection of Valpico Road and Corral Hollow Road, including the roadway widening and installation of wet utilities; and

WHEREAS, the PSA was amended through City Manager Approval by the Urgency Ordinance No.1285 approved by Tracy City Council on March 30, 2020; and

WHEREAS, extensive franchise relocations that were being handled under CIP 73144 was then modified to include this intersection widening as the first phase of widening improvements along the Corral Hollow Corridor between Western Pacific Way and Linne Road and the City already purchased all the necessary right-of-way for the construction of the widening of the intersection under CIP 73144; and

WHEREAS, the Project was advertised for competitive bids on August 11, 2023, and August 18, 2023; and

WHEREAS, the bids were received and publicly opened in City Hall Conference Room 203 and via Teleconference at 2:00 p.m. on Tuesday, September 5, 2023; and

WHEREAS, staff's bid analysis indicated that Dirt Dynasty, Inc., of Farmington, California, is the lowest bidder; and

WHEREAS, the bidder has the appropriate contractor's license in active standing with the State of California and has completed similar projects for other public agencies; and

WHEREAS, Tracy Municipal Code Section 2.20.090(b) authorizes the City Manager to approve change orders up to the contingency amount approved by City Council; and

WHEREAS, the City seeks to have a contingency amount for this project to be $276,523; and

WHEREAS, under the 2016 SEIR, Mitigation Measure 4.13-5a, Intersection #7 was to be fully funded from transportation impact fees; and

WHEREAS, the Project already has an appropriation of Core Traffic Fees in the amount of $847,608; and

WHEREAS, the Project needs an appropriation of Master Plan Traffic Fees in the amount of $2,615,202 and Ellis Traffic Fees in the amount of $404,482; now therefore, be it

RESOLVED: That the above recitals are true and correct; and be it

FURTHER RESOLVED: That the City Council hereby awards a construction contract to Dirt Dynasty, Inc., of Farmington, California, in the amount of $2,765,226 for the Traffic Signal

Installation and Roadway Widening at Corral Hollow Road and Valpico Road Intersection Project, CIP 72095, in the form approved by the City Attorney; and be it

FURTHER RESOLVED: That the City Council approves a contingency amount of $276,523 and an overall project not-to-exceed budget of $3,629,321; and be it

FURTHER RESOLVED: That the City Council authorizes the appropriation of $2,615,202 from Master Plan Traffic Impact Fees, and $404,482 Ellis Traffic Fees, to CIP 72095, to complete the Project; and be it

FURTHER RESOLVED: That the City Council finds that the Project is a required Mitigation Measure under the 2016 SEIR; is within the scope of the previously adopted CEQA document; and that there is not any new information or modifications that warrant a Subsequent or Supplemental CEQA document pursuant to CEQA Guidelines Section 15162.

Agenda Item 1.I

RECOMMENDATION

Staff recommends that the City Council adopt a resolution: (1) accepting a second award distribution from the State of California Behavioral Health Services Justice Grant in partnership with the San Joaquin County Behavioral Health Services in the amount of $93,000; (2) Appropriating the grant award of $93,000 to the Police Department's operational budget.

EXECUTIVE SUMMARY

The Tracy Police Department working in partnership with the San Joaquin County Behavioral Health Services has awarded a second distribution of $93,000 to Tracy Police Department though the State of California's Behavioral Health Justice Intervention Services. Tracy Police Department is a sub-awardee through this grant and had previously been awarded $213,000 in 2022 for its Familiar Faces Program. After a review of the successful performance of the Tracy Police Department's program, the County awarded the second distribution. The grant funds would go towards the Tracy Police Department's Homeless Outreach Program, "Familiar Faces". The award would be used for vehicle purchase, office equipment, diversion funding and training for the program.

BACKGROUND AND LEGISLATIVE HISTORY

The Tracy Police Department's Community Services Division identified an opportunity to once again partner with the San Joaquin County Behavioral Health Services and obtain additional funding from the State of California Behavioral Health Justice Intervention Services grant. On August 16, 2022, the Tracy City Council approved to appropriate Behavioral Health Justice Intervention Services grant of $213,000. This grant was allocated to fund an ADA compliant transportation van, office equipment, training, and consultation services for a homeless outreach program staffed by a Neighborhood Resource Officer and two Homeless Outreach Coordinators, entitled, the "Familiar Faces" program. After a review of Tracy Police Department's Familiar Faces program, San Joaquin County awarded an additional $93,000 in addition to the $213,000 to the Tracy Police Department to support the Familiar Faces program.

Staff is currently formulating a grant budget and planned expenses which may include a second vehicle purchase, office equipment, diversion funding, and staff training in furtherance of the Familiar Face Program and homeless outreach. Any purchase requiring City Council approval, will be brought back to Council.

FISCAL IMPACT

The Tracy Police Department will receive $93,000 in reimbursed funding from the State of California's Behavioral Health Justice Intervention Services. The full award would be

appropriated to the Police Department's operating budget for FY 23/24. There are no matching funds required with this grant award.

STRATEGIC PLAN

This agenda items relates to the City of Tracy Council Strategic Priorities for Public Safety Goal #2 implement the adopted Homelessness Strategic plan – identify local, state, and federal funding opportunities to continue to address homeless support services.

COORDINATION

The Tracy Police Department has coordinated with San Joaquin County Behavioral Health and the City of Tracy's Department of Mobility and Housing.

RECOMMENDATION

Staff recommends that the City Council adopt a resolution: (1) accepting second award distribution from the State of California Behavioral Health Services Justice Grant in partnership with the San Joaquin County Behavioral Health Services in the amount of $93,000; (2) Appropriating the additional grant funding of $93,000 to the Police Department’s operational budget.

ADRIANNE RICHARDSON
City Clerk and Clerk of the Council of the
City of Tracy, California

November 7, 2023

Agenda Item 1.J

RECOMMENDATION

Staff recommends that the City Council adopt a resolution approving an amendment to the Lease between the City of Tracy and Giant Properties, LLC. for the Police Annex located at 1325 N. MacArthur Drive, extending the Lease for an additional 10 years with a monthly rent of $14,338.67, adjusted each year by 3%.

EXECUTIVE SUMMARY

In 2018, the City of Tracy entered into an agreement with Giant Properties, LLC (Landlord) for the lease of a building at 1325 N. MacArthur Drive for the purpose of storage and processing evidence and property (Police Annex). The term of the agreement expires on November 30, 2023. As staff desires to keep the Police Annex at the same location the City has negotiated with Giant Properties, LLC an amendment to the Lease extending the Lease for an additional 10 years. The Lease extension will remain on the same rent structure as the current Lease. Monthly rent commencing on December 1, 2023 will be 14,338.67, which is a 3% escalation from the prior year's rent. The rent will escalate at 3% annually.

BACKGROUND AND LEGISLATIVE HISTORY

As noted above, in 2018, the City of Tracy entered into an agreement with the Landlord for a five-year agreement for a 16,800 square foot industrial building situated on 1.02 +/- acres of land at 1325 N. MacArthur Drive. The Police Department has used the property to expand its storage capacity of property and evidence, add general office space, and increase space for the processing of evidence and the location is referred to as the Police Annex.

The building was needed as a result of the increased workload due to normal city growth and the generation of more cases and changes in law that require a longer retention period for property and evidence. Due to the increased demand, the Police Department identified the property at 1325 N. MacArthur Drive and found that it met its need for more storage space as well as room for expansion and additional office space. The Police Department continues to need a facility to perform the functions currently existing in the Police Annex. However, as a City building is not available nor are plans for a new building in the foreseeable future, staff recommends that the City Council approve the proposed extension.

Specifically, staff has negotiated a Lease extension for a term of 10 years and a monthly rent cost of $14,338.67 ($172,068 annual cost). This agreement will include an annual 3.0% rent increase, which is lower than the current inflation rate.

ANALYSIS

The City of Tracy City Attorney's Office directly negotiated this agreement with Giant Properties, LLC. Importantly, the City has expended considerable funds over the Lease

term to repair roof issues and the building lacks heating and air conditioning (HVAC) in a small office area. In consideration of a 10-year extension, the Landlord has agreed, at its cost, to replace the roof and to install HVAC in the office area. The estimated cost of these improvements is approximately $125,000. The Landlord also has agreed to pay for any repair or replacement costs related to the HVAC and the roof throughout the 10-year extension period, except for routine service and maintenance costs related to the HVAC. Additional terms of lease agreement will remain the same as originally negotiated.

FISCAL IMPACT

The 10-year agreement will cost $1,720,680 ($14,338.67 monthly). The 3.0% annual increase is not reflected in total cost figure. The amended lease agreement with Giant Properties, LLC will result in an increase in cost of $12,450 in the current fiscal year. Funding is provided through the Police Department's adopted operating budget in the General Fund.

PUBLIC OUTREACH/ INTEREST

This is an operational item for the Police Department. No public outreach was conducted.

COORDINATION

This is an operational item for the Police Department. No coordination is needed with any other City department.

CEQA DETERMINATION

This action is exempt from the California Environmental Quality Act pursuant to Section 15301 (Existing Facilities) of the California Code of Regulations.

STRATEGIC PLAN

This agenda item is a routine operational item and does not relate to Council strategic plans.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council adopt a resolution approving an amendment to the Lease between the City of Tracy and Giant Properties, LLC. for the Police Annex located at 1325 N. MacArthur Drive, extending the Lease for an additional 10 years with a monthly rent of $14,338.67, adjusted each year by 3%.

ATTACHMENT A

Second AMENDMENT TO LEASE

THIS AMENDMENT TO LEASE is made and entered into as of October 30, 2023, by and between Giant Properties, LLC ("Lessor") and City of Tracy Police Department ("Lessee").

WHEREAS, on or about August 6, 2018 a Lease was entered into by and between Lessor and Lessee relating to certain real property commonly known as (street address, city, state, zip): 1325 N MacArthur Drive, Tracy, CA 95376 (the "Premises"), and

WHEREAS, Lessor and Lessee ☑ have ☐ have not previously amended said Lease, and

WHEREAS, the Lessor and Lessee now desire to amend said Lease,

NOW, THEREFORE, for payment of TEN DOLLARS and other good and valuable consideration to Lessor, the receipt and sufficiency of which is hereby acknowledged, the parties mutually agree to make the following additions and modifications to the Lease:

☑ TERM: The Expiration Date is hereby ☐ advanced ☑ extended to November 30, 2033.

☐ AGREED USE: The Agreed Use is hereby modified to: _____.

☑ BASE RENT ADJUSTMENT: Monthly Base Rent shall be as follows: $14,338.67 per month Year 1, increasing by three percent (3%) each year thereafter.

☑ OTHER: Lessor, at Lessor's sole cost and expense, shall install a new roof and one (1) new three (3) ton HVAC unit. Lessor shall engage said work within sixty (60) days of commencement with work commencing as soon as possible, subject to materials availability, contractor's schedule and weather. Lessor shall have the obligation to repair and or replace the new roof or HVAC unit during the amended ten (10) year lease term, excepting that Lessee shall remain responsible for service contracts and routine maintenance of the HVAC unit pursuant to the original Lease.

This Amendment shall not be construed against the party preparing it, but shall be construed as if all parties jointly prepared this Amendment and any uncertainty and ambiguity shall not be interpreted against any one party. Signatures to this Amendment accomplished by means of electronic signature or similar technology shall be legal and binding.

All other terms and conditions of this Lease shall remain unchanged and shall continue in full force and effect except as specifically amended herein.

EXECUTED as of the day and year first above written.

ADRIANNE RICHARDSON
City Clerk and Clerk of the Council of the
City of Tracy, California

November 7, 2023

Agenda Item 1.K

RECOMMENDATION

Staff recommends that the City Council adopt a Resolution authorizing an increase in the Not-to-Exceed Amount for Labor Relations Negotiations and Consulting Services with Liebert Cassidy Whitmore, by $125,000 for a total Not-to-Exceed Amount of $225,000.

EXECUTIVE SUMMARY

After a competitive solicitation process, the City of Tracy contracted with Liebert Cassidy Whitmore (LCW) to serve as its Labor Negotiator for employee bargaining agreements that were expiring in the Summer of 2023. The contracted scope also allowed LCW to provide related consulting services. The original contract amount was capped at $100,000, and the contract was executed pursuant to the urgency authority that had previously been granted to the City Manager. Staff recommends that the City Council authorize an increase to this previous contract amount by $125,000, bringing the total amount to $225,000.

BACKGROUND AND LEGISLATIVE HISTORY

LCW is a law firm and provides legal services to the City on various matters. In addition to legal services, LCW also provides labor negotiations and consulting services on administrative employment issues to public agencies throughout the State of California. The City has engaged with LCW through a legal services fee agreement, dated April 2023. This fee service agreement was created by the City Attorney and is templated from the California State Bar's Sample Fee Agreement Forms. In the past year, all outside counsel have been asked to execute this new Fee Agreement, which is modeled as a "master services agreement" so that the nature of the relationship between the City Attorney's Office and the outside counsel is outlined in the base agreement and work is procured through a scope of services. Each scope identifies the nature of each discrete matter for which legal services are being procured and a related budget.

While within the overall legal services fee agreement between the City and LCW, the specific scope that is the subject of this agenda item actually relates to professional services for labor negotiations and consulting services (A-1 to the fee agreement) and not for legal services. As such, the City Manager's contract authority was utilized to enter into this specific scope, and the contracted budget was capped at $100,000, pursuant to the urgency authority that had previously been granted to the City Manager. LCW will continue to assist Human Resources staff with bargaining conversion of the retiree medical program. Due to an unanticipated increase in the cost of delivering the labor negotiations and the need for future services, additional funding of $125,000 is necessary. As the contracted budget for this specific scope has exceeded the City Manager's previous authority, staff is requesting the Council to authorize an increase in the contracted budget and, if approved, the requisite contract amendment will be executed by the City Attorney pursuant to her already delegated authority under the Tracy Municipal Code to contract legal services.

FISCAL IMPACT

Funding for the increase to the contract with Liebert Cassidy Whitmore is included in the

adopted FY 2023-24 Human Resources Department budget and no additional appropriation is needed.

STRATEGIC PLAN

This agenda item supports the City's Governance Strategy and Business Plan, and specifically implements the following goals and objectives:

Governance Strategy

To enhance fiscal stability, retain and attract new talent, improve the use of technology, and enhance engagement and transparency for the betterment of the Tracy community.

Goal 3: Ensure continued fiscal sustainability through financial and budgetary stewardship.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council adopt a Resolution: authorizing an increase in the Not-to-Exceed Amount for Labor Relations Negotiations and Consulting Services with Liebert Cassidy Whitmore, by $125,000, for a total Not-to-Exceed Amount of $225,000.

TRACY CITY COUNCIL

RESOLUTION NO. _____

AUTHORIZING AN INCREASE IN THE NOT-TO-EXCEED AMOUNT FOR LABOR NEGOTIATIONS AND CONSULTING SERVICES WITH LIEBERT CASSIDY WHITMORE, BY $125,000 FOR A TOTAL NOT-TO-EXCEED AMOUNT OF $225,000

WHEREAS, Liebert Cassidy Whitmore (LCW) is a law firm and provides legal services to the City on various matters through a fee agreement; and

WHEREAS, In addition to legal services, LCW also provides labor negotiations and consulting services on administrative employment issues to public agencies throughout the State of California; and

WHEREAS, After a competitive solicitation process, the City of Tracy contracted with LCW for labor negotiations for employee bargaining agreements that were expiring in the Summer of 2023 and consulting services; and

WHEREAS, As the contracted scope was specifically for non-legal professional services, the City Manager's contract authority was utilized and the contracted scope was capped at $100,000, pursuant to the urgency authority that had previously been granted to the City Manager; and

WHEREAS, Additional contract authority, in the amount of $125,000, is necessary to pay for services rendered for labor negotiations and consulting services to assist with conversion of the retiree health program; and

WHEREAS, The total not-to-exceed for the scope will now be $225,000; and now therefore be it

RESOLVED: That the City Council of the City of Tracy hereby authorizes an increase in the not-to-exceed amount for labor negotiations and consulting services with Liebert Cassidy Whitmore, by $125,000, for a total not-to-exceed amount of $225,000; and be it further

RESOLVED: That the City Attorney shall execute the appropriate amendment to the existing fee agreement with LCW to reflect the increased authorization granted herein for the labor negotiations and consulting services scope.

Agenda Item 3.A

RECOMMENDATION

Staff recommends that the City Council conduct a public hearing and, upon conclusion, adopt a Resolution: 1) adopting the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program, in accordance with the California Environmental Quality Act, for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection Project, Capital Improvement Project 72104, and 2) authorizing the City Manager to execute and file the Notice of Determination.

EXECUTIVE SUMMARY

This request is for the City Council to conduct a public hearing to review and consider a Mitigated Negative Declaration (MND) for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection Project, Capital Improvement Project (CIP) 72104, and upon conclusion of the public hearing, adopt a resolution adopting the MND.

BACKGROUND AND LEGISLATIVE HISTORY

The Traffic Signal Installation and Roadway Widening at Corral Hollow Road and West Linne Road Intersection (Project) is an approved CIP. On April 6, 2021, Resolution No. 2021-040 was adopted by the City Council, approving a Professional Services Agreement (PSA) for Mark Thomas and Company, Inc., for the project management, preparation of plans, specifications, and estimate (PS&E), environmental document preparation, railroad and utility coordination, and preparation of plats and legal description for right-of-way acquisition and community involvement, for CIP 72104.

This Project includes the widening of Corral Hollow Road from just north of the Union Pacific Railroad (UPRR) right-of-way at West Linne Road to approximately 500 feet south of West Linne Road per the City approved Interim Geometry Exhibit prepared by Kimley Horn & Associates, Inc. The improvements include the construction of new travel lanes, a traffic signal at the intersection, a pre-signal for southbound traffic on Corral Hollow Road before the UPRR railroad tracks, improvements to the UPRR gate crossing, installation of streetlights, median, curbs, sidewalks, drainage basin, and coordination/relocation of affected existing franchise utilities.

This Project is an integral part of the overall Corral Hollow Road Corridor Widening Project from Parkside Road to I-580. The widening of Corral Hollow Road Corridor is partially located within the jurisdiction of San Joaquin County that fronts various residential developments. Staff conducted multiple meetings with property owners, San Joaquin County staff, and elected officials to develop the agreement to establish the City of Tracy as the lead agency in the acquisition of rights-of-way, design, and construction of improvements. An agreement between the City of Tracy and San Joaquin County was executed on February 8, 2016, authorizing the City to be the lead agency for design and construction of the corridor improvements, including this CIP 72104.

The Project is currently at 90 percent design with ongoing coordination with UPRR and several utility companies. The Project will soon be entering the right-of-way phase of the Project, during

which the City will proceed with property acquisitions for the necessary right-of-way.

ANALYSIS

The City is the lead agency for California Environmental Quality Act (CEQA) review of the Project. In November 2022, the environmental sub-consultant for the Project, Kimley-Horn & Associates, Inc. prepared an Initial Study/Mitigated Negative Declaration (IS/MND) for the Project (see Attachment A). The Draft IS/MND was posted on the City's website from November 14, 2022 to December 15, 2022, for comments in accordance with CEQA requirements. Furthermore, the notice was published in Tracy Press on November 14, 2022 and sent to interested agencies and fronting residents for their review and comment. The Notice of Completion (see Attachment B) was submitted to the State Clearinghouse for the MND to begin the requisite review process. The IS/MND determined that the proposed Project will not have significant impacts on the environment, with the inclusion of appropriate avoidance, minimization and mitigation measures included in the Mitigation Monitoring and Reporting Program shown as Attachment C (MMRP).

Written comments were received from two public agencies. These comment letters are attached as exhibits in the MND. Mitigation of the environmental effects was already included in the MND and MMRP, and staff determined, in consultation with its technical consultants, that no changes to the MND and MMRP were required as a result of these letters. CEQA requires that the lead agency, in this case the City, consider the proposed MND together with any comments received during the public review process.

Staff recommends that the City Council adopt a Mitigated Negative Declaration and the related MMRP as the appropriate environmental document. CEQA Section 15074 also requires adoption of an MMRP when an agency adopts an MND to mitigate or avoid significant environmental impacts. Subject to approval by the City Council, staff requests authorization to file the Notice of Determination (see Attachment D) with the County Clerk, which will complete the environmental document process for CIP 72104, in compliance with CEQA.

FISCAL IMPACT

Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection Project, CIP 72104, is an approved Capital Improvement Project with a total Project budget of $925,000. The cost for preparation of the environmental documents was included in the PSA for the design services with Mark Thomas & Company.

PUBLIC OUTREACH / INTEREST

The IS/MND went through a thorough public outreach as explained in the Analysis portion of this staff report.

COORDINATION

The City's Engineering Division coordinated with several stakeholders including California Department of Transportation (Caltrans), San Joaquin County, San Joaquin Council of Governments (SJCOG), UPRR, public and private utility companies for the various phases of this Project.

STRATEGIC PLAN

This agenda item supports the City of Tracy's Quality of Life Strategic Priority, which is to provide an outstanding quality of life by enhancing the City's amenities, business mix and services, and cultivating connections to promote positive change and progress in our community and specifically implements the following goal:

Goal 1: Advance green and infrastructure projects that improve connectivity including bike lanes.

ACTION REQUESTED OF THE CITY COUNCIL

Staff recommends that the City Council conduct a public hearing and, upon conclusion, adopt a Resolution: 1) adopting the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program, in accordance with the California Environmental Quality Act, for the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection Project, Capital Improvement Project 72104, and 2) authorizing the City Manager to execute and file the Notice of Determination.

1.0 INTRODUCTION & PURPOSE

1.1 PURPOSE AND SCOPE OF THE INITIAL STUDY

This IS/MND has been prepared in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code [PRC] Section (§) 21000 et seq.) and its Guidelines (California Code of Regulations [CCR], Title 14, §15000 et seq.), to evaluate the potential environmental effects associated with the construction and operation of the Corral Hollow and Linne Road Improvements Project (proposed project). Pursuant to Section 15367 of the State CEQA Guidelines, the City of Tracy (City) is the lead agency for the proposed project. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

As set forth in the State CEQA Guidelines Section 15070, an IS/MND can be prepared when the Initial Study has identified potentially significant environmental impacts, but revisions have been made to a project, prior to public review of the Initial Study, that would avoid or mitigate the impacts to a level considered less than significant; and there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment.

1.2 SUMMARY OF FINDINGS

Section 3.0 of this document contains the Environmental Checklist that was prepared for the proposed project pursuant to CEQA requirements. The Environmental Checklist indicates whether the proposed project would result in no impact, less than significant impacts, less than significant impacts with the implementation of mitigation measures, or potentially significant impacts. These impacts are identified and discussed within each subsequent resource area throughout this document.

MITIGATION MEASURES

State CEQA Guidelines Section 15041, *Authority to Mitigate,* gives the lead agency for a project the authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements such as the "nexus" and "rough proportionality" standards. CEQA Guidelines Section 15364 defines "feasible" as capable of being accomplished in a successful manner within a reasonable period of time, considering economic, environmental, legal, social, and technological factors. Mitigation measures will be adopted, as needed and feasible, to reduce the environmental impacts to less than significant levels and must be consistent with all applicable constitutional requirements, including the following:

- There must be an essential nexus (i.e., connections) between the mitigation measure and legitimate governmental interest.
- The mitigation measure must be "roughly proportional" to the impacts of the project.

Several forms of mitigation under CEQA Section 15370 are summarized as follow:

- **Avoiding** the impact by not taking a certain action(s);
- **Minimizing** impacts by limiting the degree or magnitude of the action and its implementation;
- **Rectifying** the impact by repairing, rehabilitating, or restoring the impacted environment;

- **Reducing or eliminating** the impact over time by preservation and maintenance operations during the life of the action; and
- **Compensating** for the impact by replacing or providing substitute resources or environment.

Avoiding impacts is the preferred form of mitigation, followed by minimizing or rectifying the impact to less than significant. Compensating for impacts would be pursued if no other form of mitigation is feasible.

ENVIRONMENTAL RESOURCE TOPICS

This IS/MND evaluates the proposed project's impacts on the following resource topic:

- Aesthetics
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazard and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Tribal/Cultural Resources
- Transportation
- Utilities and Service Systems
- Wildfire

1.3 REPORT ORGANIZATION

This document has been organized into the following sections:

Section 1.0 – Introduction. This section provides an introduction and overview describing the conclusions of the Initial Study.

Section 2.0 – Project Description. This section identifies key project characteristics and includes a list of anticipated discretionary actions.

Section 3.0 – Initial Study Checklist. The Environmental Checklist Form provides an overview of the potential impacts that may or may not result from project implementation.

Section 4.0 – Environmental Evaluation. This section contains an analysis of environmental impacts identified in the environmental checklist.

Section 5.0 – References. The section identifies resources used to prepare the Initial Study.

2.0 DESCRIPTION OF PROPOSED PROJECT

2.1 PROJECT LOCATION

The proposed project is located within in the City of Tracy in San Joaquin County, California. The project site is located at the intersection of Corral Hollow Road and Linne Road. The project site is located approximately 1.5 miles north of the Interstate 5/Corral Hollow Road freeway interchange and approximately 0.75-mile north of the Tracy Municipal Airport. The project also would result in acquisitions of portions of seven existing parcels, and would be adjacent to one parcel, and make a minor upgrade to immediately adjacent area. Please see **Figure 2-1: Regional Map** and **Figure 2-2: USGS Topographic Map**, that show the project location. The APN's and addresses that would be affected, the acreage of those parcels, right-of-way acquired, existing land uses, and description of the acquired property are shown in *Table 2-1: Project Parcels and Acquisition Areas*.

Table 2-1: Project Parcels and Acquisition Areas

APN and Address	Acres	ROW Acquired	Existing Land Uses	Description of Acquired Property
025-311-029 11888 W. Linne Road	22.99	0.0 acres	Heavy Industrial	None. Adjacent to the southerly boundary of the parcel.
025-311-020 28720 South Corral Hollow Road	1.9	0.53 acres	Rural Residential – 2 or more residential	Disturbed/mowed undeveloped land, billboard, fencing, gravel/dirt driveway and parking lot
024-401-008 None	1.31	0.24 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder
024-401-007 None	1.31	0.04 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder/Easement for railroad line
024-014-033 28499 South Corral Hollow Road	14.49	0.12 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder/Easement for railroad line
025-302-012 28677 South Corral Hollow Road	119.55	01.60 acres	Irrigated Orchard	Interior dirt road in orchard adjacent to Corral Hollow Road. Approximately 24-26 orchard trees.
024-014-021 24855 South Corral Hollow Road	1.95	0.1 acres	Small industrial utility building with gated dirt driveway	No Acquisition – Make improvement to existing driveway.
025-311-002 28818 South Corral Hollow Road	1.49	0.1 acres	Heavy Industrial	No Acquisition – Make improvement to existing driveway.

2.2 ENVIRONMENTAL SETTING

REGIONAL SETTING

Regionally, the City of Tracy in central California and approximately 53 miles directly east of San Francisco and 19 miles southwest of Stockton. The City of Tracy is in an area of California called the Central Valley. The Central Valley is an elongated valley occupying the central region of California and is on average 50 miles wide and approximately 400 miles in length from the City of Redding on the north to approximately 30 miles south of the City of Bakersfield on the south (USGS, 2021). As one of the most notable structural depressions in the world, the Central Valley is known for its prolific agricultural production. Hydrologically, the project site is within the San Joaquin Basin, which is characterized by the San Joaquin River which flows northwesterly from the Sierra Mountains to the southeast and through the basin with outlets to the San Francisco Bay and ultimately the Pacific Ocean. The City of Tracy is located approximately four miles west of the nearest reaches of the river and approximately 10 miles from the western boundary of the basin at Coast Range approximately 10 miles to the west.

LOCAL SETTING

The land uses within the project area are consists of a mix of agriculture, industrial, residential, and infrastructure (canals and airport). Residential uses are dominant to the north as new development is expanding southerly from the main City center. Residential development is located to the northwest of the project site and additional homes are under construction. Further to the northwest the primary land uses are agricultural production. To the southeast, south, and southwest, the project is surrounded by a mix of land uses. This includes industrial uses for concrete production, the Tracy Municipal Airport, American Legion Park, the Tracy Water Treatment Plan, the northerly reach of the Delta Mendota Canal, and agricultural land.

Adjacent land uses to the north of Linne Road include highly disturbed roadway shoulder and the Union Pacific Railroad (UPRR). This area is nearly devoid of vegetation and does not contain any structures. To the south of Linne Road is an industrial site with numerous buildings used for sand and gravel operations and manufacturing concrete products. To the southeast of the corner of Linne Road and Corral Hollow Road is a lot that is partially developed with three small single-story structures. The westerly side of this lot is adjacent to the eastern alignment of Corral Hollow Road. The northerly portion of the lot contains a undeveloped but disturbed area with an existing billboard. The southerly half of this parcel contains three structures. To the west of Corral Hollow Road is agricultural land that is cultivated with an orchard. There are above ground power lines strung on wooden power poles along both the southerly sides of Linne Road and the easterly side of Corral Hollow Road.

Figure 2-3: Aerial Map, shows the project intersection and roadways on an aerial, and **Figure 2-4: Project Acquisition Areas**, show project site and portions of adjacent parcels that would be acquired, or have improvements made, as well as areas needed for temporary construction easements. The City of Tracy General Plan and zoning designations for the project parcels are shown in *Table 2-2: Project Parcels General Plan and Zoning*. Adjacent to the north and northwest of the Corral Hollow Road intersection land use designation is for Commercial (C), to the southwest is Urban Reserve, and to the southeast Industrial.

Table 2-2: Project Parcels General Plan and Zoning

APN and Address	General Plan	County Zoning
025-311-029 **11888 W. Linne Road**	Heavy Industrial	I/L
025-311-020 **28720 South Corral Hollow Road**	Heavy Industrial	I/L
024-401-008 **None**	Existing Linne Road alignment and ROW	Rail Road/UPRR ROW
024-401-007 **None**	Existing Linne Road alignment and ROW	Rail Road/UPRR ROW
024-014-033 **28499 South Corral Hollow Road**	None	AU-20
025-302-012 **28677 South Corral Hollow Road**	Urban Reserve	AU-20
024-014-021 **24855 South Corral Hollow Road**	Commercial	AU-20
025-311-002 **28818 South Corral Hollow Road**	Heavy Industrial	I/L AU-20 Rail Road/UPRR ROW

PROJECT APPROVALS

The proposed project would require the following approvals:

- Improvement Plans

2.3 PROPOSED PROJECT

The proposed project would make transportation improvements within Corral Hollow Road, Linne Road, within the intersection of the two roadways and within portions of adjacent parcels as shown in *Table 1*, above. Improvements would include widening Corral Hollow Road, Linne Road, and the addition of signals within the intersection. The intersection of Corral Hollow Road currently operates at a deficient LOS. The improvements, widening, addition of dedicated turn land and addition of signalization and improvements would improve the LOS. Intersection improvements would improve mobility, alleviate traffic congestion, and improve traffic efficiency along Corral Hollow Road.

Corral Hollow Road would be widened to two (2) travel lanes in each direction. These project improvements would start immediately north of the Union Pacific Railroad (UPRR) right of way ROW and extend southerly to approximately 500 feet south of the intersection with W. Linne Road. Other improvements proposed along Corral Hollow Road would include the construction of a center median, curbs, and sidewalks. New sidewalk and curb and gutter would be installed on the westerly side of the

roadway and at the two corners of the intersections. Standard sidewalks and curb ramps would be Americans with Disabilities (ADA) compliant. In addition, the driveways to the adjacent properties would be improved with new concrete driveways (a total of four new driveways would be installed. One each at APNs (024-014-041), (25-311—020), and two for APN (025-311-002).

A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Other standard improvements would include the installation of new signage, roadway striping, and crosswalks. All roadway improvements would conform to Caltrans and City standards as applicable.

Minor improvements to Linne Road would be made, primarily in the westbound lanes. The road would be widened to enable paving and striping of a new right turn only lane. The existing left lane would remain and be used as a left only to southbound Corral Hollow Road. New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road as well as streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road by the proposed project. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal, the pre-signal, and raising and lowering of guard arms, would be created in coordination with UPRR. All work within the UPRR right of way will be constructed by UPRR labor forces.

As discussed above, some right of way (ROW) acquisitions would be required. In addition to the listed 40 orchard trees above, approximately 151 other trees would be removed, for new right-of-way and a temporary construction easement. In addition, the project would require removals of some existing hardscape, existing fencing, and grinding and matching with existing pavement grades, and utility relocation.

It should be noted that Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). **Figure 2-5: Project Improvement Plans**, provides a graphic representation and location of the proposed improvements.

Stormwater

The proposed project would include new stormwater facilities and would utilize an approximate 0.35-acre retention basin to contain stormwater flows, promote water infiltration, and reduce potential for increased downstream stormwater flows.

Utilities

The proposed project, as needed, would tie into existing utilities for electrification of the new signals, streetlights, and other roadway and railroad crossings. The project does not propose any tie in to existing water, sewer, or gas facilities because the project does not include new land uses. The proposed project would realign the above ground utility lines and poles adjacent to the new roadways.

Construction

Some demolition, excavation, and grading would be required for this project. Equipment that may be used to accomplish project work is listed below. Some excavation to a maximum depth of 14 feet for the installation of traffic signal poles, six feet for the drainage feature, and four feet for road widening would be required only where these project elements are proposed.

Bobcat/skid steer loader	Gradall (multi-purpose excavator
Compactor (Ground)	Jackhammer
Concrete Mixer Truck	Pavement Scarifier/Roller
Concrete Saw	Pneumatic Tools
Crane or bucket truck	Truck (Dump/Flat Bed
Dozer/Grader/Excavator/Scraper

3.0 INITIAL STUDY CHECKLIST

NOTE: The following is a sample form that may be tailored to satisfy individual agencies' needs and project circumstances. It may be used to meet the requirements for an initial study when the criteria set forth in CEQA Guidelines have been met. Substantial evidence of potential impacts that are not listed on this form must also be considered. The sample questions in this form are intended to encourage thoughtful assessment of impacts, and do not necessarily represent thresholds of significance.

1. **Project title:**

   The Corral Hollow and Linne Road Improvements Project

2. **Lead agency name and address:**

   City of Tracy
   333 Civic Center Plaza
   Tracy, CA 95376

3. **Contact person and phone number:**

   Anju Pillai, PE., MS Engr.
   Senior Civil Engineer
   (209) 831 6455

4. **Project location:**

   11888 W. Linne Road, 28720 South Corral Hollow Road, APN 024-401-008 and 024-401-007 (no address), 28499 South Corral Hollow Road, 28677 South Corral Hollow Road, 24855 South Corral Hollow Road.

5. **Project sponsor's name and address:**

   City of Tracy
   333 Civic Center Plaza
   Tracy, CA 95376

6. **General plan designation:**

   Commercial (C), Industrial (I), and Urban Reserve 10[1]. The project area has been planned for in the City General Plan and includes these designations.

7. **Zoning:**

   Limited Industrial (I/L); (Industrial) Agriculture-Urban Reserve (AU-20); Railroad/UPRR ROW. The proposed project is within unincorporated San Joaquin County and includes these zones.

[1] Urban Reserve 10 – is a 120-acre parcel and is a portion of the previously approved South Schulte Specific Plan area. The vision for the area is for industrial development to capitalize on the area's proximity to I-580 and the Union Pacific Railroad line. See page 110/402 of General Plan.

8. Description of project: (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary.)

The proposed project would widen Corral Hollow Road to two (2) travel lanes in each direction starting immediately north of the Union Pacific Railroad (UPRR) right of way (ROW) at W. Linne Road to approximately 500 feet south of the intersection with W. Linne Road. Improvements proposed by the project along Corral Hollow Road in addition to the widening would include the construction of a median, curbs, and sidewalks, the construction of a drainage feature on the west side of the project site, and the installation of new signage and striping. Some ROW acquisition, temporary construction easements, and utility relocation would be required for project implementation. Linne Road would be widened to enable restriping for a single right-turn lane only and left turn only lane for westbound traffic.

New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road, streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal and the pre-signal would be created in coordination with UPRR.

9. Surrounding land uses and setting: Briefly describe the project's surroundings:

The area surrounding the project is designated for commercial, industrial, and urban reserve. Existing surrounding uses include industrial (sand and gravel, concrete operations), agricultural (orchard), residential uses (low density residential (LDR) further to the northwest and northeast and UPRR railroad adjacent to Linne Road and that crosses Corral Hollow Road. The project is located near the westerly City limits and would primarily occur within existing roadways (Corral Hollow Road and Linne Road).

10. Public agencies whose approval is required (e.g., permits, financing approval, or participation agreement.)

City of Tracy

- Adoption of the Mitigated Negative Declaration (MND);
- Adoption of the Mitigation Monitoring and Reporting Plan (MMRP), and
- City review and approval of Grading and Improvement Plans.

Other Agencies which may be required to issue a permit or approval.

- Department of Water Resources (DWR);
- Regional Water Quality Control Board - National Pollution Discharge Elimination System (NPDES), and Stormwater Pollution Prevention Plan (SWPPP);
- San Joaquin Valley Air Pollution Control District;
- San Joaquin Council of Governments (SJCOG);
- California Department Fish and Wildlife (CDFW); and
- California Department of Toxic Substances Control (DTSC);

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

On August 1, 2022 the City of Rio Tracy, acting as the CEQA Lead Agency informed eight tribes including the (Ione Band of Miwok Indians, The Confederated Villages of Lisjan, Muwekma Ohlone Indian Tribe of the SF Bay Area, North Valley Yokuts Tribe, Tule River Indian Tribe, Buena Vista Rancheria of Me-Wuk Indians, Wilton Rancheria, and Wuksache Indian Tribe/Eshom Valley Band of the proposed project and invited to consult. No requests for consultation were received.

NOTE: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

3.1 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Unless Mitigation Incorporated" as indicated by the checklist on the following pages. No environmental factors were identified as "Potentially Significant Impact."

- ☐ Aesthetics
- ☒ Agricultural and Forestry Resources
- ☐ Air Quality
- ☒ Biological Resources
- ☒ Cultural Resources
- ☐ Energy
- ☒ Geology/Soils
- ☐ Greenhouse Gas Emissions
- ☒ Hazards & Hazardous Materials
- ☒ Hydrology/Water Quality
- ☐ Land Use/Planning
- ☐ Mineral Resources
- ☐ Noise
- ☐ Population/Housing
- ☐ Public Services
- ☐ Recreation
- ☐ Transportation
- ☒ Tribal Cultural Resources
- ☐ Utilities/Service Systems
- ☐ Wildfire
- ☐ Mandatory Findings of Significance

DETERMINATION:

On the basis of this initial evaluation (check one):

☐ The proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ Although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ The proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ The proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ Although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

4.0 ENVIRONMENTAL ANALYSIS

AESTHETICS

ENVIRONMENTAL IMPACTS Issues		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
1.	**AESTHETICS. Except as provided in Public Resources Code Section 21099, would the project:**				
a)	Have a substantial adverse effect on a scenic vista?			**X**	
b)	Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?			**X**	
c)	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?			**X**	
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?			**X**	

a) Have a substantial adverse effect on a scenic vista?, and c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The City of Tracy General plan does not specifically designate any scenic viewsheds within the City. The existing Tracy General Plan Draft EIR does, however, note Tracy's scenic environmental resources include the views to the surrounding natural hillsides in the western portion of the City, as well as views of agricultural land from highways and other roadways (City of Tracy, 2005).

Under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the public. A vista is a view from a particular location or combination of locations; a scenic vista combines an aesthetically pleasing aspect, often natural, to the vista. Examples of scenic vistas can include mountain ranges, valleys, ridgelines, water bodies, or visually important trees, rock outcroppings, or historic buildings. While a scenic vista may be formally designated, they can be informal public views. Changes in the viewshed are

typically discussed in terms of foreground, middleground, and background views. An adverse effect to a scenic vista may result from a degradation of an existing vista or the loss of access to an existing viewpoint.

Impacts to scenic resources occur when changes to a site have an effect on these resources directly or impact the availability of views to such resources. The proposed project is located within Corral Hollow and Linne Road at a stop-controlled intersection in an area characterized by industrial, agricultural, residential, railroad, and utilities (e.g., overhead powerlines). Proposed improvements would widen the roadways, signalize the intersection, install streetlights, make pedestrian improvements, and tie into existing portions of Corral Hollow Road to the north and south that have already been widened.

The project would introduce new visual elements to the project site but the changes to the visual environment would not be considered a substantial alternation. The proposed project would not significantly impact any scenic vista. The new signal poles, mast arms, and street lighting would be above ground level and extend upward from ground level and be visible in the skyline from closer viewing angles. These elements, however, would not be dissimilar to the existing power poles, power lines, streetlights, and billboard, and railroad crossing arms. The proposed project would relocate the powerlines on adjacent to the existing Corral Hollow Land alignment and would remove the billboard which would decrease the visual obstructions in the skyline.

The proposed project does not include any other elements that would be elevated and have the potential to affect any distant views or a the local viewshed. The proposed project would be consistent with the existing visual environment and is an extension of existing uses. Thus, the proposed project would not result in a substantial alteration to the existing visual character of the site or its surroundings. The proposed project would not substantially alter the existing character of the area. Impacts would be less than significant, and no mitigation is required.

b) Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?

Less than Significant Impact. The project site is not located within view of a scenic highway. There are two officially designated scenic highway segments in the City including portions of Interstate 580 (I-580) between I-205 and I-5, and I-5 between I-205 and the Stanislaus County border. The proposed project may be intermittently viewed between highway berm from I-580, which is approximately 1.5 miles to the south and west. interment views, however, would be available at highway travel speeds and would largely be obscured by intervening development, manufactured slopes along the freeway, and intervening vegetation. The project site is not visible from the segment of I-5 between I-205 and the Stanislaus County border.

Thus, **a**lthough the project site may be intermittently visible from I-580 for short periods of time, there are no trees, rock outcroppings, or historical buildings on the project site that would alter the viewshed from the perspective of viewers from the freeway. Therefore, the proposed project would not substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway. Implementation of the proposed project would have a less than significant impact in this regard and mitigation is not required.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. See Impact discussion under a), above.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. There is a potential for the implementation of the proposed project to introduce new sources of light and glare into the project area during construction and operation. Contributions to light and glare impacts would include temporary during construction, short-term and only occurring this period of time. The project does include new streetlights and signals that would introduce a new light source in the area for the life of the project. The proposed project would conform to City of Tracy standards for street lighting that establish requirements for light illumination, the use of LED lighting, the use of light shields, and lighting that is directed downward to minimize the effects of spill light, the halo effect, and potential for glare. Thus, the proposed project would have a less than significant impact in this regard and mitigation is not required.

Cumulative Impacts

The potential aesthetic impacts related to views, aesthetics, and light and glare are generally site-specific. As discussed above, project-related changes would be minimal and impacts to scenic vistas would be less than significant. The proposed project would not substantially change the on-site visual character because the new visual elements would not be dissimilar from the existing visual environment. The project also would not alter the balance of the surrounding areas and they would retain their exiting character. New sources of lighting from the signalization and streetlights would be consistent with the other recent improvements along Corral Hollow Road and would not make a substantial contribution to new light sources in the area. Similar to the proposed project, other projects would be required to use lights that are shielded and directed. Therefore, while the proposed would make minor change the appearance of the site, this project in conjunction with other past, present, and reasonably foreseeable projects in the vicinity would follow applicable local planning and design guidelines regarding roadway design including materials, coloration, and landscaping. This would serve to minimize the effects to aesthetic resources and cumulative impacts would be less than significant.

AGRICULTURE AND FORESTRY RESOURCES

ENVIRONMENTAL IMPACTS Issues		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.	**AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:**				
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?		**X**		
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?			**X**	
c)	Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?			**X**	
d)	Result in the loss of forest land or conversion of forest land to non-forest use?			**X**	
e)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?			**X**	

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Potentially Significant Unless Mitigation Incorporated. Based on the California Department of Conservation Important Farmland Monitoring and Mapping Program (FMMP), the project site is located on Urban and Build and Prime Farmland. Urban and Built-up Land is defined as land that is occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airport, golf courses, sanitary landfills, sewage treatment, and water control structures.

Prime Farmland is irrigated land with the best combination of physical and chemical features able to sustain long term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for production of irrigated crops at some time during the four years prior to the mapping date. The FMMP shows that approximately,1.60 acres of APN 025-302-012 is within a 146.9-acre area that is designated as Prime Farmland and would be converted to a nonagricultural use. The majority of the area, however, would not be modified and the area used for the retention basin and most of the surrounding area would not be paved. Thus, while the area would be changed from its exiting use as an orchard the soils that are valuable for agricultural would not be permanently lost.

In addition, the potential environmental impacts from development of the roadway and project area for urban uses and the associated removal of Prime Farmland for agricultural use were considered and addressed in the City of Tracy General Plan and Final EIR. The EIR disclosed that buildout of the General Plan would result in the conversion of farmland and it result in a significant and unavoidable impact. While mitigation measures, were adopted to minimize the loss, on February 1, 2011, the Tracy City Council adopted a Statement of Overriding Considerations (Resolution 2011-028) for conversion of agricultural land within the City. Mitigation measures include the implementation of a “Right to Farm” ordinance by the City (Or. 10.24 et seq.) that is intended to preserve and protect existing agricultural operations within the incorporated City, and participation in the City’s agricultural mitigation fee program (Tracy Municipal Code, Chapter 13.26).

Although, the 1.6 acres is identified as Prime Farmland, this area is identified in the General Plan for use as urban reserve. The balance of the project areas is identified for use as industrial and commercial, and the remainder is already used as roadway and unproductive roadway right-of-way. Thus, development of the project area for future urban land uses was planning in the Tracy General Plan and implementation of the proposed project would not create new impacts over and above those identified in the General Plan Final EIR and would not significantly change previously identified impacts.

As part of the development process for individual site-specific projects, the agricultural mitigation fee adopted by the City shall be paid for each acre of Prime Farmland to be converted. The fee is outlined in Chapter 13.28, Agricultural Mitigation Fee, of the Tracy Municipal Code. The fees shall be collected by the City at the time building permits are issues for such site-specific projects, or as

otherwise required by the City of Tracy. The proposed project would be subject to the agricultural mitigation fee, as required by Mitigation Measure **MM AG-1**. With implementation of this mitigation measure, the proposed project would have a less than significant impact relative to this issue.

MM AG-1: Prior to issuance of a grading permit, the City of Tracy shall pay the adopted agricultural mitigation fee for each acre of Prime Farmland converted. The fee shall be collected prior to construction. The acreage of Prime Farmland developed shall be determined once the final improvement plans are submitted to the City, and the acreage shall be noted on the improvement plans.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Less Than Significant Impact. Refer to a), above. The 2015 San Joaquin County Williamson Act Parcel map viewer from August, shows the portion of the site within APN 025-302-012 is under a Williamson Act contract. The area, however, is not shown under the more recent San Joaquin County Agricultural Preserve Zone. The portion of the proposed project in this area is designated in the General Plan as Urban Reserve and does not have existing zoning for agricultural use. This renders the project consistent with the buildout development scenario contemplated in the General Plan and preciously analyzed in the General Plan EIR.

In addition, and as discussed above, the majority of the 1.6-acre area would remain undeveloped, would not contain hardscape, and would be used for roadway shoulder and retention basin. As such, while the area would be taken out of agricultural production and approximate 151 orchard trees would be removed, the existing soils which are a large part of the property's value for agricultural production would remain. In addition, the proposed project would not result in any greater impacts associated with conversion of Williamson Act lands than identified in the General Plan EIR, impacts would not be greater than previously analyzed. Thus, impacts for the purpose of this project, would be less than significant, and additional mitigation is not required.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Less Than Significant Impact. The project is not zoned as forest land, timberland, or timberland production and no land in the project vicinity is. Therefore, the proposed project would not conflict or cause rezoning of any forest land (as defined in Public Resource Code section 12220(g)) timberland (as defined by Public Resources Code section 4526), or zoned Timberland Production (as defined by Government Code section 51104(g)). Therefore, impacts related to the loss of this agricultural resource are less than significant.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to c), above.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to a) and c)

Cumulative Impacts

The proposed project includes transportation improvements and roadway widening needed to accommodate future development envisioned by the General Plan. The proposed project would occur within areas that are identified for development and are designated as industrial, commercial, urban reserve. Implementation of the proposed project would not induce any additional or new population growth not already identified in the General Plan or studied in the General Plan EIR. As discussed above, with implementation of Mitigation Measure AG-1, the proposed project would pay appropriate development fees as would other past, present, and reasonably foreseeable projects that fall within qualified areas designated as farmland. Thus, the proposed project would not result in new impacts related to agricultural resources, nor would the proposed project result in an increase in the severity of an impact related to agricultural resources previously disclosed in the General Plan EIR. Therefore, the proposed project would not cause either a new cumulative impact to occur, nor a substantial increase in the severity of a cumulative impact previously disclosed.

AIR QUALITY

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
3. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?			**X**	
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?			**X**	
c) Expose sensitive receptors to substantial pollutant concentrations?			**X**	
d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?			**X**	

REGULATORY SETTING

Federal

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the U.S. Environmental Protection Agency (EPA) developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter 10 microns in diameter or less (PM_{10}), particulate matter 2.5 microns in diameter or less ($PM_{2.5}$), and lead. Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "nonattainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires that each state prepare a State Implementation Plan (SIP) to demonstrate how it will attain the NAAQS within the federally imposed deadlines.

The EPA has designated enforcement of air pollution control regulations to the individual states. Applicable federal standards are summarized in *Table 4-1: State and Federal Ambient Air Quality Standards.*

California Air Resources Board

The California Air Resources Board (CARB) administers California's air quality policy. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. These standards, included with the NAAQS in *Table 4-1*, are generally more restrictive than federal standards for each of the criteria pollutants except for lead and the 8-hour average for CO.

Table 4-1: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	Federal Primary Standards	California Standard
Ozone	1-Hour	---	0.09 ppm
	8-Hour	0.070 ppm	0.070 ppm
Carbon Monoxide	8-Hour	9.0 ppm	9.0 ppm
	1-Hour	35.0 ppm	20.0 ppm
Nitrogen Dioxide	Annual	0.053 ppm	0.030 ppm
	1-Hour	0.100 ppm	0.18 ppm
Sulfur Dioxide	Annual	---	---
	24-Hour	---	0.04 ppm
	1-Hour	0.075 ppm	0.25 ppm
PM_{10}	Annual	---	20 $\mu g/m^3$
	24-Hour	150 $\mu g/m^3$	50 $\mu g/m^3$
$PM_{2.5}$	Annual	12 $\mu g/m^3$	12 $\mu g/m^3$
	24-Hour	35 $\mu g/m^3$	---
Lead	30-Day Average	---	1.5 $\mu g/m^3$
	Rolling 3-Month Average	0.15 $\mu g/m^3$	---

ppm = parts per million;
µg/m3 = micrograms per cubic meter

Regional

San Joaquin Valley Air Pollution Control District (SJVAPCD)

The project site lies within the northern portion of the San Joaquin Valley Air Basin (SJVAB). The San Joaquin Valley Air Pollution Control District (SJVAPCD) has jurisdiction over most air quality matters in the SJVAB and is tasked with implementing programs and regulations required by the FCAA and CCAA. If a project is found to interfere with the region's ability to comply with NAAQS and CAAQS, local governments then need to consider project modifications or provide mitigation measures to eliminate the inconsistency of the project plans. In order for a project to be considered "consistent" with the latest Air Quality Plan (AQP), the project must be consistent with the goals, objectives, and assumptions in the respective plan to achieve Federal and State air quality standards. Additionally, both construction-related and long-term emissions are required to be quantified and compared to the SJVAPCD significance thresholds.

Local air districts and CARB monitor ambient air quality to ensure that air quality standards are met, and if they are not met, to also develop strategies to meet the standards. Air quality monitoring stations

measure pollutant ground-level concentrations (typically, 10 feet above ground level). Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "non-attainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. *Table 4-2: Attainment Status of the San Joaquin Valley Air Basin* summarizes the State and federal attainment status for criteria pollutants in the SJVAB.

Table 4-2: Attainment Status of the San Joaquin Valley Air Basin

Pollutant	State Standard	Federal Standard
Ozone (O_3) – 1-Hr Standard	**Severe Non-attainment**	No Federal Standard
Ozone (O_3) – 8-Hr Standard	**Non-attainment**	**Extreme Non-attainment**
Inhalable Particulates (PM_{10})	**Non-attainment**	Attainment-Maintenance
Fine Particulates ($PM_{2.5}$)	**Non-attainment**	**Non-attainment**
Carbon Monoxide (CO)	Attainment	Attainment-Maintenance
Nitrogen Dioxide (NO_X)	Attainment	Attainment
Sulfur Dioxide (SO_X)	Attainment	Attainment
Lead (Pb)	Attainment	No Federal Standard

Notes:
1. The Valley is designated nonattainment for the 1997 federal $PM_{2.5}$ standard. U.S. EPA released final designations for the 2006 $PM_{2.5}$ standards (effective in 2009), designated the Valley as nonattainment.
2. On May 5, 2010 the Valley was reclassified to extreme attainment in the Federal Register (effective June 4, 2010).
3. Effective June 15, 2005, the U.S. Environmental Protection Agency (U.S. EPA) revoked the federal 1-hour ozone standard, including associated designations and classifications. EPA had previously classified the SJVAB as extreme nonattainment for this standard. EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan on March 8, 2010 (effective April 7, 2010). Many applicable requirements for extreme 1-hour ozone nonattainment areas continue to apply to the SJVAB. In 2011, U.S. EPA indicated it plans to designate the entire State as attainment/unclassified for the 2010 NO2 standard. Final designations have yet to be made by U.S. EPA.

Non-attainment pollutants are highlighted in **Bold**.

As shown in *Table 4-2*, although the SJVAB is in attainment as to all NAAQSs, it is designated as non-attainment with respect to the more stringent State PM_{10} standard and the State's 8-hour ozone standard.

Clean Air Plan

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans. The FCAA and CCAA require plans to be developed for areas designated as nonattainment (with the exception of areas designated as nonattainment for the state PM_{10} standard). The SJVAPCD is responsible for developing a Clean Air Plan, which guides the region's air quality planning efforts to attain the CAAQS. The SJVAPCD adopted the 2022 Ozone Plan and 2018 $PM_{2.5}$ Plan.

SJVAPCD periodically develops air quality plans that outline the regional strategy to improve air quality and protect the climate. The most recent plan, 2018 Plan for the 1997, 2006, and 2012 $PM_{2.5}$ Standards, includes a wide range of control measures designed to reduce emissions of air pollutants and GHGs.

Local

City of Tracy General Plan

The City of Tracy General Plan Air Quality Element includes the objectives and policies intended to control or reduce air pollution impacts. Relevant policies are listed below:

Objective AQ-1.1: Improve air quality and reduce greenhouse gas emissions through land use planning decisions.

Objective AQ-1.2: Promote development that minimizes air pollutant and greenhouse gas emissions and their impact on sensitive receptors as a result of indirect and stationary sources.

P1. The City shall assess air quality impacts using the latest version of the CEQA Guidelines and guidelines prepared by the San Joaquin Valley Air Pollution Control District.

P2. The City shall assess through the CEQA process any air quality impacts of development projects that may be insignificant by themselves, but cumulatively significant.

P3. Developers shall implement best management practices to reduce air pollutant emissions associated with the construction and operation of development projects.

P13. Dust control measures consistent with San Joaquin Valley Air Pollution Control District rules shall be required as a condition of approval for subdivision maps, site plans, and all grading permits.

P14. Developments that significantly impact air quality shall only be approved if all feasible mitigation measures to avoid, minimize or offset the impact are implemented.

Objective AQ-1.3: Provide a diverse and efficient transportation system that minimizes air pollutant and greenhouse gas emissions.

P1. The City shall continue to work with the San Joaquin Council of Governments on regional transportation solutions.

THRESHOLDS

The City of Tracy, including the project site, is located within the northern portion of the San Joaquin Valley Air Basin (SJVAB) and is within the jurisdictional boundaries of the SJVAPCD. The SJVAB area is currently designated as a non-attainment area for the State and federal O_3, State and federal $PM_{2.5}$, and State PM_{10} standards. The SJVAB is designated attainment or unclassified for all other NAAQS and CAAQS. It should be noted that although the EPA revoked their 1-hour ozone standard in 2005, in May of 2016, the EPA proposed findings that the SJVAB was in attainment of the 1-hour ozone standard.

In compliance with regulations, due to the non-attainment designations of the area, the SJVAPCD periodically prepares and updates air quality plans that provide emission reduction strategies to achieve attainment of the NAAQS and CAAQS, including control strategies to reduce air pollutant emissions through regulations, incentive programs, public education, and partnerships with other agencies. The most recent ozone plan is the 2016 Ozone Plan for the 2008 8-Hour Ozone Standard, which was adopted by the SJVAPCD on June 16, 2016. CARB subsequently conducted a public meeting to consider approval of the 2016 Ozone Plan for the 2008 8-Hour Ozone Standard, and approved the plan on July 21, 2016. Additionally, the most recent federal attainment plan for PM is the 2016 Plan for the 1997 $PM_{2.5}$ Standard, which was approved by the District Governing Board on April 16, 2015.

The aforementioned air quality plans contain mobile source controls, stationary source controls, and transportation control measures (TCMs) to be implemented in the region to attain the NAAQS and CAAQS within the SJVAB. Adopted SJVAPCD rules and regulations, as well as the thresholds of significance, have been developed with the intent to ensure continued attainment of NAAQS and CAAQS, or to work towards attainment for which the area is currently designated non-attainment, consistent with applicable air quality plans. The SJVAPCD has established broad significance thresholds associated with the construction and operation emissions for various criteria pollutants including ozone precursors such as reactive organic gases (ROG) and oxides of nitrogen (NO_X), as well as for PM_{10}, $PM_{2.5}$, SO_X, and CO expressed in tons per year. Thus, by exceeding the SJVAPCD's mass emission thresholds for operational emissions of ROG, NO_X, PM_{10}, $PM_{2.5}$, SO_X, or CO a project would be considered to conflict with or obstruct implementation of the SJVAPCD's air quality planning efforts. The SJVAPCD's adopted thresholds of significance for criteria pollutant emissions are presented in *Table 4-3: SJVAPCD Criteria Pollutant Thresholds of Significance*. If the proposed project's emissions exceed the applicable thresholds of significance presented in the table, the project could violate an air quality standard, contribute to an existing or projected air quality violation or conflict with or obstruct implementation of the applicable air quality plans.

Table 4-3: SJVAPCD Criteria Pollutant Thresholds of Significance

Criteria Air Pollutants and Precursors (Regional)	Construction-Related	Operational-Related
	Average Annual Emissions (tons/year)	Annual Average Emission (tons/year)
Reactive Organic Gases (ROG)	10	10
Nitrogen Oxides (NO_X)	10	10
Carbon Monoxide (CO)	100	100
Sulfur Oxides (SO_X)	27	27
Coarse Particulates (PM_{10})	15	15
Fine Particulates ($PM_{2.5}$)	15	15
Source: SJVAPCD, March 19, 2015.		

ENVIRONMENTAL IMPACTS

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. The SJVAPCD is tasked with implementing programs and regulations required by the FCAA and the CCAA. In that capacity, the SJVAPCD has prepared plans to attain Federal and State ambient air quality standards. To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions in their SJVAPCD Guidance for Assessing and Mitigating Air Quality Impacts (2015). Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan". As discussed in Threshold AQ-2 below, the project would not exceed the any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant threshold.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less Than Significant Impact.

Construction Emissions

Project construction activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the project area include ozone-precursor pollutants (i.e., ROG and NO_x) and PM_{10} and $PM_{2.5}$. Construction-generated emissions are short term and temporary, lasting only while construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SJVAPCD's thresholds of significance.

Construction results in the temporary generation of emissions during land clearing, grading, drainage/utilities installation, paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance, as well as weather conditions and the appropriate application of water.

The duration of construction activities associated with the project are estimated to last approximately three months, beginning in June 2024 and concluding at the end of August 2024. The project's construction-related emissions were calculated using the Sacramento Metropolitan Air Quality Management District's Road Construction Emissions Model (RCEM) (Version 9.0.0), which is designed to model emissions for roadway projects, based on typical construction requirements. The project would export a total of approximately 8,985 cubic yards (cy) and import a total of 217 cy of soil during grading. See Appendix A: Air Quality Modeling Data for additional information regarding the construction assumptions used in this analysis. The project's predicted maximum daily construction-related emissions are summarized in *Table 4-4: Construction-Related Emissions*.

Table 4-4: Construction-Related Emissions

Construction Phase	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_x)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
Project Emissions						
Grubbing/ Land Clearing	0.01	0.05	0.06	<1	0.06	0.01
Grading/ Excavation	0.03	0.3	0.25	<1	0.07	0.02
Drainage/ Utilities/ Sub-Grade	0.02	0.19	0.22	<1	0.08	0.02
Paving	0.01	0.13	0.21	<1	0.01	0.01
Maximum	**0.03**	**0.30**	**0.25**	**<1**	**0.08**	**0.02**
SJVAPCD Significance Threshold [2]	*10*	*10*	*100*	*27*	*15*	*15*
Exceed BAAQMD Threshold?	No	No	No	No	No	No

1. Emissions based on the Sacramento Metropolitan Air Quality Management District Road Construction Emissions Model (Version 9.0.0).
2. SJVAPCD, August 2015.

Source: Refer to the modeling outputs provided in Appendix A.

Fugitive Dust Emissions. Fugitive dust emissions are associated with land clearing, ground excavation, cut-and-fill operations, and truck travel on unpaved roadways. Dust emissions also vary substantially from day to day, depending on the level of activity, the specific operations, and weather conditions. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the project vicinity. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. Pursuant to Regulation VIII, the project would be required to control fugitive dust. The RCEM model assumes a 50 percent control of fugitive dust from water and associated control measures.

Construction Equipment and Worker Vehicle Exhaust. Exhaust emission factors for typical diesel-powered heavy equipment are based on the RCEM defaults. Variables factored into estimating the total construction emissions include the following: level of activity, length of construction period, number of pieces/types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported onsite or offsite. Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies to and from the project site, emissions produced on site as the equipment is used, and emissions from trucks transporting materials and workers to and from the site. Emitted pollutants would include ROG, NO_X, PM_{10}, and $PM_{2.5}$.

ROG Emissions. In addition to gaseous and particulate emissions, the application of asphalt and surface coatings creates ROG emissions, which are O_3 precursors. In accordance with the methodology prescribed by the SJVAPCD, the ROG emissions associated with paving have been quantified. Paints would be required to comply with SJVAPCD's Rule 4601 (Architectural Coatings) and limit the amount of ROG emissions from cutback asphalt in compliance with the requirements of SJVAPCD's Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

Summary. As shown in *Table 4-4*, all criteria pollutant emissions would remain below their respective thresholds. As such, the proposed project's construction would not worsen ambient air quality, create additional violations of federal and state standards, or delay the SJVAB's goal for meeting attainment standards. Impacts would be less than significant.

Operational Emissions

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated.

Cumulative Short-Term Emissions

The SJVAB is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for the CAAQS and nonattainment for O_3 and $PM_{2.5}$ for the NAAQS. discussed above, the project's construction-related emissions would not have the potential to exceed the SJVAPCD significance thresholds for criteria pollutants.

Since these thresholds indicate whether an individual project's emissions have the potential to affect cumulative regional air quality, it can be expected that the project-related construction emissions would not be cumulatively considerable. The SJVAPCD recommends consistency Regulation VIII for all projects whether or not construction-related emissions exceed the thresholds of significance. Compliance with SJVAPCD construction-related mitigation requirements are considered to reduce cumulative impacts at a SJVAB-wide level. As a result, construction emissions associated with the project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

Cumulative Long-Term Impacts

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated. Cumulative impacts would not occur.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact. Sensitive land uses are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. The nearest sensitive receptors to the project site include multi-family residences approximately 300 feet to the southeast along Corral Hollow Road.

Construction Toxic Air Contaminants

Construction equipment and associated heavy-duty truck traffic generates diesel exhaust which is a known Toxic Air Contaminants (TAC). Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. However, the use of diesel-powered construction equipment would be episodic and would occur in various phases throughout the linear project site.

Additionally, construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, Sections 2485 and 2449), which reduce diesel PM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. These regulations would further reduce nearby sensitive receptors' exposure to temporary and variable diesel PM emissions. Given the temporary and intermittent nature of construction activities likely to occur within specific locations in the project site (i.e., construction is not likely to occur in any one location for an extended time), the dose of diesel PM of any one receptor is exposed to would be limited. A less than significant impact would occur in this regard.

Operational Toxic Air Contaminants

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated and no impact with regard to toxic air contaminants would occur.

Carbon Monoxide Hotspots

The primary mobile-source criteria pollutant of local concern is carbon monoxide. Concentrations of CO are a direct function of the number of vehicles, length of delay, and traffic flow conditions. Transport of this criteria pollutant is extremely limited; CO disperses rapidly with distance from the source under normal meteorological conditions. Under certain meteorological conditions, however, CO concentrations close to congested intersections that experience high levels of traffic and elevated background concentrations may reach unhealthy levels, affecting nearby sensitive receptors. Areas of high CO concentrations, or "hot spots," are typically associated with intersections that are projected to operate at unacceptable levels of service during the peak commute hours. CO concentration modeling is therefore typically conducted for intersections that are projected to operate at unacceptable levels of service during peak commute hours.

Although the SJVAPCD has not established a specific numerical screening threshold for CO impacts, the Bay Area Air Quality Management District (BAAQMD) has established that CO impacts may be determined to be less than significant if a project would not increase traffic volumes at local intersections to more than 44,000 vehicles per hour, or 24,000 vehicles per hour for locations in heavily urban areas, where "urban canyons" formed by buildings tend to reduce air circulation. Traffic would increase along surrounding roadways during long-term operational activities.

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, the project would not have the potential to create a CO hotspot and impacts would be less than significant.

d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?

Less Than Significant Impact.

Construction

Construction activities associated with the project may generate detectable odors from heavy duty equipment (i.e., diesel exhaust), as well as from architectural coatings and asphalt off-gassing. Odors generated from the referenced sources are common in the man-made environment and are not known to be substantially offensive to adjacent receptors. Any construction-related odors would be short-term in nature and cease upon project completion. As a result, impacts to existing adjacent land uses from construction-related odors would be short-term in duration and therefore would be less than significant.

Operational

According to the SJVAPCD, land uses associated with odor complaints typically include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants. The project does not include any uses identified by the SJVAPCD as being associated with odors. Nonetheless, the project would be subject to the SJVAPCD's Rule 4102, which allows members of the public to submit complaints regarding odor. Impacts would be less than significant.

Cumulative Impacts

The SJVAPCD does not include separate significance thresholds for cumulative operational emissions. As discussed in Threshold b) above, the project would not exceed the any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant threshold. The SJVACPD notes that the nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size by itself to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. Consistency with the SJVAPCD control measures would ensure that the project would not cumulatively contribute to air quality impacts in the SJVAB. Therefore, the project's cumulative contribution of air quality

emissions would be less than significant, and the project's cumulative air quality impacts would also be less than cumulatively considerable.

BIOLOGICAL RESOURCES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
4. BIOLOGICAL RESOURCES. Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		**X**		
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?			**X**	
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological			**X**	
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		**X**		
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			**X**	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?		**X**		

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Potentially Significant Unless Mitigation Incorporated. Special-status species includes plant and/or wildlife species that are legally protected under the federal Endangered Species Act, the California Endangered Species Act, or other regulations, or are considered rare enough by the scientific community and trustee agencies to warrant special consideration.

The project site is located within the existing road grades at the intersection of Corral Hollow Road and Linne Road. Both roads will be widened at the intersection to provide both through lanes and right-turn lane pockets, which will require the acquisition of new right of way (ROW), as well as utility relocation. Agriculture uses are present on the west side on the project site and commercial uses on the east. Additionally, the project site is primarily in the ROW and previously disturbed with no native vegetation.

Many special-status plant species were identified by the CNDDB, CNPS, and USFWS databases as having potential to occur in the region (see Appendix B). However, no special-status plant species are expected to occur in the BSA due to the lack of suitable habitat. No special-status plant species were observed during the biological reconnaissance-level survey, or in previous surveys conducted within the BSA. Since special-status plant species are not expected to occur within the BSA, the project would not impact any special-status plants.

Three surveys were conducted in 2018 for the Corral Hollow Road Widening Phase 2 Linne Road to I-580 Project. This road widening project overlaps the proposed project along Corral Hollow Road, and within the orchard. These surveys were conducted by Steve McMurtry of De Novo Planning Group to evaluate biological conditions within the project area (Horizon Water and Environment, 2022). Horizon Water and Environment conducted a reconnaissance survey of the BSA on May 2, 2022, see Appendix B. The survey was conducted on-foot in all accessible areas within BSA. Natural and anthropogenic features, land cover types, and the presence of common and special-status species were visually surveyed. Visual aids, such as binoculars, were used to better assess survey areas and wildlife species when appropriate. As described in the *Biological Technical Memorandum* (Appendix B) San Joaquin kit fox (Vulpes macrotis mutica) are known to occur in the vicinity of the BSA (Appendix B). Burrowing owl (Athene cunicularia) and Swainson's hawk (Buteo swainsoni) are known to occur at several locations within 5 miles of the proposed project. A Swainson's hawk was also observed perching on a power pole in the BSA during the May reconnaissance survey. Several species of special-status bats may forage over the BSA, including pallid bat (Antrozous pallidus), Townsend's big-eared bat (Corynorhinus townsendii), and western mastiff bat (Eumops perotis californicus). The special-status species with potential to occur include San Joaquin kit fox, Swainson's hawk, burrowing owl, pallid bat, Townsend's big-eared bat, and western mastiff bat.

The SJMSCP provides coverage for impacts to biological resources pursuant to the California Environmental Quality Act (CEQA), the California Endangered Species Act (CESA) and Federal Endangered Species Act (FESA) and is approved and authorized by the California Department of

Fish and Game and the United States Fish and Wildlife Service. Pursuant to these authorizations, applications must be prepared by the lead agency and submitted to the San Joaquin County Council of Governments, Inc. (SJCOG) for accounting and reporting purposes and to guide those participating in the Plan to comply with the provisions of the SJMSCP. Alternatively, the City of Tracy may "opt out" for this project if the City mitigates for identified biological impacts on its own. If the City decides to opt-out of the SJMSCP, the city would be required to conduct pre-construction surveys and ensure that mitigation is appropriately completed without SJCOG support. The specifies identified below would be protected as required by CDFW and USFWS regulations. The below listed mitigation would provide protection of the species through pre-construction surveys and protective measures during construction and would have the option to opt-out of the SJMSCP. Overall, with the implementation of Mitigation Measures **MM BIO-1** through **MM BIO-4**, impacts would be less than significant.

San Joaquin Kit Fox

The BSA is mainly comprised of roadways and orchard. These areas may be utilized by San Joaquin kit fox for dispersal and occasional foraging but are generally not suitable for extended periods of occupation (USFWS 2010). No dens were observed during reconnaissance surveys. Due to the very limited extent of suitable habitat, this species is considered unlikely to occur in the BSA. Although it is unlikely that San Joaquin kit fox would occur within the BSA, construction activities could create temporary barriers to movement and dispersal of this species. Potential impacts to San Joaquin kit fox would be reduced to a less than significant level by implementing Mitigation Measure **MM BIO-2**, which requires pre-construction surveys for San Joaquin kit fox dens and additional avoidance or minimization measures.

Swainson's Hawk

A Swainson's hawk was observed perching on a power pole in the BSA during the May reconnaissance survey. No suitable nesting habitat for this species is present within the BSA. Marginally suitable nesting habitat is present in the tree located to the northeast of the intersection of Corral Hollow Road and the Delta Mendota Canal, to the southeast of the BSA. Trees that provide marginally suitable nesting habitat area also present in the residential development to the north of W. Linne Road. This species may also forage within or adjacent to the BSA. Although no nesting habitat is present within the BSA, this species could nest in the marginally suitable habitat that is present within ½ mile of the BSA. Construction could disturb nesting Swainson's hawk through generation of noise or visual distraction. No suitable nesting habitat would be removed by the project. The project would not remove foraging habitat for Swainson's hawk but would result in temporary noise and visual disturbance during construction that could cause these species to avoid foraging within or adjacent to the BSA. Due to the large amount of foraging habitat available in the region, this would not be a significant impact. Implementation of **MM BIO-3** would reduce impacts to Swainson's hawk to a less than significant level.

Burrowing Owl

No burrows potentially suitable for burrowing owl were observed during reconnaissance surveys, and no burrowing owls, whitewash, or other evidence of occupation by burrowing owls was

observed. Burrowing owl could forage within the vicinity of the BSA. However, this species may disperse and colonize suitable habitat within the BSA. If present in the vicinity of the BSA, construction could disturb burrowing owls through noise, visual distraction, or direct impacts to occupied habitat. Implementation of **MM BIO-4** would reduce potential impacts on burrowing owls to a less than significant level.

Special-Status Bats

Several species of special-status bats may forage over the BSA, including pallid bat, Townsend's big-eared bat, and western mastiff bat. Suitable roosting habitat for these species is not present within the BSA. Construction of the project is anticipated to have minimal impacts on bat foraging, and no impacts on bat roosting. Therefore, impacts would not be significant, and no mitigation would be required.

Nesting Birds

Two inactive nest structures were observed in a shrub within the BSA during the May 2022 survey. Trees and shrubs within and adjacent to the BSA provide suitable nesting substrate for bird species protected by Migratory Bird Treaty Act (MBTA). Impacts to active nests belonging to MBTA- and California Fish and Game Code (CFGC)-protected bird species could occur throughout the BSA and immediately surrounding nesting substrate from construction activities. Indirect effects including project-related noise and vibration generated from nearby construction activities may disrupt nesting activity or nest fitness that could result in nest abandonment, potentially to the point of nestling mortality. Suitable nesting substrate occurs in shrubs and trees in and surrounding the BSA, and MBTA-protected bird species could nest within and adjacent to the BSA. Therefore, active nests of MBTA-protected species could be impacted by the project. Active bird nests protected by CFGC sections 3503 and 3503.5, as well as the MBTA will be avoided through the implementation of **MM BIO-4.** Impacts would therefore be reduced to a less than significant level.

MM BIO-1: **BIO-1, San Joaquin County Multi-Species Habitat Conservation and Open Space Plan.** Prior to any ground disturbance, the City shall,) participate in the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) and comply with all required Incidental Take Minimization Measures.

MM BIO-2: **Avoid and Minimize Impacts to San Joaquin kit fox.** Prior to any ground disturbance, the City shall ensure that:

- A qualified biologist will conduct preconstruction surveys no less than 14 days and no more than 30 days before the commencement of activities to identify potential dens more than 5 inches in diameter within 200 feet of ground disturbing activities. The City will implement USFWS' (2011) Standardized Recommendations for Protection of San Joaquin Kit Fox Prior to or During Ground Disturbance. The City will notify USFWS in writing of the results of the preconstruction survey within 30 days after these activities are completed.
- If potential dens are located within the proposed work area and cannot be avoided during construction activities, a USFWS-approved biologist will

determine if the dens are occupied. If occupied dens are present within the proposed work, their disturbance will be avoided. Exclusion zones will be implemented following the most current USFWS procedures (currently USFWS 2011). The City will notify USFWS immediately if a natal or pupping den is found in the survey area, and will present the results of pre-activity den searches within 5 days after these activities are completed and before the start of construction activities in the area.

MM BIO-3: **Conduct Swainson's Hawk Surveys.** If construction occurs between February 1 and August 31, the City or its contractor(s) shall require that a qualified biologist conduct surveys no more than 10 days before the start of construction for Swainson's hawk in accordance with the recommended timing and methodology developed by the Swainson's Hawk Technical Advisory Committee (2000 or most recent). Surveys will cover a minimum ½-mile radius around the construction area. If nesting Swainson's hawk are detected, buffers shall be established around active nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active nests will be ½ mile unless a qualified biologist determines, based on a site-specific evaluation, that a smaller buffer is sufficient to avoid impacts on nesting raptors. Factors to be considered when determining buffer size include the presence of natural buffers provided by vegetation or topography, nest height, locations of foraging territory, and baseline levels of noise and human activity. Buffers shall be maintained until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival.

MM BIO-4: **Nesting Bird Avoidance.** To the extent feasible, construction activities should be scheduled to avoid the nesting season. If project activities are scheduled to take place outside the nesting season, impacts to nesting birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Joaquin County extends from February 1 through August 31. 31.If it is not possible to schedule project activities outside the nesting season, then the following measures will be implemented:

- A qualified biologist will conduct pre-construction surveys for nesting birds. These surveys shall be conducted no more than seven days prior to the initiation of project activities, including tree and vegetation removal. During these surveys, the biologist shall inspect all trees and other potential nesting habitats (e.g., shrubs, ruderal areas, burrows, and structures) in and immediately adjacent to the construction areas for nests.

- If an active nest is found sufficiently close to work areas to be disturbed by these activities, a non-disturbance buffer zone will be established around the nest at the biologist's discretion and in accordance with regulatory permits and conditions to ensure that no nests of special-status species or species protected by the MBTA and California Fish and Game Code shall be disturbed

during project implementation. Buffers zones will remain until the birds have fledged or the nest is no longer active as determined by a qualified biologist.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Less than Significant Impact. As there are no streams on or near the project site, there is no riparian habitat. Additionally, the US Fish and Wildlife Service did not identify any other sensitive natural communities on the National Wetlands Mapper Inventory. No natural communities of special concern, wetlands, or waters of the United States were identified within the BSA. The project would have a less than significant impact on these habitats.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological?

Less Than Significant Impact. As identified from the US Fish and Wildlife National Wetlands Mapper, there are no identified state or federally protected wetlands mapped within the project site (USFWS, 2022). Therefore, there is a less than significant impact.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Potentially Significant Unless Mitigation Incorporated. As noted, there are no streams on or near the project site. The project site is not a known wildlife migration corridor and is unlikely to be one, given its location amid urban development. However, the project site contains trees around the perimeter of the site and within the new right of way and temporary construction easement. The trees could be used by raptors and other migratory birds during their nesting seasons. If these trees are removed during nesting seasons for these birds, this could have a direct, adverse impact. However, with the implementation of **MM BIO-3**, impacts would be reduced to a level that would be less than significant.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant Impact. The City has a tree ordinance (Tracy Municipal Code [TMC] (Chapter 7.08) that protects “street trees” planted within rights-of-way or planting easements. A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Additionally, approximately 151 other trees would be removed, for new right-of-way and a temporary construction easement. Street tree removal, alteration, and maintenance associated with the project would be in compliance with the City’s Municipal Code, Chapter 7.08.020. Therefore, the project would have a less than significant impact on local biological requirements.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Potentially Significant Unless Mitigation Incorporated. As stated above, project site is located within the jurisdiction of the SJMSCP, the City of Tracy shall consult with SJCOG and investigate coverage of the project pursuant to the SJMSCP. The proposed project site primarily contains land areas that are classified land category/pay zone: Category A – Exempt No Pay Zone and Category C Ag Habitat Open Space, Pay Zone B (Agricultural) under the SJMSCP. The proposed project is consistent with the SJMSCP and coverage under the plan can be done. Alternatively, the City of Tracy may "opt out" for this project if the City mitigates for identified biological impacts on its own. If the City decides to opt-out of the SJMSCP, the city would be required to conduct pre-construction surveys and ensure that mitigation is appropriately completed without SJCOG support. As discussed above under impact a) **MM BIO-1** which would require consultation with SJOG would reduce impacts to a less than significant level.

Cumulative Impacts

Overall, the project is a previously disturbed with existing development located next to an urban environment. Therefore, the development of project site would not be cumulatively considerable. In addition, the site in not located within a known habitat corridor and does not contain any riparian habitat, federally protected wetlands, or other sensitive natural communities. Though the project is located within the SJMSCP, it would comply with all policies, fees, and mitigation measures associated. Therefore, with the above-mentioned mitigation measures the project would have a less than significant impact on biological resources.

CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Impact		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
5.	**CULTURAL RESOURCES. Would the project:**				
a)	Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?			**X**	
b)	Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?		**X**		
c)	Disturb any human remains, including those interred outside of dedicated cemeteries?			**X**	

a) Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?

Less Than Significant Impact. A *Historical Resources Evaluation Report* (HRER) was prepared for the project in 2022 and is attached as Appendix C. The HRER evaluates potential historical resources for inclusion in the California Register of Historical Resources (CRHR) in accordance with Section 15064.5(a) of the California Environmental Quality Act (CEQA) Guidelines. A records search (IC File Number. 19-2028) was conducted by the Central California Information Center (CCIC) on May 3, 2022, and a supplemental request (under the same IC File Number) on May 5, 2022. The CCIC, an affiliate of the California Office of Historic Preservation (OHP), is the official State repository of cultural resource reports for San Joaquin County. The records search included the APE and an additional 0.25-mile radius around the project area. The results of the records search indicate two historic properties or previously recorded historical resources within the APE or the 0.25-mile radius around the APE:

- 39-000089 Delta Mendota Canal (multiple addresses)
- 39-000098 Western Pacific Railroad (WPRR) (multiple addresses)

Field investigations were undertaken by a qualified architectural historian, Kara Brunzell, on May 13, 2022. Each parcel was observed from the public right of way and all visible facades were photographed. Ms. Brunzell inspected all photographs collected in order to make recommendations regarding potential architectural significance and historic integrity.

Two properties were recorded within the APE, including one rural-residential complex (MR2) and one residential property (MR1). DPR 523 series forms, which thoroughly describe each resource, are included in Appendix C. The properties are recommended not eligible for listing on the NRHP or CRHR.

One previously identified historic property, the Delta-Mendota Canal, has been determined eligible for the NRHP but is located outside the APE. Therefore, the APE contains one previously known historic property, the Western Pacific Railroad. The WPRR (MR3), which was completed in 1908, has been recorded many times over the years beginning in 1994, and several studies have included evaluations and integrity assessments of specific stretches of the railroad alignment. The railroad alignment could not be reevaluated for this study because only a short segment, roughly 20 foot by 80 foot stretch that crosses Corral Hollow Road just north of Linne Road, of the linear resource (which is over 700 miles long) is within the APE for this project. The WPRR is therefore being assumed eligible for listing on the NRHP for the purposes of the project pursuant to Stipulation VIII.C.4 of Caltrans' Section 106 PA. Though the WPRR is within the APE, the proposed project would not result in any alteration to the existing structure. Therefore, the project would have a less than significant impact and not cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Potentially Significant Unless Mitigation Incorporated. As indicated above An Ar*chaeological Survey Report* (July, 2022) was prepared for the project and is attached as Appendix D. The *Archaeological Survey Report* identified that, through a records search, eight project studies had previously been conducted within the projects area of potential effects (APE). As stated above, the record search determined that one cultural resource, the WPRR (P-39-000098), has previously been recorded in the APE. The records search found no other cultural resources. Additionally, an examination of USGS maps, dating back to 1916, indicated that there was no development in the project APE, other than the presence of the UPRR and Linne Road, until at least 1954. These early maps also indicate that there are no water sources, ephemeral or permanent, in the project vicinity. The closest natural surface water is Corral Hollow Creek located 1.5 miles to the southeast. The entire APE is underlain by Zacharias clay loam. These are deep deposits derived from alluvium on fans extending out from the base of the coastal range to the west. A gravel lens occurs at a depth of approximately 53 inches beneath the ground surface and there is no restrictive layer (hardpan) up to 80 inches in depth (Natural Resources Conservation Service [NRCS] 2022). Zacharias clay loams are Early to Middle Holocene in age (7,000 – 4,000 BP) and, thus, have a high potential to contain buried cultural deposits. However, this potential is influenced by other factors, such as distance to water, ecotone, and slope. As noted above, early maps of the region do not identify a nearby source of viable water. As a result, the potential for buried cultural remains at the project location is severely diminished (Peak 2020:19-20). Further, the following historical organizations were contacted via email on June 24, 2022, to obtain information regarding potential historic resources in the vicinity of the APE: San Joaquin County Historical Society and the Tracy Historical Museum (see Appendix D). The San Joaquin County Historical Society responded in an email on June 27, 2022. They had no information on historical resources in the project area but noted that significant Native American sites are known to exist in Corral Hollow, several miles south of the proposed project. There has been no response from the Tracy Historical Museum, to date.

An archaeological survey of the APE was conducted on May 12, 2022, by Janis Offermann, M.A., RPA, an archaeologist who meets the U.S. Secretary of the Interior's Professional Standards for

Archaeology. Single transects were walked along the current and proposed right of way on the shoulders of Corral Hollow and Linne roads, where ground surface visibility was very good. Areas of expanded right of way that included the orchard at the southwest corner of the Corral Hollow/Linne Road intersection were also examined in approximate 10-meter transects. A small area of proposed new right of way at the southeast corner of the intersection was not surveyed, as the area was fenced and not accessible (see Appendix D). As previously noted, all of the APE had previously been subject to past archaeological survey. No archaeological resources were identified and recorded during the pedestrian survey. Though overall impacts are anticipated to be minor there is the potential of subsurface resources. Though the circumstances would present a low possibility, the following mitigation measures (MM) would reduce impacts in the unanticipated discovery of archaeological resources during construction. With the implementation of **MM CUL-1, MM CUL-2,** and **MM CUL-3** impacts would be less than significant.

MM CUL-1: **Construction Worker Awareness Training:** Prior to the start of ground disturbance, all construction personnel involved with earth-moving activities should be informed that artifacts protected by law could be discovered during excavating. The training should include the appearance of common artifacts and proper notification procedures should artifacts be discovered. This worker training should be prepared and presented by a qualified archaeological professional.

MM CUL-2: **Subsurface Cultural Resources:** The Improvement Plans shall include the following statement: Prior to any ground disturbance the contractor shall demonstrate that a qualified archaeological monitor and a Native American monitor have been retained to perform onsite construction monitoring during the initial grading and excavation phase of the project. If any archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone are uncovered during any on-site construction activities, all work shall be stopped immediately within a 50-foot radius of the find and the qualified archaeologist and Native American Monitor shall evaluate the deposit. The archaeologist and Native American monitor shall 1) evaluate the find(s) to determine if they meet the definition of a historical, archaeological, or cultural resource; and (2) make appropriate recommendations regarding the disposition of such finds prior to issuance of building permits. The qualified archaeologist and Native American monitor shall have authority to halt construction activities temporarily in the immediate vicinity of an unanticipated find. If, for any reasons, the qualified archaeologist or Native American monitor is not present, but construction crews encounter a cultural resource, all work shall stop temporarily within 50 feet of the find until a qualified archaeologist and Native American monitor has been contacted to determine the proper course of action. If the finds do not meet the definition of a historical, archaeological, and cultural resources, no further study or protection is necessary prior to project implementation. If the find(s) does meet the definition of a historical, archaeological, or cultural resource, the find and the area around the find shall be avoided by project activities and a Cultural Resources Treatment Plan as described in MM CUL-3 shall be implemented.

MM CUL-3: **Subsurface Cultural Resources Treatment Plan:** If subsurface testing revealed the presence of cultural resources, the qualified archeologist shall prepare an archaeological resources treatment plan prior to issuance of any grading permits. The treatment plan shall utilize data recovery methods to reduce impacts on subsurface resources. The treatment plan shall contain, at a minimum:

- Identification of the scope of work and range of subsurface effects (including location map and development plan), including requirements for preliminary field investigations.
- Description of the environmental setting (past and present) and the historic/prehistoric background of the parcel (potential range of what might be found).
- Development of research questions and goals to be addressed by the investigation (what is significant vs. what is redundant information).
- Detailed field strategy, including reasonable and good faith efforts to consult with Native American representatives regarding the most appropriate method to record, recover, or avoid the finds and address research goals.
- Analytical methods.
- Report structure and outline of document contents.
- Disposition of the artifacts.
- Appendices: all site records, correspondence, and consultation with Native Americans, etc.

The treatment plan shall be prepared and submitted to the Supervising Environmental Planner for review and approval prior to the issuance of any grading permits.

c) Disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. No human remains are known to be present within the project site. If human remains are found, those remains would require proper treatment in accordance with applicable laws, including Health and Safety Code (HSC) §§ 7050.5-7055 and PRC § 5097.98 and § 5097.99. HSC §§ 7050.5-7055 describe the general provisions for treatment of human remains. Specifically, HSC § 7050.5 prescribes the requirements for the treatment of any human remains that are accidentally discovered during excavation of a site. HSC § 7050.5 also requires that all activities cease immediately, and a qualified archaeologist and Native American monitor be contacted immediately. As required by state law, the procedures set forth in PRC § 5097.98 would be implemented, including evaluation by the County Coroner and notification of the NAHC. The NAHC would then designate the "Most Likely Descendent" of the unearthed human remains. If human remains are found during excavation, excavation would be halted in the vicinity of the discovery and any area that is reasonably suspected to overlay adjacent remains shall remain undisturbed until the County Coroner has investigated, and appropriate recommendations have been made for the treatment and disposition of the remains. Compliance with the established regulatory framework (i.e., HSC § 7050.5-7055 and PRC §§ 5097.98 and 5097.99) would ensure potential project impacts concerning human remains are reduced to less than significant

Cumulative Impacts

Overall, the project would not cause a considerable impact to historical cultural resources, archaeological cultural resources, or human remains. Due to the project location and previously disturbed project site ground, and the addition of the above listed mitigation measures the proposed project would not cause a cumulatively considerable impact to occur.

ENERGY

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
6. ENERGY. Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?			**X**	
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?			**X**	

BACKGROUND

Appendix F of the State CEQA Guidelines requires consideration of the potentially significant energy implications of a project. CEQA requires mitigation measures to reduce "wasteful, inefficient and unnecessary" energy usage (Public Resources Code Section 21100, subdivision [b][3]). According to Appendix F of the CEQA Guidelines, the means to achieve the goal of conserving energy include decreasing overall energy consumption, decreasing reliance on natural gas and oil, and increasing reliance on renewable energy sources. Depending on the nature of a given project, a project may be considered "wasteful, inefficient, and unnecessary" if were to violate state and federal energy standards and/or result in significant adverse impacts related to project energy requirements, energy inefficiencies, energy intensiveness of materials, cause significant impacts on local and regional energy supplies or generate requirements for additional capacity, fail to comply with existing energy standards, otherwise result in significant adverse impacts on energy resources, or conflict or create an inconsistency with applicable plan, policy, or regulation. Projects such as residential, commercial, or industrial, that have daily on-going demands for energy for uses such as heating, cooling, lightings, and that would generate a vehicle trips and vehicle uses that would use fossil fuels, will require sometimes substantial continued energy use through the life of a project. This is different than projects including transportation projects, such as the proposed project where the vast majority of energy is used during construction and relatively minimal amount of energy is needed for long-term lighting (e.g., traffic signals, streetlights, and routine maintenance).

ENVIRONMENTAL IMPACTS

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact. The proposed project consists of roadway widening, lane adjustments and restriping, median installation, curb and gutter, a retention basin, new signals and

streetlights. Energy consumption associated with construction of the proposed project would primarily include the use of diesel fuel from on-road hauling trips, off-road construction diesel equipment (e.g scrapers, blades, dozers, and back-hoe's), and gasoline consumption from on-road worker commute and vendor trips. Temporary electric power during construction for as-necessary lighting and electric equipment (such as computers inside temporary construction trailers, and heating, ventilation, and air conditioning), if needed, would be powered by a generator(s). The amount of electricity used during construction is anticipated to be minimal and additional demand would stem from the use of electrically powered hand tools and equipment. As discussed above, the majority of the energy used during construction would be from fuels, diesel and gasoline, derived from petroleum.

Operational energy would be negligible as the proposed project does not include any new structures or buildings such as commercial, industrial, or residential that would require sustained long-term use of energy or increase trip generation or VMT. Thus, because the project does not include any structures, the amount of electricity required for operation of the project would be extremely low. The only electricity required for the project operation would be for the proposed traffic signals and streetlights.

Estimates of vehicle fuel consumed were derived based on the assumed construction schedule, vehicle miles travelled for haulers and workers provided in the SMAQMD Roadway Construction Emissions Model, and Year 2020 gasoline MPG factors provided by EMFAC2021. Gasoline would be the primary fuel used for worker trips and the proposed project is anticipated to require approximately 2,500 gallons based on the anticipated vehicle miles travelled by the workers, Diesel fuel would be the primary fuel consumed during construction, by construction equipment and based on the phasing of construction would be approximately 14,069 Gallons. Other energy use would be from continued operations and maintenance. Proposed project landscape maintenance activities would generally require a minimal use of fossil fuels to power maintenance equipment such as vehicles and lawn mowers. The energy used to power landscape maintenance equipment would not differ substantially from the energy required for landscape maintenance for similar project. These energy uses are necessary to enable construction of routine maintenance of the proposed project and are not considered wasteful. In addition, because work efforts would use modern equipment designed to reduce fuel consumption, it would not be considered inefficient.

Conclusion

The proposed project would use energy resources for the on-road vehicle trips (e.g., gasoline and diesel fuel) generated by the proposed project, from off-road construction activities associated with the proposed project (e.g., diesel fuel), and from landscape maintenance activities (e.g., gasoline and diesel fuel). Each of these activities would require the use of energy resources.

The proposed project would comply with all applicable Federal, State, and local regulations regulating energy usage. Energy provided to the project site would be from Pacific Gas and Electric (PG&E). PG&E provides electricity and natural gas to the project area and is anticipated to continue to do so for electrifying the signals and lights. PG&E is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the Statewide Renewable Portfolio Standard (RPS) to increase the proportion of renewable energy (e.g., solar

and wind) within its energy portfolio and PG&E is expected to achieve a 50 percent mix of renewable energy resources by 2030. Other Statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies for all City vehicles and those used to intermittently maintain and service the improvements and thereby conserve gasoline and diesel fuel.

As a result, the proposed project would not result in any significant adverse impacts related to project energy requirements, energy use inefficiencies, and/or the energy intensiveness of materials by amount and fuel type for each stage of the project including construction, operations, maintenance, and/or removal, PG&E, the electricity and natural gas provider to the proposed streetlights, maintains sufficient capacity to serve the proposed project. The proposed project would comply with all existing energy standards, including those established by the City of Tracy, and would not result in significant adverse impacts on energy resources. For these reasons, the proposed project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the threshold as described by Appendix F of the CEQA Guidelines. This is a less than significant impact

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. The proposed project would be required to comply with existing regulations, including applicable measures and regulations that would directly reduce energy use. This would include conformance with statewide regulations related to the use of low carbon fuel standards and increasingly stringent Renewable Portfolio Standards. As such, the project would not conflict with any other state-level regulations pertaining to energy. Thus, the proposed project would comply with existing State energy standards and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Impacts in this regard would be less than significant and mitigation is not required.

Cumulative Impacts

As discussed above, the use of fuel consumption during construction of the proposed project would not be inefficient, wasteful, or unnecessary. The proposed project would use an incrementally small volume of fuels and would not substantially affect existing energy or fuel supplies, or resources and new capacity would not be required. Therefore, the project's cumulative contribution of energy use would be less than significant, and the project's cumulative energy impacts would also be less than cumulatively considerable.

GEOLOGY AND SOILS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
7. GEOLOGY AND SOILS. Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			**X**	
ii) Strong seismic ground shaking?			**X**	
iii) Seismic-related ground failure, including liquefaction?		**X**		
iv) Landslides?			**X**	
b) Result in substantial soil erosion or the loss of topsoil?			**X**	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?		**X**		
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?		**X**		
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?			**X**	
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?		**X**		

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. The General Plan EIR identified potential risks associated with ground and earthquake fault rupture in the southwest portion of the Tracy planning area that would include the project area and is anticipated to occur within the buildout timeframe of the General Plan. Fault rupture can occur along or immediately adjacent to faults during an earthquake. Fault rupture is characterized by ground cracks and displacement which would endanger life and property. Damage is typically limited to areas close to the moving fault. While the project site is located in an area that would be susceptible to low to moderate seismicity, no known active faults cross the project site, and the project site is not located within an Alquist-Priolo Earthquake Fault Zone (CDOC, 2022).

The nearest earthquake fault to the project site that is zoned as active by the State of California Geological survey and mapped by the CDOC, is the Black Butte Fault. This fault is located approximately 3.0 miles southwest of the intersection of Corral Hollow Road and Linne Road.

According to the City General plan EIR, the City of Tracy has a low to moderate seismic history and the largest recorded measurable magnitude earthquake measured 3.9 on the Richter Scale. In addition, relatively large earthquakes have historically occurred in the Bay Area (approximately 50 miles to the west) and along the margins of the Central Valley.

The proposed project includes infrastructure, specifically roadway improvements and does not propose the construction of any habitable structures and it would not result in any greater impact than detailed in the General Plan EIR. In addition, as part of the design and approval process, the proposed project would be subject to mitigation measure (MM-GEO-1), which requires site specific design-level geotechnical investigations pursuant to General Plan Safety Element Policy Objective SA-1.1, P2. This requires that geotechnical engineering studies be undertaken for any development in areas where potentially serious geologic risks exist. Although, the project is not anticipated to be substantially affected it would be evaluated for the risk of impacts from seismic activity. Therefore, because the site is not located within an area with known risk of fault rupture and would undergo a geologic hazards investigation to evaluate other potential geologic hazards (discussed below), impacts would be less than significant in this regard.

ii) Strong seismic ground shaking?

Less Than Significant Impact. As discussed above. The City has a low to moderate seismic history and a 3.9 magnitude earthquake is the largest recorded measurable earthquake. When an earthquake occurs, it can result in ground-shaking effects and the impacts can be widespread. Although a function of earthquake intensity, ground shaking effects can be magnified by the underlying soils and geology, which may amplify shaking at great distances it is difficult to predict

the magnitude of ground-shaking following an earthquake. The effects can vary widely in a relatively small area, and different project sites susceptible to ground shaking from faults in the region can differ based on numerous factors. The greatest potential for significant ground shaking in Tracy is believed to be from maximum credible earthquakes occurring on the Calaveras, Hayward, San Andreas, or Greenville faults. In addition, seismic activity can be expected to occur along the western margin of the Central Valley. As with all projects in the area, the proposed project would be designed to accommodate strong earthquake ground shaking and would be designed and construction in compliance with the applicable California building code standards.

Other faults capable of producing ground shaking at the site include the San Joaquin fault, approximately 7 miles to the southern, the Midway fault approximately 7.2 miles to the southwest, and the Corral Hollow-Carnegie fault approximately 11 miles to the southwest. Any of these faults could generate an earthquake capable of causing strong ground shaking experienced at the project site. Earthquakes of Moment Magnitude (Mw) 7 and larger have historically occurred in the region and numerous small magnitude earthquakes occur every year.

In addition, an earthquake of moderate to high magnitude from a fault within the San Francisco Bay Region and along the margins of the Central valley could cause ground shaking at the project site, similar to what has occurred in the past. To minimize potential damage to the proposed project caused by ground shaking, all construction would comply with the latest California Building Code standards, as required by the City of Tracy Municipal Code 9.04.030.

Seismic design provision of current building codes generally prescribes minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead-and-live loads. The code-prescribed lateral forces are generally considered substantially smaller than the comparable forces that would be associated with a major earthquake. Therefore, structures should be able to: (1) resist minor earthquakes without damage, (2) resist moderate earthquakes without structural damage but with some nonstructural damage, and (3) resist major earthquakes without collapse but with some structural as well as nonstructural damage. Use of the California Building Code standards, which include provision for seismic building designs, would ensure that impacts associated with ground shaking would be less than significant.

The Safety Element of the Tracy General Plan includes several goals, objectives and policies to reduce the risks to the community from earthquakes and other geologic hazards. In particular, the following policies would apply to the project site:

> *SA-1.1, Policy P2: Geotechnical reports shall be required for development in areas where potentially serious geologic risks exist. These reports should address the degree of hazard, design parameters for the project based on the hazard, and appropriate mitigation measures.*
>
> *SA-1.2, Policy P1: All construction in Tracy shall conform to the California Building Code and the Tracy Municipal Code including provisions addressing unreinforced masonry buildings.*

The City would review the proposed project as it does all projects for consistency with the General Plan policies and California Building Code provisions identified above and as applicable. This review would occur during the project application review and processing stage and throughout plan check and building inspection phases. Since the majority of work under the scope of this project involves

roadway improvements, the relevant Caltrans, State, and FHWA codes and requirements would be used.

Consistency with the requirements of the California Building Code and the Tracy General Plan policies identified above would ensure that impacts on humans associated with seismic hazards would be less than significant and additional mitigation would not be required.

iii) Seismic-related ground failure, including liquefaction?

Potentially Significant Unless Mitigation Incorporated. Seismically induced liquefaction occurs when loose, water-saturated sediments of relatively low density are subjected to cyclic shaking that causes soils to lose strength or stiffness because of increased pore water pressure. The project does not fall within any liquefaction zones identified in the Seismic Hazards Map by the California Geological Survey (DOC, 2017). During an earthquake, ground shaking may cause certain types of soil deposits to lose shear strength, resulting in ground settlement, oscillation, loss of bearing capacity, landslides, and the buoyant rise of buries structures. The majority of liquefaction hazards are associated with sandy soils, silty soils of low plasticity, and some gravelly soils. Cohesive soils are generally not considered to be susceptible to liquefaction. In general, liquefaction hazards are more severe within the upper 50 feet of the surface, except where slope faces or deep foundations are present.

Expansive soils are those that undergo volume changes as moisture content fluctuates; swelling substantially when wet or shrinking when dry. Soil expansion can damage structures by cracking foundations, causing settlement and distorting structural elements. Expansion is a typical characteristic of clay-type soils. Expansive soils shrink and swell in volume during changes in moisture content, such as a result of seasonal rain events, and can cause damage to foundations, concrete slabs, roadway improvements, and pavement sections.

Soil expansion is dependent on many factors. The more clayey, critically expansive surface soil and fill material are subjected to volume changes during seasonal fluctuations in moisture content. According to the City of Tracy General Plan Draft EIR, portions of the Tracy Planning Area have a moderate to high risk for expansive soils. The General Plan EIR indicates that with the implementation of objectives, policies, and actions from the General Plan Safety Element, this potentially significant impact would be reduced to less than significant.

The project site is not designated within one of the above zones and the soils in the Tracy area are not considered to be susceptible to liquefaction, even though the groundwater is high, because the near surface soils are predominantly clays or sands with high silt and clay content (San Joaquin County, 1992). In addition, new roadways and infrastructures included in the project would be required by State law to be constructed in accordance with all applicable IBC and CBC earthquake construction standards, including those relating to soil characteristics, and adherence to **MM GEO-1**. The potential for substantial adverse effects to the project due to seismic-related ground failure, including liquefaction would therefore be less than significant.

MM GEO-1: Prior to earthmoving activities, a certified geotechnical engineer, or equivalent shall be retained to perform a final geotechnical evaluation of the soils at a design level. The final geotechnical evaluation shall include design recommendations to

ensure that soils conditions do not pose a threat to the health and safety of people or structures. The grading and improvement plans shall be designed in accordance with the recommendations provided in the final geotechnical evaluation.

iv) Landslides?

Less Than Significant Impact. The project site is relatively flat and does not have any substantial slopes and is not adjacent to an area with substantial slopes. According to the City's General Plan EIR, the landslide risk in Tracy is low in most areas including the project site and the potential for risks from landslides is similarly low. The project site is not located along riverbanks, foothills, or mountain terrain, that would make it susceptible to landslides. As such, the project site is exposed to little or no risk from landslides, impacts would be less than significant, and mitigation is not required.

b) Result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. The construction and grading associated with site preparation and construction of the project would remove existing orchard vegetation and hardscape. Most of the other project areas adjacent to the roadways and within the roadway shoulders contain very limited vegetative cover to impede runoff. Nonetheless, construction activities would temporarily increase the exposure of soils to water and wind erosion. Dust Control Measures mentioned in Chapter 3, Air Quality, which include watering of the project site and haul roads, would also help to prevent the loss of topsoil. The potential effects from uncontrolled erosion include impacts on water quality and air quality. Exposed soils that are not properly contained or capped increase the potential for increased airborne dust and increased discharge of sediment and other pollutants into nearby stormwater drainage facilities. Risk associated with erosive soils could be reduced by using appropriate controls during construction and properly re-vegetating exposed areas.

As noted above in Section 3.2 Air Quality, compliance with City of Tracy General Plan Air Quality Element would require the implementation of various dust control measures during site preparation and construction activities. In addition to these measures that would reduce the potential for soil erosion and the loss of topsoil, because the proposed project would disturb more than an acre of land it would be required to obtain a Construction General Permit from the SWRCB. The Construction General Permit would require preparation of a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP would include implementation of BMPs to avoid or minimize adverse water quality impacts from erosion and sedimentation. BMPs fall within the categories of Temporary Soil Stabilization, Temporary Sediment Control, Wind Erosion Control, Tracking Control, Non-Storm Water Management, and Waste Management and Materials Pollution Control.

With these erosion control measures in place, impacts resulting from construction and operational activities would be minimized and project level impacts related to erosion would be less than significant and additional mitigation is not required.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Potentially Significant Unless Mitigation Incorporated. The project site and surround areas are generally flat, which is not anticipated to result in liquefaction, lateral spreading, landslides, or collapse.

Liquefaction also discussed above in *a) iii),* results from the loss of strength during cyclic loading and can occur during ground shaking created by movement on faults. Soils most susceptible to liquefaction are clean, loose, saturated, uniformly graded and fine-grained sands. The City of Tracy General Plan Draft EIR notes that the central portion of the Tracy Planning Area is moderately susceptible to liquefaction. While the proposed project occurs in the southwesterly portion of the planning area, it would nonetheless be implemented in conformance to the objectives, polices, and actions of the General Plan Safety Element. This, in conjunction with the site-specific geotechnical report, which would address potential for liquefaction and include remedies, if needed, such as excavation, mixing, and recompaction of soils, would ensure impacts remain less than significant.

Lateral spreading typically results when ground shaking moves soils toward an area where soil integrity is weak or unsupported, and it typically occurs on the surface of a slope, although it does not occur strictly on steep slopes. Oftentimes, lateral spreading is directly associated with areas susceptible to liquefaction. This potential is considered low because the project site is not adjacent to or in an elevated area that could be affected by spreading. Potential effect would be further reduced by conformance with the goals, polices, and implementation measures from the General Plan Safety element and any recommendations contained in the site-specific geotechnical report.

Collapsible soils undergo a rearrangement of their grains and a lot of cementation, resulting in substantial and rapid settlement under relatively low loads. Collapsible soils occur predominantly at the base of mountain ranges, where Holocene-age alluvial fan and wash sediments have been deposited during rapid run-off events. Differential settlement of structures typically occurs when heavily irrigated landscape areas are near a building foundation. Examples of common problems associated with collapsible soils include tilting floors, cracking or separation in structures, sagging floors, and nonfunctional windows and doors. Soil data from the NRCS Web Soil Survey suggests the project site is underlain by Zacharias clay loam (0 to 2 percent slopes) and based on the characteristics of the soils (NRCS, 2022) and its location approximately 10 miles east of the base of the coast range, would have a low potential for collapsible soils on the project site. Therefore, implementation of the proposed project would result in a less than significant impact in this regard (City of Tracy, 2020).

Land subsidence is the gradual settling or sinking of an area with little or no horizontal motion due to changes taking place underground. It is a natural process, although it can also occur as a result of human activities. Common causes of land subsidence from human activity including pumping water, oil, and gas, and other mining activities from underground reservoirs leaving voids that can be collapse when exposed to seismic activity. However, subsidence is not anticipated at the project site as there are no active oil or gas well in proximity to the project. The nearest well to the project

site is located approximately 0.75 miles to the northwest and is capped (Calgem, 2022). In addition, the proposed project largely overlays an existing roadway and there are no water wells within the alignment. Lastly, as previously discussed, conformance with General Plan policies goals objectives and implementation measures, as well as conformance with the requirements set forth in the site-specific geotechnical report, required in **MM GEO-1,** would ensure these impacts are less than significant.

As previously mentioned, the project site does not overlay any active faults and is not in a liquefaction zone. Therefore, the potential for lateral spreading, subsidence, liquefaction, or collapse is low. To further prevent the above adverse effects all project components would be constructed in accordance with applicable City goals and policies as detailed in the General Plan and implementation of any recommendation contained in the site-specific geotechnical report. In addition, all construction plans and related geotechnical plans and studies would be reviewed by the City further ensuring compliance with all building construction standards. Compliance with all construction standards would reduce the potential for an off-site landslide, lateral spreading, subsidence, liquefaction or collapse and reduce the impacts to a less than significant level.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Potentially Significant Unless Mitigation Incorporated. Expansive soils are those that undergo volume changes as moisture content fluctuates; swelling substantially when wet or shrinking when dry. Soil expansion can damage structures by cracking foundations, causing settlement and distorting structural elements. Expansion is a typical characteristic of clay-type soils. Expansive soils shrink and swell in volume during changes in moisture content, such as a result of seasonal rain events, and can cause damage to foundations, concrete slabs, roadway improvements, and pavement sections. Soil expansion is dependent on many factors. The more clayey, critically expansive surface soil and fill materials will be subjected to volume changes during seasonal fluctuations in moisture content. There are no expansive (i.e. shrink-swell) soils within the project site. According to the USDA Web Soil survey, the project site contains approximately 85% Zacharias and similar soils with 15% minor components (USDA, 2022). Given the soils identified on site, adherence to applicable Federal, State, and Local rules and regulations, and compliance with **MM GEO-1** impacts would be a less than significant impact.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Less Than Significant Impact. The proposed project is a roadway improvements project and does not include any habitable structures that would require wastewater disposal. The proposed project does not include any elements of an alternative wastewater disposal system.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Unless Mitigation Incorporated. There are no known paleontological resources located in project area. However, development of the proposed project could result in

the discovery and disturbance of previously unknown or undiscovered paleontological resources. While fossils are not expected to be discovered during construction, it is possible that significant fossils could be discovered during excavation activities.

Even in areas with a low likelihood of occurrence. Fossils encountered during excavation could be inadvertently damaged. If a unique paleontological resource is discovered, the impact to the resource could be substantial. **MM GEO-2** would require that a qualified paleontologist monitor grading and excavation activities, and a paleontologist be notified if paleontological resources are found. If any scientifically important large fossil remains are uncovered, the paleontologist would have the authority to divert heavy equipment away from the fossil site. With implementation of **MM GEO-2** and consistency with City ordinances, policies and goals, impacts associated with paleontological resources would be less than significant.

MM GEO-2: **Paleontological Resources.** If paleontological resources are discovered during the course of construction, work shall immediately halt within 50 feet of the discovery and the City of Tracy shall be notified. A qualified paleontologist shall be retained to determine the significance of the discovery. If the paleontological resource is considered significant, a recovery and preservation plan shall be developed by the qualified paleontologist and the resource shall be donated to a local agency, State University, or other applicable institution, where the resources can be studies, curated, and displayed for public education purposes if applicable. and implemented.

Cumulative Impacts

Geology and soil-related impacts are generally site-specific and are determined by a particular site's soil characteristics, topography, and proposed land uses. Cumulative effects related to geology resulting from the implementation of proposed improvements would not expose more persons and property to a substantial increase in the potential to be affected by impacts due to seismic activity and construction of the project would not exacerbate existing geotechnical hazards. Long-term impacts related to geology include the exposure of people to the potential for seismically induced ground shaking. While implementation of the proposed project, taken in conjunction with other past present and reasonably foreseeable projects, the proposed project would not increase the number of people and structures subject to a seismic event or increase the potential for such events to occur. In addition, seismic and geologic significance are considered on a project-by-project basis typically through the preparation of a design-level geotechnical studies, and conformance to applicable policies related to design and conformance to applicable building codes. As such exposures are anticipated to be minimized through strict engineering guidelines that provide protection against known geologic hazards and potential geologic and soil related impacts. Thus, the proposed project would not contribute to a cumulatively considerable geologic and/or soils impacts and impacts would be less than significant.

GREENHOUSE GAS EMISSIONS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
8. GREENHOUSE GAS EMISSIONS. Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			**X**	
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			**X**	

REGULATORY SETTING

Federal

To date, national standards have not been established for nationwide greenhouse gas (GHG) reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding. The U.S. Environmental Protection Agency's (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in Massachusetts v. EPA (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the EPA finalized an

endangerment finding in December 2009. Based on scientific evidence, it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the EPA's assessment of the scientific evidence that form the basis for the EPA's regulatory actions.

Federal Vehicle Standards. In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the EPA is currently proposing to freeze the vehicle fuel efficiency standards at their planned 2020 level (37 mpg), canceling any future strengthening (currently 54.5 mpg by 2026).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baseline.

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program.

In 2018, the President and the EPA stated their intent to halt various federal regulatory activities to reduce GHG emission, including the phase two program. California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives. On September 27, 2019, the EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.) The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March

31, 2020, the EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration has repealed SAFE Rule Part One, effective January 28, 2022 and is reconsidering Part Two pursuant to Presidential Executive Order 13390 issued on January 20, 2021.

State

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2e in the world and produced 440 million gross metric tons of CO_2e in 2015. In the state, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark AB 32 California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major legislation related to GHG emissions reduction.

Assembly Bill 32 (California Global Warming Solutions Act of 2006). AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

CARB Scoping Plan. CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual"). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the state's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines the adopted role of a cap-and-trade program. Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan include:

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
- Achieving a statewide renewables energy mix of 33 percent by 2020.

- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).
- Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gasses with high global warming potential, and a fee to fund the administrative costs of California's long-term commitment to AB 32 implementation.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated considering current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated state-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarizes the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identifies the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32. By 2016, California had reduced GHG emissions below 1990 levels, achieving AB 32's 2020 goal four years ahead of schedule.

In January 2017, CARB released the 2017 Climate Change Scoping Plan Update (Second Update) for public review and comment (CARB, 2017). The Second Update sets forth CARB's strategy for achieving the state's 2030 GHG target as established in Senate Bill (SB) 32 (discussed below). The Second Update was approved by CARB's Governing Board on December 14, 2017.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit. Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017, CARB adopted a second update to the Scoping Plan (CARB, 2017b). The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping Plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support the Clean Power Plan and other Federal actions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008). Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies. The applicable sustainable community strategy in the Bay Area is Plan Bay Area 2040.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards). AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards). SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the state. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078 and SBX1-2 (Renewable Electricity Standards). SB 1078 required California to generate 20 percent of its electricity from renewable energy by 2017. This goal was accelerated with SB 107, which changed the due date to 2010 instead of 2017. On November 17, 2008, Executive Order S-14-08 established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SB X1-2 codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015). Signed into law on October 7, 2015, SB 350 implements the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the

procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 45 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms). Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans). Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases). Signed into Law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the state's tone and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce greenhouse gas emissions to 2000 levels.
- By 2020, reduce greenhouse gas emissions to 1990 levels.
- By 2050, reduce greenhouse gas emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S-01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the

Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the state's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the state come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewable Portfolio Standard (RPS) to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e ($MMTCO_2e$). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the state's climate adaptation plan to be updated every three years and for the state to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Regional

San Joaquin Valley Air Basin Air Quality Management District Thresholds

The proposed project lies within the northern portion of the San Joaquin Valley Air Basin (SJVAB). The San Joaquin Valley Air Pollution Control District (SJVAPCD) has jurisdiction over most air quality matters in the SJVAB and is tasked with implementing programs and regulations required by the federal and State Clean

Air Acts. According to the SJVAPCD, impacts are less than significant if a project complies with adopted statewide, regional, or local plan for reduction or mitigation of GHG emissions.

Under CEQA, the SJVAPCD is a commenting responsible agency on air quality within its jurisdiction or impacting its jurisdiction. The SJVAPCD reviews projects to ensure that they would: (1) support the primary goals of the latest Air Quality Plan; (2) include applicable control measures from the Air Quality Plan; and (3) not disrupt or hinder implementation of any Air Quality Plan control measures.

Local

City of Tracy Sustainability Action Plan

The City of Trace adopted a Sustainability Action Plan (SAP) on February 1, 2011. The SAP, consistent with the recommendations of the CARB Scoping Plan, establishes a GHG reduction goal of 29 percent of community and municipal GHG emissions from 2020 business-as-usual (BAU) projected levels. The SAP provides a long-range strategy to achieve sustainability in the sectors of GHG emissions, energy, transportation and land use, solid waste, water, agriculture and open space, biological resources, air quality, public health, and economic development. The SAP reduction targets are based on the following objectives:

- 20 percent increase in the percentage of City employees who participate in travel demand management programs from 2006 levels.
- 20 percent increase in the percentage of non-City employees who participate in travel demand management programs from 2006 levels.
- 20 percent reduction in the municipal vehicle miles traveled (VMT) from 2006 levels.
- 20 percent reduction in the community VMT per capita from 2006 levels.

City of Tracy Municipal Code

The City's Municipal Code includes the following regulations that would reduce GHG emissions from future development:

- Green Building Standards Code (Chapter 9.14)
- Energy Code (Chapter 9.64)
- Water Management (Chapter 11.28)

City of Tracy General Plan

The General Plan includes the following GHG reduction policies, which are applicable to the project.

Objective LU-9.1 Undertake measures to reduce greenhouse gas emissions and improve the sustainability of actions by City government, residents and businesses in Tract.

P1: The City shall maintain, implement and monitor the Sustainability Action Plan, and adjust the Sustainability Action Plan as needed based on monitoring results and as funding becomes available.

Objective CC-2 Maximize direct pedestrian, bicycle and vehicle connections in the city.

Objective CC-2.2 Provide connections that reinforce the role and function of the Building Blocks within the City.

P1: The Downtown and Village Centers shall have direct pedestrian, bicycle and vehicular connections to all Neighborhoods or development projects within an Employment Area.

P2: Neighborhoods shall have direct pedestrian, bicycle and vehicular connections to their Focal Points and Village Center, compatible with the character, circulation network, and general configuration of the neighborhoods.

P3: As existing areas redevelop and change over time, new and increased connections to Focal Points and retail areas shall be developed.

P5: Streets shall be continuous within and between Neighborhoods, including those that are built by different developers or builders.

Objective CIR-1.2 Provide a high level of street connectivity.

P1: The City shall ensure that the street system results in a high level of connectivity, especially between residences and common local destinations, such as schools, Village Centers, retail areas and parks. The standard for roadway (vehicular) connectivity is defined as appropriate spacing of arterials and collectors and local roads as detailed above in Section B of this Element "Roadway Classifications and Standards."

P2: The City shall implement a connected street pattern with multiple route options for vehicles, bikes and pedestrians.

P3: New development shall be designed to provide vehicular, bicycle and pedestrian connections with adjacent developments.

Objectives CIR-1.8: Minimize transportation-related energy use and impacts on the environment.

P1: Transportation projects shall avoid disrupting sensitive environmental resources.

P2: When possible, road construction and repair projects shall use sustainable materials.

P3: The City shall encourage the use of non-motorized transportation and low-emission vehicles.

Objective CIR-3.1: Achieve a comprehensive system of city-wide bikeways and pedestrian facilities.

P1: The City shall incorporate appropriate bicycle and pedestrian facilities on all roadways constructed by the City, Class I to the extent feasible.

P2: To the extent possible, the City shall separate vehicular from bicycle and pedestrian traffic on higher-speed and higher-volume roadways through the use of off-street bicycle and pedestrian facilities.

P3: The City may separate bicycle from pedestrian users on high usage bicycle and pedestrian paths.

P4: The City's bicycle and pedestrian system shall have a high level of connectivity, especially between residences and common local destinations, such as schools, shopping and parks. A higher level of bicycle and pedestrian connectivity is defined as a shorter or similar distance to common destinations for bicycles and pedestrians compared to distances for vehicles.

Objective AQ-1.1: Improve air quality and reduce greenhouse gas emissions through land use planning decisions.

Objective AQ-1.2: Promote development that minimizes air pollutant and greenhouse gas emissions and their impact on sensitive receptors as a result of indirect and stationary sources.

P1. The City shall assess air quality impacts using the latest version of the CEQA Guidelines and guidelines prepared by the San Joaquin Valley Air Pollution Control District.

P2. The City shall assess through the CEQA process any air quality impacts of development projects that may be insignificant by themselves, but cumulatively significant.

P3. Developers shall implement best management practices to reduce air pollutant emissions associated with the construction and operation of development projects.

P13. Dust control measures consistent with San Joaquin Valley Air Pollution Control District rules shall be required as a condition of approval for subdivision maps, site plans, and all grading permits.

P14. Developments that significantly impact air quality shall only be approved if all feasible mitigation measures to avoid, minimize or offset the impact are implemented.

Objective AQ-1.3: Provide a diverse and efficient transportation system that minimizes air pollutant and greenhouse gas emissions.

P1. The City shall continue to work with the San Joaquin Council of Governments on regional transportation solutions.

THRESHOLDS

According to the SJVAPCD, impacts are less than significant if a project complies with adopted statewide, regional, or local plan for reduction or mitigation of GHG emissions. The vast majority of individual projects do not generate sufficient GHG emissions to create a project-specific impact through a direct influence on climate change; therefore, the issue of climate change typically involves an analysis of whether a project's contribution towards an impact is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects (CEQA Guidelines, Section 15355).

The SJVAPCD has evaluated different approaches for estimating impacts and summarizing potential GHG emission reduction measures. The SJVAPCD staff has concluded that "existing science is inadequate to support quantification of impacts that project specific GHG emissions have on global climatic change." This is readily understood when one considers that global climatic change is the result of the sum total of

GHG emissions, both man-made and natural that occurred in the past; that is occurring now; and will occur in the future. The effects of project specific GHG emissions are cumulative, and unless reduced or mitigated, their incremental contribution to global climatic change could be considered significant.

The *Final Draft Guidance for Assessing and Mitigating Air Quality Impacts* (SJVAPCD, 2015) provides an approach to assessing a project's impacts on greenhouse gas emissions by evaluating the project's emissions to the "reduction targets" established in ARB's AB 32 Scoping Plan. For instance, the SJVACD's guidance recommends that projects should demonstrate that "*project specific GHG emissions would be reduced or mitigated by at least 29%, compared to Business as Usual (BAU), including GHG emission reductions achieved since the 2002-2004 baseline period, consistent with GHG emission reduction targets established in ARB's AB 32 Scoping Plan. Projects achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG*."

Subsequent to the SJVAPCD's approval of the *Final Draft Guidance for Assessing and Mitigating Air Quality Impacts* (SJVAPCD 2015), the California Supreme Court issued an opinion that affects the conclusions that should/should not be drawn from a GHG emissions analysis that is based on consistency with the AB 32 Scoping Plan. More specifically, in *Center for Biological Diversity v. California Department of Fish and Wildlife*, the Court ruled that showing a "project-level reduction" that meets or exceeds the Scoping Plan's overall statewide GHG reduction goal is not necessarily sufficient to show that the project's GHG impacts will be adequately mitigated: "*the Scoping Plan nowhere related that statewide level of reduction effort to the percentage of reduction that would or should be required from individual projects...*" According to the Court, the lead agency cannot simply assume that the overall level of effort required to achieve the statewide goal for emissions reductions will suffice for a specific project.

Given this Court decision, reliance on a 29 percent GHG emissions reduction from projected BAU levels compared to a project's estimated 2020 levels as recommended in the SJVAPCD's guidance documents will not be the basis for an impact conclusion in this EIR. Given that the SJVAPCD staff has concluded that "*existing science is inadequate to support quantification of impacts that project specific GHG emissions have on global climatic change*," this analysis instead relies on a qualitative approach to evaluate the project's GHG impacts. Specifically, the analysis relies on an assessment of the proposed project for consistency with relevant planning documents and relevant laws is provided herein.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impact.

Short-Term Construction Greenhouse Gas Emissions

Construction of the project would result in direct emissions of CO_2, N_2O, and CH_4 from the operation of construction equipment and the transport of materials and construction workers to and from the project site. SJVAPCD does not have a threshold for construction GHG emissions, which are one-time, short-term emissions and therefore would not significantly contribute to long-term cumulative GHG emissions impacts of the proposed project. However, the SJVAPCD advises that construction GHG should be disclosed and a determination on the significance of construction

GHG emissions in relation to meeting AB 32 GHG reduction goals should be made. Total GHG emissions generated during all phases of construction were combined and are presented in *Table 4-5: Construction Greenhouse Gas Emissions*. The RCEM outputs are contained within the Appendix A.

Table 4-5: Construction Greenhouse Gas Emissions

Year	$MTCO_2e$[1]
2024	164.82
Total	164.82
Amortized	5.49
$MTCO_2e$ = metric tons of carbon dioxide equivalent. Source: SMAQMD, Road Construction Emissions Model version 9.0.0. Refer to Appendix A for model outputs.	

As shown in *Table 4-5*, project construction-related activities would generate approximately 164.82 $MTCO_2e$ of GHG emissions over the course of construction. One-time, short-term construction GHG emissions are typically summed and amortized over the project's lifetime (assumed to be 30 years). The amortized project emissions would be approximately 5.49 $MTCO_2e$ per year. Once construction is complete, the generation of construction-related GHG emissions would cease.

Long-Term Operational Greenhouse Gas Emissions

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated.

As discussed in impact b), below, the proposed development would be constructed in compliance with the City's SAP. The proposed project, therefore, would be consistent with the City's GHG reduction measures and General Plan and would have a less than significant GHG emissions impact.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant Impact.

City of Tracy Sustainability Action Plan Consistency

The City's SAP establishes a GHG emission reduction target that is based on SJVACPD threshold of a 29 percent reduction from BAU emissions. The City's target was also developed following a review of sustainability targets set by other entities, such as the Attorney General's Office, and have been refined iteratively and concurrently with the sustainability measures. The proposed project's consistency with applicable SAP measures is assessed in *Table 4-6: City of Tracy SAP Consistency* below. As shown in *Table 4-6*, the project would be consistent with applicable SAP measures and would not hinger its implementation or effectiveness. As the project would be consistent with the City's SAP, impacts in this regard would be less than significant.

Table 4-6: City of Tracy SAP Consistency

SAP Measures	Project Consistency
E-7: Energy Efficient Retrofits for City Street Lights. Retrofit City street lights to LED or induction lighting.	**Consistent.** The proposed project would conform to City of Tracy standards for street lighting that establish requirements for the use of LED lighting.
T-5.e: Smart Growth, Urban Design and Planning. Add to the Transportation Master Plan a program to close sidewalk gaps on key routes within the developed city, contingent on grant funding.	**Consistent.** New sidewalk and curb and gutter would be installed along Corral Hollow Road north of Linne Road to connect to the existing pedestrian network. In addition, a traffic signal and crosswalks would be installed to further improve the pedestrian network.
SW-1: Diversion of Construction Waste from Landfills. Amend the Municipal Code to require at least 50 percent diversion (i.,e. reuse or recycling) of non-hazardous construction waste from disposal.	**Consistent.** The project would not conflict with implementation of this measure. The project is required to achieve the recycling mandates via compliance with the CALGreen code.
Source: City of Tracy, *Sustainability Action Plan*, February 1, 2011.	

Cumulative Impacts

It is generally the case that an individual project of the project's size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of project-related GHG emissions would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. In addition, the project as well as other cumulative related projects, would be subject to all applicable regulatory requirements, which would further reduce GHG emissions. As discussed in GHG-2 discussion above, the project would be consistent with the City's SAP. Thus, the project would not conflict with any GHG reduction plan. Therefore, the project's cumulative contribution of GHG emissions would be less than significant and the project's cumulative GHG impacts would also be less than cumulatively considerable.

HAZARDS AND HAZARDOUS MATERIALS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
9. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			**X**	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?		**X**		
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			**X**	
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?			**X**	
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?			**X**	
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			**X**	
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?			**X**	

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. Construction equipment and construction activities include the use paints and solvents and other petroleum-based products, typically used for on-site construction

equipment and that would be used for the proposed project. These materials would be used during site preparation, removal activities, grading, paving of the new roadways, installation of curb and gutter, utility installation and other construction activities. Heavy construction equipment would be used for excavation and removals of existing hardscape. The use of these materials and equipment is typical for this type of construction and typically do not typically represent a substantial risk when property used. However, if an accident or a release does occur, a spill of these materials could pose a threat to human health and safety and could contaminate water, species habitat, and/or agricultural resources.

Any potentially hazardous materials such as fuels, greases, lubricants, solvents, or other materials would be used during construction of the proposed project would be handled on-site in accordance with applicable recommendation and safe handling requirements. The use or handling of these potentially hazardous materials would be short-term only during the construction phase of proposed project. The transport, removal, and disposal of hazardous materials on the project site would be conducted by a permitted and licensed service provider consistent with federal, state, and local requirements including the EPA, the California Department of Toxic Substances Control (DTSC), the California Occupational Safety and Health Administration (Cal/OSHA), Caltrans, the Resource Conservation and Recovery Act, and the City of Tracy fire department through the Conditionally Exempt Small Quantity Generator (CESQG) Program. With the compliance with local, state, and federal regulations short-term construction impacts associated with the handling, transport, use, and disposal of hazardous materials would be less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Potentially Significant Unless Mitigation Incorporated. As previously mentioned, the project site is within an existing roadway and previously disturbed undeveloped land and does not contain any known areas that have been reported to have experienced any hazardous materials incidents (see a) above and c), below.) for additional discussion.

The proposed project would occur within an existing roadway, but portions of the adjacent parcels that would be used and acquired are within existing agricultural, industrial, and railroad road right of way. In addition, the proposed project also would make minor modifications to the area containing a UPRR crossing of Corral Hollow Road within the northerly portion of the improvements. As search of both the Department of Toxic Substances Control (DTSC) Envirostor and California Water Boards Geotracker databases did not show any known hazards or previous hazardous releases within the project site (DTSC, 2022, and Waterboards, 2022). Nonetheless, there is the potential that unknown hazards exist below the ground surface and could be disturbed during construction activities. If such areas exist, and workers are exposed to substances, a risk to human health and safety could result. To minimize these effects, if materials are located during construction, work would cease in the area and the construction contractor would notify the City, City Fire Department, and DTSC, as applicable.

The use, clean up, and disposal of any potentially hazardous construction materials encountered during construction will be managed according to standard procedures to protect air quality, water

quality, and the environment as per state laws and is not expected to result in a reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. For example, in such event the project would be subject to the San Joaquin County Department of Environmental Health's Hazardous Materials Business Plan Program, which aims to protect the public health and safety and the environment by establishing business and area plans relating to the handling and release or threatened release of hazardous materials. If materials are located, the area would be evaluated and a clean-up plan would be implemented prior to resumption of construction activities in the vicinity. Mitigation Measure MM HAZ -1, would be implemented and further ensure impacts are less than significant.

Operation of the proposed project would not result in a hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The proposed project includes roadway widening, infrastructure, and associated improvements. The proposed project does not include any uses that would result in the generation or disposal of hazardous materials. While the roadway could be used by vehicles transporting materials, these vehicles would already be using the existing roadways and the project would not substantially increase the use of the roads for such activities. In addition, transport of hazardous materials would be done in accordance with regulations pertaining to their transport.

The needed grading is expected to be a balanced (even quantities of cut and fill) requiring no imported soil to backfill excavated areas. This would eliminate the potential risk of importing potentially contaminated soils to the project site. While the proposed project is not considered a sensitive land use, if imported fill materials are used, they the procedures outlined in the DTSC Information Advisory Clean Imported Material Fact Sheet would be followed. This would minimize the potential of introducing material that may result in a potential risk to human health or the environment at the project site. It should be noted, that fill material from undesirable commercial or industrial sites (e.g. former gasoline service stations, manufacturing facilities, etc.) would not be used. Fill materials would be sourced from nonindustrial areas, and not from sites undergoing an environmental cleanup per DTSC guidance.

A portion of the project site, the approximately 1.6 acres that would contain roadway improvements and the retention basin, and approximately 0.77 acres used for a temporary easement area are adjacent to the westerly alignment of Corral Hollow Road and in an area presently used as an orchard. DTSC has provided guidance related to the use of former agricultural land due the potential for such sites (used after 1950), to have used organochlorides for pest control. As noted in the DTSC Interim Guidance for Sampling Agricultural Properties, the guidance applies to proposed new and/or expanded school sites or other projects where a new land use could result in increased human exposure, especially residential use. The proposed project includes roadway improvements and does not include any habitable structures that would result in long term exposure. Future drivers that would use the roadway would be extremely transitory through the area and would not be exposed to any of the soils.

Thus, compliance with federal, state, and local regulations, the incorporation of the proposed project design features, and **MM HAZ-1**, belove, would reduce impacts associated with the

handling, transport, use, and disposal of hazardous materials and the release of hazardous materials into the environment would be less than significant

MM HAZ-1: In the event that hazardous materials are encountered during construction, the area will be evaluated by a qualified professional and a Soils management plan (SMP) shall be submitted and approved by the City/County of San Joaquin County Department of Environmental Health. The SMP shall require identification of the materials and shall establish management practices for the handling and disposal of the materials. Work shall not resume until the materials are removed and work is reauthorized by the City.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less Than Significant Impact. The proposed project would not create hazardous emissions or handle hazardous materials or increase the handling of materials or waste. The nearest school to the project site is Anthony Traina Elementary School approximately 0.5 miles to the northwest. There are no schools within 0.25 miles of the project site and as noted above the project would be in compliance with federal, state, and local regulations. As such, all preventive measures would be in place to limit the hazardous emissions and waste in such a way that would not impact the neighboring school. As such impacts are expected to be less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less than Significant Impact. There are no superfund sites or hazardous waste and substances sites (Cortese List) within the project site boundaries (DTSC, 2022a). Additionally, there are no known hazardous materials sites within the projects boundaries as identified on the State of California Geotracker Map (RWQCB, 2022) or on the DTSC Geotracker website (DTSC, 2022b). Therefore, a less than significant impact associated with hazardous materials sites would occur.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less than Significant Impact. The proposed project is located within the airport land use area for the Tracy Municipal Airport, which ls located approximately 0.5 miles southwest of the project site. The Tracy Municipal airport is owned and operated by the City of Tracy and is a general aviation airport that provides a range of aviation services jet fuel sales, and hangar and tie down rentals. None of the project areas are within Zone 1 – (Runway Protection Zone), but portions of the project site are located in Compatibility Zones 2 (Inner Approach/Departure Zone), and 3 (Inner Turning Zone), (San Joaquin County, 2018).

According to the Airport Land Use Compatibility Plan, certain actions, such as amendments to the general plan within the airport influence areas, changes to a master plan in the airport influence areas, etc., require mandatory ALUC review. The ALUC also lists 13 other actions that would render

a project potentially subject to ALUC review. Of the 13 project types, two would be potentially applicable to the proposed project and are shown below. :

- Proposals for new development (including buildings, antennas, and other structures) having a height of more than:
  - 35 feet within the Runway Project Zone or Inner Approach/Departure Zone;
  - 70 feet within Extended Approach/Departure Zone; or
  - 150 feet within Sideline Safety or Traffic Pattern Zone.
- Any project having the potential to create electrical or visual hazards to aircraft in flight, including"
  - Electrical interference with radio communications or navigational signals;
  - Lighting which could be mistaken for airport lighting;
  - Glare in the eyes of pilots using the airport; and
  - Impaired Visibility near the airport.

Although the project is not anticipated to use any signal masts of new streetlights greater than 35 feet in height that could inhibit the flight path of aircraft, and although the new lighting is not anticipated to be mistaken for airport lighting, due to the project's location, this document including a description of all proposed lighting and lighting mounts will be provided to the ALUC for their review. If the ALUC provides comments or suggestions needed to minimize potential conflicts, it would be included to the project. This coordination with the ALUC would ensure impacts remain less than significant.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The project site currently connects to an existing network of City streets. The proposed roadway widening and circulation improvements would allow for greater emergency access relative to existing conditions. During construction minor interruptions to service could occur, but full road closures are not anticipated and emergency services both for routine and emergency responses and evaluation would remain usable. Thus, the project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan and impacts would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less Than Significant Impact. The project site is not located within an area identified as having a high wildland fire potential. The project site is located in proximity to highly disturbed areas and not adjacent to any wildlands. To the west the project site would occur within a portion of an orchard but this area is not prone to experiencing wildfire. In 2008 CalFire determined that the County has no Very High Fire Hazard Severity Zones (VHFHSZ) within Local Responsibility Area (LRA) and there is no map showing VHFHSZ. Thus, the proposed project is not located in such an area and the proposed project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. A Less Than Significant impact would occur.

Cumulative Impacts

The incremental effects of the proposed project related to hazards and hazardous materials, if any, are anticipated to be minimal, and any effects would be site-specific. The proposed project is also not within an area classified as a VHFHSZ. Therefore, the proposed project would not result in incremental effects to hazards or hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed project would not result in cumulatively considerable impacts to or from hazards or hazardous materials.

HYDROLOGY AND WATER QUALITY

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
10. HYDROLOGY AND WATER QUALITY. Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?			**X**	
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?			**X**	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i) Result in substantial erosion or siltation on- or off-site?			**X**	
ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?			**X**	
iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?		**X**		
iv) Impede or redirect flood flows?			**X**	
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?			**X**	
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?			**X**	

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant Impact. The project site falls within the San Joaquin Valley Groundwater Basin. There are no surface waters or wetlands located on the project site per the National Wetlands Inventory (USFWS, 2022). The nearest surface water is the Delta-Mendota Canal which is located approximately 150 south of the southerly boundary of the project site. Thus, the proposed project does not contain any direct drainage connectivity to Waters of the US. During the project grading activities, trenching for utilities, and other standard ground-disturbing activities topsoil would be exposed. After grading and prior to overlaying the ground surface with the new roadway and impervious surfaces, the potential exists for wind and water erosion to discharge sediment and/or urban pollutants into stormwater runoff. If not properly controlled, this could adversely affect water quality.

In order to ensure that stormwater runoff from the project site does not adversely increase pollutant levels in adjacent surface waters and stormwater conveyance infrastructure, BMPs would be implemented. BMPs would be used to reduce the potential for pollutants in stormwater runoff from leaving the site. BMPs could include, but are not limited to, tracking controls, perimeter sediment controls, drain inlet protection, wind erosion/dust controls, and waste management control. The BMP's would be implemented in accordance with a site-specific Storm Water Pollution Prevention Plan (SWPPP), which would be developed to comply with the National Pollution Discharge Elimination System (NPDES).

The project also includes an approximate 0.35-acre retention basin. The retention basin would contain the surface water runoff and allow sediments to settle out prior to discharge of water. This project element in conjunction with the above compliance with and completion of NPEDS permit, SWPPP, BMPs, and conformance to applicable Federal, State, and Local regulations, the proposed project would have a less than significant impact related to water quality and water discharge requirements with conformance to the listed regulations. Additional mitigation would not be required.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less Than Significant Impact. The proposed project consists of roadway improvements and does not include uses such as residential, commercial, or industrial, that would result in a substantial increased the demand for water, including groundwater. During construction, a minimal amount of water would be used for construction and would be needed for activities such as watering bare ground for erosion control. Water, however, is anticipated to be supplied by existing City water supplies from existing waterlines within Corral Hollow and Linne Road.

In addition, while the proposed project would increase the volume of hardscape, the new areas would not be a substantial of volume such that the potential for groundwater would be significantly reduced. In addition, the proposed project includes a retention basin that would contain stormwater runoff, increase the time to discharge and increase the potential for infiltration and ground water recharge. Thus, impacts from project implementation and operation would be less than significant in this regard.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) Result in substantial erosion or siltation on- or off-site?

Less Than Significant Impact. Implementation of the proposed project would not alter a stream or a river. The existing roadway is a pervious surface and water drains to roadside ditches. The project improvements would increase impervious surfaces and incrementally increase the volume of stormwater runoff. As standard practice, the City requires post-project runoff to be equal to or less than pre-project runoff. The retention basin on the westerly side of Corral Hollow Road would help ensure the proposed project would not substantially increase the rate or amount of surface runoff. The retention basin would increase the time of concentration, facilitate recharge, and minimize the potential for flooding that could carry pollutants to off-site areas or other downstream receiving waters. In addition, as discussed in a), above. The proposed project would comply with the NPDES permit and implement a SWPPP with BMPs that would reduce the potential for substantial siltation and erosion.

ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?

Less Than Significant Impact. Related to the volumes of surface runoff, the proposed project would be subject to the requirements contained in the City of Tracy Municipal Code – Stormwater Management and Discharge Control which has the purpose of protecting and promoting the health, safety and general welfare of the citizens of the City by controlling non-stormwater discharges to the stormwater conveyance system. These requirements assist with protection of waterbodies through compliance with the Clean Water Act, Porter Cologne Water Quality Control Act, and NPDES permitting process.

To ensure the drainage plans are sufficient, the proposed project would be designed with a site-specific storm drainage plan and improvements would be made consistent with the overall storm drainage infrastructure approach presented in the 2012 City of Tracy Citywide Storm Drainage Master Plan. Prior to project approval, the City of Tracy Development Services Department and Utilities Department would review the storm-water improvement plans to ensure they would be adequate infrastructure capacity to collect and direct stormwater runoff to the conveyance system and to downstream areas such that flooding would not occur on-site or off-site. In addition, as discussed above, the project includes a retention basin on the westerly side of Corral Hollow Road that would contain water from storm events. Incorporation of these project design measures would ensure impacts are less than significant.

iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Potentially Significant Unless Mitigation Incorporated. To further reduce the potential for effect related to flooding and water runoff, the project also would include a SWPPP with BMPs to reduce

the potential for pollutants carried by stormwater from leaving the site and adversely affect downstream receiving water. The BMPs would reduce the volumes of disturbed soils, erosion, sediment, and pollutants from roadways to the extent feasible, to make their way into downstream waters. BMP's during both construction, such as the use of haybales, straw waddles, revegetation/hydroseeding, etc., and operations, such as the use of marked storm drains, filter socks, in drain screening media, etc., would be used during the two phases of the project. Mitigation Measure **MM HYD-1** would be implemented and would require the applicant to complete and coordinate a detailed storm drainage infrastructure plan with the City for review and approval. **MM HYD-1** would require a storm drainage plan to be designed and engineered to ensure that the post-project runoff is equal to or less than pre-project runoff and in on- off-site flooding impacts.

MM HYD-1: The proposed project's storm drainage infrastructure plan shall, to the satisfaction of the City engineer demonstrate adequate infrastructure capacity to collect and direct all stormwater generated on the project site to proposed stormwater conveyance system and demonstrate that the project will not result in-on or off-site flooding impacts. If the City engineer determines that the proposed stormwater drainage system would not be adequate, comments would be provided, and amendments to the plans shall be made to the engineer's satisfaction.

iv) Impede or redirect flood flows?

Less Than Significant Impact. The project site and surrounding areas are mapped in the San Joaquin County Flood Zone Viewer. The project area and surrounding vicinity are mapped within a Zone X. Zone X is defined as, "Areas determined to be outside the 0.2% annual chance (500-year) floodplain. The nearest mapped flood zone is approximately 1.0 miles to the southwest, south of the Tracy Boulevard crossing with the Mendota Canal. Thus, the proposed project located in an area with reduced flood risk and the proposed project would not impede or redirect flood flows. Impacts would be less than significant and mitigation is not required.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Less Than Significant Impact. The proposed project is located approximately 56 miles inland from the Pacific Ocean. As such, the potential for the project site to be inundated by a tsunami is remote. No steep slopes are located in the vicinity proposed project; therefore, the risk of mudflow is negligible. There are no adjacent or nearby contained bodies of water, except the Delta Mendota Canal, that would be affected by seiche or that could result in impacts to the project site. Impacts would be less than significant in this regard and mitigation is not required.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. As previously mentioned, the proposed project is within the San Joaquin Valley Groundwater Basin (SJVGWB). The SJVGWB is within the large San Joaquin River and Tulare Lake Hydrologic Regions. The northern portion of the basin is within the San Joaquin

River Hydrologic Region and consists of nine subbasins. The San Joaquin River Hydrologic Region of the basin covers approximately 5.15 million acres. Groundwater is used extensively in the San Joaquin Valley Groundwater Basin, primarily for agricultural and urban uses. This source accounts for approximately 48% of the groundwater used in the state.

San Joaquin Valley Regional Water Quality Control Board

The major source of recharge within the subbasin is from deep percolation of applied irrigation water and from canals and water storage facilities. Lesser groundwater recharge occurs from percolations from small streams, direct percolation of precipitation, and underflow down stream channels from the east including portions of the Stanislaus and Tuolumne rivers. In 2006, natural recharge to the subbasin was estimated at 86,000 acre-feet annually with an additional 92,000 acre-feet of recharge from applied water annually. Estimated annual extractions include 81,000 acre-feet for urban uses and 145,000 acre-feet for agricultural use. (CVRWQCB, 2006).

Eastern San Joaquin Integrated Regional Water Management Plan

The Eastern San Joaquin Integrated Regional Water Management Plan (IRWMP) defines and integrates key water management strategies to establish protocols and courses of action to implement the Eastern San Joaquin Integrated Conjunctive Use Program. The IRWMP was originally prepared in 2007, and updated in 2014, 2016, and most recently in 2020. Groundwater sustainability within the basin is based on 2014 state legislation enacted by the Sustainable Groundwater Management Act (SGMA) which was in response to overdraft conditions. Sustainability is generally defined as long-term reliability of the groundwater supply and the absence of undesirable result. Although the proposed project and Tracy is outside the ESJ Groundwater Management Area, Tracy receives treated Stanislaus River water through the South County Surface Supply Project and will be allocated up to 10,000 af/year.

Tracy Subbasin Groundwater Sustainability Plan

A Groundwater Sustainability Plan is being developed for the Tracy area. The GSA's have adopted the Final Tracy Subbasin Groundwater Sustainability Plan (GSP), which will be submitted to the California Department of Water Resources (DWR) who has up to two years to review. Prior to final approval the GSA will prepare an Annual Report for the subbasin. The Annual Report is due to the DWR by April 1, 2022 and every year thereafter. The GSAs will also continue to coordinate to monitor conditions in the Subbasin, implement projects and actions to manage the sustainability of the groundwater resources, and update the GSP every five years.

As previously discussed, the proposed project does include the construction of new roadway and hardscapes. While this would reduce the potential for recharge in these specific areas, the reduction would not be substantial. In addition, runoff from these areas would be conducted off-site to the stormwater drainage facilities which would enable ground water infiltration. In addition, the proposed project includes a retention basin which would contain stormwater run-off providing an opportunity for the water to infiltrate and recharge the aquifer. Lastly, the proposed project does not propose uses that would require ground water supplies that could reduce water volumes in the aquifer. Thus, the proposed project would not impede ground water recharge or conflict

with an applicable ground water management plan. Impacts would be less than significant and mitigation is not required.

Cumulative Impacts

The potential impacts related to hydrology and storm water runoff are typically site specific and site specific BMPs are implemented at the project level. The analysis above determined that the implementation of the proposed project would not result in significant impacts. In regard to proposed project impacts that would be considered less than significant, and impacts are not anticipated to result in compounded or increased impacts when considered with similar effects from other past, present, and reasonably foreseeable probable future projects. Other projects also would be subject to similar laws and requirements regarding hydrology practices, and would undergo evaluation and the development review process which would ensure their implementation.

Projects would be required to adhere to applicable General Plans goals, policies, and action statements; the City of Tracy's Municipal Zoning Code; the City's Standard Conditions of Approval; and the City's stormwater management guidelines regarding stormwater runoff and infrastructure. In addition, as discussed above, other projects would be required to implement stormwater pollution best management practices during construction and design measures to reduce water quality impacts and comply with the NPDES Municipal Regional Permit. Future developments in the watershed would also be required to comply with the SWRCB and RWQCB. Depending on the size of future projects, they would be required to obtain and comply with all required water quality permits and the Water Quality Control Plan, as needed and prepare and implement SWPPPS, implement construction BMPs, including BMPs to minimize runoff, erosion, and storm water pollution, comply with other applicable requirements. As part of these requirements, projects would be required to implement and maintain source controls, and treatment measures to minimize polluted discharge and prevent increases in runoff flows that could substantially decrease water quality. Conformance to these measures would minimize runoff from those sites and reduce contamination of runoff with pollutants. Therefore, related projects are not expected to cause substantial increases in storm water pollution. With compliance with State and local mandates, cumulative impacts would be less than significant, and project impacts would not be cumulatively considerable.

LAND USE AND PLANNING

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
11. LAND USE AND PLANNING. Would the project:				
a) Physically divide an established community?			**X**	
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?			**X**	

a) Physically divide an established community?

Less Than Significant Impact. The proposed project is located in the southwest portion of the City and would widen two existing roadways, Corral Hollow Road and Linne Road, make improvements within their intersection, improve the railroad crossing, install new signals and install new streetlights. Physical divisions of established communities, while they may be associated with roadway projects, typically occur when a new use is developed between two areas and severs or reduces a connection between the two. Projects that make travel between the areas more difficult can be considered to physically divide a community. The proposed project is surrounding by existing development including industrial, agriculture, and residential. The proposed project would increase the viability and ease of travel between these and other outlying areas by increased the improved roadway capacity and improving the Level of Service (LOS). Thus, the proposed project would not physically divide any surrounding communities and impacts would be less than significant. No mitigation is required.

The proposed project would result in the acquisition, see *Table 2 1: Project Parcels and Acquisition Areas*. This would consist of existing disturbed roadway and railroad shoulder and easement for railroad line. None of the areas within these parcels would affect any existing residential, businesses, or private structures, and railroad operations would not be affected. All improvements within the railroad easement would be made to ensure continued operations and improvements would be engineered so the existing rails, ties, and crossing are not substantially altered and remain functional. All improvements would be made through coordination with UPRR.

APN 025-311-020 and 025-302-112, would occur within an existing disturbed/mowed undeveloped portion of land that contains billboard, fencing, and gravel /dirt driveway used to access the structures on the property. The proposed project would not result in a taking of any of the existing habitable structures, but would result in the removal of some fencing, the billboard, and installation of a new concrete driveway to replace the dirt/gravel entrance. This also would result in the relocation of existing above ground powerlines but these are in existing right-of-way

on the road shoulder. Thus, while the proposed project would result in acquisition and change to the property, continued use and operation of the site would not be substantially inhibited. The property would still have ingress and egress in and to Corral Hollow Road and connectivity to off-site areas would be maintained.

A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. The proposed project would not affect ingress or egress from the project site and would not change any of the existing driveways. Removal of the billboard also would not result in a division. Lastly, due to the large size of the orchard, and relatively small number trees that would be removed, the orchard would remain viable and its use is anticipated to continue.

Thus, the acquisition and use of the listed properties would not be physically divided from other existing uses. Additionally, property owners for both uses would be compensated for the acquired property in accordance with City of Tracy policy. Thus, impacts in this regard would be less than significant and mitigation is not required.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact. The key planning documents that are directly related to, or that establish a framework for the development of the proposed project include the City of Tracy General Plan and Tracy Zoning Ordinance. The proposed project site is on land currently designated Commercial, Heavy Industrial, and Urban Reserve, and existing Linne Rd alignment and ROW in the General Plan and under the Zoning District Limited Industrial (IL), Railroad/UPRR ROW, Agriculture-Urban Reserve (AU). The project would be consistent with the City's zoning and General Plan land use designation upon approval of individual project specific use permits dependent on commercial use. The proposed project would not require any changes to any of the existing land uses that would result in impacts to the environment. In addition, the proposed project would not result in any conflicts with existing land use policies adopted for the purpose of avoiding or mitigation an environmental effect. Therefore, potential impacts are considered less than significant.

Cumulative Impacts

Implementation of the proposed project would not create a significant cumulative impact to the surrounding region since its surrounding area is planned for uses that are consistent with the widening of the roadway, installation of traffic signal, and other intersection improvements to improve existing traffic conditions and serve future planned uses. As a result, no cumulative impacts related to land use and planning would occur.

MINERAL RESOURCES

ENVIRONMENTAL IMPACTS Impact		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
12.	**MINERAL RESOURCES. Would the project:**				
a)	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?			**X**	
b)	Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?			**X**	

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Less Than Significant Impact. As described in the Tracy General Plan EIR, the main mineral resources found in San Joaquin County, and the Tracy Planning Area, are sand and gravel (aggregate). These materials are primarily used for construction materials like asphalt and concrete. According to the California Geological Survey (CGS) evaluation of the quality and quantity of these resources, the most marketable aggregate materials in San Joaquin County are found in three main areas (San Joaquin County, 1992) that includes the following:

- In the Corral Hollow alluvial fan deposits of south Tracy.
- Along the channel and floodplain deposits of the Mokelumne River
- Along the San Joaquin River near Lathrop.

The proposed project is within the Corral Hollow area and would be located adjacent to an existing sand and gravel operation on the southeast corner of the Corral Hollow intersection with Linne Road. The proposed project would improve Linne Road adjacent to the northerly property boundary of the plant operations. The proposed project, however, would not occur within an area being actively mined or in an area in which mining would be expanded. In addition, the proposed project would not inhibit the continued use of the site for mineral extraction or concrete production. Therefore, the project would not result in the loss of availability of a known mineral resource. This impact is considered less than significant.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Less Than Significant Impact. The Surface Mining and Reclamation Act of 1975 (SMARA) requires classification of land into MRZs according to the known or inferred mineral potential of the area. Under SMARA, areas are categorized into MRZs as follows:

MRZ-1 Areas where the available geologic information indicates no significant mineral deposits or a minimal likelihood of significant mineral deposits.

MRZ-2 Areas where the available geologic information indicates that there are significant mineral deposits or that there is a likelihood of significant mineral deposits. However, the significance of the deposit is undetermined.

MRZ-3 Areas where the available geologic information indicates that mineral deposits are inferred to exist; however, the significance of the deposit is undetermined.

MRZ-4 Areas where there is not enough information available to determine the presence or absence of mineral deposits.

In 2012, the California Geological Survey (CGS) published an updated map of aggregate resource sectors within the County and that covered the project site. Portions of project parcels 025-302-012, 024-311-020, and 025-311-029 (to the south, southwest, and southeast of the alignment) are identified as being located within Sectors A-2d and A-2e. According to the published map, these are sectors designated by the state mining and geology board (1988) as containing regionally significant PCC-grade aggregate resources (CGS, 2012).

While these areas are identified, the proposed project would not result in a loss for potential productivity. The area within APN 025-302-012 is presently used for agricultural production, the area within APN 025-311-020 is outside the project footprint, and the area within APN 025-311—029 is outside any area currently used for extraction and would not affect any structures used for processing. As discussed above, the proposed project would not remove any area from potential mineral production and would not inhibit the continued use of the adjacent area for mineral production. Thus, impacts in this regard would be less than significant and mitigation is not required.

Cumulative Impacts

The proposed project would not, make a substantial contribution to the loss of a mineral resource. The proposed project would not preclude any area from use as mineral extraction and it is not feasible to use the project site for mineral resources. Thus, the proposed project would not in conjunction with any other past present or reasonably foreseeable project result in a cumulative significant impact. As a result, no cumulative impacts related to mineral resources would occur and mitigation is not required.

NOISE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
13. NOISE. Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			**X**	
b) Generation of excessive groundborne vibration or groundborne noise levels?			**X**	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			**X**	

REGULATORY SETTING

State

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of "normally acceptable", "conditionally acceptable", "normally unacceptable", and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 CNEL and "conditionally acceptable" up to 70 CNEL. Multiple-family residential uses are "normally acceptable" up to 65 CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code

The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as

residential buildings, schools, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings, the acceptable interior noise limit for new construction is 45 dBA CNEL.

Local

City of Tracy General Plan

TheTracy General Plan identifies goals and policies in the Noise Element. The Noise Element identifies and appraises noise generation in the community in order to minimize problems from intrusive sound and to ensure that development does not expose people to unacceptable noise levels. Relevant policies are listed below:

Objective N-1.2: Control sources of excessive noise.

P1: The City's Noise Ordinance, as revised from time to time, shall prohibit the generation of excessive noise.

P2: Mitigation measures shall be required for new development projects that exceed the following criteria:

- Cause the L_{dn} at noise-sensitive uses to increase by 3 dB or more and exceed the "normally acceptable" level.
- Cause the L_{dn} at noise-sensitive uses to increase 5 dB or more and remain "normally acceptable.

Cause new noise levels to exceed the City of Tracy Noise Ordinance limits.

P3: Pavement surfaces that reduce noise from roadways should be considered as paving or repavement opportunities arise.

P4: All construction in the vicinity of noise sensitive land uses, such as residences, hospitals, or convalescent homes, shall be limited to daylight hours or 7:00 AM to 7:00 PM. In addition, the following construction noise control measures shall be included as requirements at construction sites to minimize construction noise impacts:

- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.
- Locate stationary noise-generating equipment as far as possible from sensitive receptors when sensitive receptors adjoin or are near a construction area.

Utilize "quiet" air compressors and other stationary noise sources where technology exists.

Objective N-1.3: Consider noise issues in the Development Review process.

P1: Development projects shall be evaluated for potential noise impacts and conflicts as part of the Development Review process.

P2: Significant noise impacts shall be mitigated as a condition of project approval.

P3: New development projects shall have an acoustical specialist prepare a noise analysis with recommendations for design mitigation if a noise-producing project is proposed near existing or planned noise-sensitive uses.

P5: Site design techniques shall be considered as the primary means to minimize noise impacts as long as they do not conflict with the goals of the Community Character Element. Techniques include:

- Designing landscaped building setbacks to serve as a buffer between the noise source and receptor.
- Placing noise-tolerant land uses, such as parking lots, maintenance facilities, and utility areas between the noise source, such as highways and railroad tracks, and receptor.
- Orienting buildings to shield noise sensitive outdoor spaces from a noise source.
- Locating bedrooms or balconies on the sides of buildings facing away from noise sources.

Utilizing noise barriers (e.g., fences, walls, or landscaped berms) to reduce adverse noise levels in noise-sensitive outdoor activity areas.

City of Tracy Municipal Code

In addition to the standards set forth within the General Plan, Title 4.12, Article 9, Noise Control Ordinance, the City's Municipal Code provides the following General Sound Level Limits (Section 4.12.750):

- Residential Districts have a noise limit of 55 dBA
- Commercial Districts have a noise limit of 65 dBA
- Industrial Districts have a noise limit of 75 dBA
- Agricultural Districts have a noise limit of 75 dBA
- Aggregate Mineral Overlay Zones have a noise limit of 75 dBA

The City's Municipal Code, Title 4.12, Article 9, Noise Control Ordinance, provides the following construction and operational noise standards (Section 4.12.820):

Construction Noise Prohibition

The operation between the hours of 10:00 PM and 7:00 AM of any pneumatic or air hammer, pile driver, steam shovel, derrick, steam, or electric hoist, parking lot cleaning equipment, or other appliance, the use of which is attended by loud or unusual noise.

Business and Residential Relationships

Delivery vehicles shall have their engines turned off when stationary during the regular business hours (6:00 AM to 11:00 PM).

It is unlawful for stores to be loading, unloading, opening or other handling of boxes, crates, containers, building materials, garbage cans, other similar objects and trash compactor operations between the hours of 10:00 PM and 7:00 AM in an area between a business and residential in such a manner to cause a noise disturbance across a residential property line or at any time to violate the general sound level limits.

Store deliveries by motorized refrigeration systems shall not be left running between the hours of 10:00 PM and 7:00 AM within seventy-five feet of a residential zone, residential use, or sleeping quarters.

Note that the noise ordinance requirements cannot be applied to mobile noise sources, such as heavy trucks, when traveling on public roadways. Federal and State laws preempt control of mobile noise sources on public roads and airports.

EXISTING CONDITIONS

Existing Noise Sources

The City of Tracy is impacted by various noise sources. Mobile sources of noise, especially cars and trucks, are the most common and significant sources of noise in the City. Other sources of noise are the various land uses (i.e., residential, commercial, institutional, and recreational and parks activities) throughout the City that generate stationary-source noise.

Existing Stationary Noise

The primary sources of stationary noise in the project vicinity are those associated with the operations of industrial uses to the east, agricultural operations to the west, and nearby residential uses to the northeast and west of the project site. The noise associated with these sources may represent a single-event noise occurrence, short-term noise, or long-term/continuous noise.

Sensitive Receptors

Noise exposure standards and guidelines for various types of land uses reflect the varying noise sensitivities associated with each of these uses. Residences, hospitals, schools, guest lodging, libraries, and churches are treated as the most sensitive to noise intrusion and therefore have more stringent noise exposure targets than do other uses, such as manufacturing or agricultural uses that are not subject to impacts such as sleep disturbance. Adjacent land uses consist of industrial and agricultural operations with single-family residential uses located to the west and northeast. As shown in *Table 4-7: Sensitive Receptors,* sensitive receptors near the project site include multi- and single-family residences. These distances are from the project site to the sensitive receptor property line.

Table 4-7: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Single-family residential	50 feet east
Multi-family residential	330 feet northeast
Single-family residential	725 feet east
Single-family residential	1,075 feet northwest

ENVIRONMENTAL IMPACTS

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant Impact. Construction activities have the potential to create temporary, or periodic increases in ambient noise levels in the project vicinity above levels existing without the project. During the construction of the project, noise from construction activities would add to the noise environment in the project vicinity. The roadway construction would include the use of heavy equipment that can generate noise. Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction site. This noise increase would be of short duration and would likely occur primarily during daytime hours.

Noise sensitive receptors near the construction site would, at time, experience noise levels from construction activities; however, construction-related noise generally would occur during daytime hours only. The project site and vicinity were assumed for urban development as part of the City's General Plan and evaluated in the General Plan EIR. Build-out of the City's General Plan land use map, including the proposed roadway widening, will inherently result in construction and construction-related noise levels. Adherence to the City General Plan and City Municipal Code (Title 4.12, Article 9, Noise Control Ordinance), would minimize any impacts from noise during construction to the extent practicable. Because of the nature, time, and duration of construction activities near sensitive receptors noise impacts from construction activities would cease upon project completion. Therefore, implementation of the proposed project would have a less than significant impact relative to this topic.

Project construction would occur approximately 50 feet from the nearest sensitive receptor to the east along Corral Hollow Road. However, construction activities would occur throughout the project site and would not be concentrated at a single point near sensitive receptors. Noise levels typically attenuate (or drop off) at a rate of 6 dB per doubling of distance from point sources, such as industrial machinery. Noise generated by construction equipment can reach high levels. Typical noise levels associated with individual construction equipment are listed in *Table 4-8: Typical Construction Noise Levels.*

Table 4-8: Typical Construction Noise Levels

Equipment	Maximum Noise Level (dBA) from Source 50 feet (reference level)
Air Compressor	80
Backhoe	80
Compactor	82
Concrete Mixer	85
Concrete Pump	82
Concrete Vibrator	76
Crane, Mobile	83
Dozer	85
Generator[1]	56
Grader	85
Impact Wrench	85
Jack Hammer	88
Loader	80
Paver	85
Pneumatic Tool	85
Pump	77
Roller	85
Saw	76
Scarifier	83
Scraper	85
Shovel	82
Truck	84

1. Generator would include CAT XQ60 Rental Generator Set.
Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

Objective N-1.2, Policy P4 of the City's General Plan limits construction activities in the vicinity of noise sensitive land uses, such as residences, to 7:00 AM to 7:00 PM. The City's Municipal Code does not establish quantitative construction noise standards. Instead, the Municipal Code establishes limited hours of construction activities. As a result, this analysis conservatively uses the Federal Transit Authority's (FTA) threshold of 80 dBA (8-hour Leq) for residential uses to evaluate construction noise impacts. All motorized equipment used in such activity shall be equipped with functioning mufflers as mandated by the State.

Noise impacts for mobile construction equipment are typically assessed as emanating from the center of the equipment activity or construction site. Due to the nature of the project site and limitations on how many pieces of equipment can operate within the same area, maximum construction noise has been calculated for the loudest piece of equipment at the center of the construction area located nearest to sensitive receptors (approximately 65 feet and 330). The Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) was used to calculate noise levels during construction activities; refer to Appendix E: Noise Data. RCNM is a computer program used to assess construction noise impacts and allows for user-defined

construction equipment and user-defined noise limit criteria. Noise levels were calculated for each construction phase and are based on the equipment used, distance to the nearest property/receptor, and acoustical use factor for equipment.

The noise levels calculated in *Table 4-9: Project Construction Noise Levels*, show estimated exterior construction noise at the closest receptors to east and northeast of the project site. Based on calculations using the RCNM model, construction noise levels would range from approximately 77.7 dBA L_{eq} and 78.7 dBA L_{eq} and the single family residence located along Corral Hollow Road (located 65 feet from the centerline of Corral Hollow Road) and 63.6 dBA L_{eq} to 64.6 dBA L_{eq} at the multi-family residences to the northeast (located approximately 330 feet from the project site); see *Table 4-9*. The construction noise levels would not exceed the applicable FTA construction thresholds. Construction equipment would operate throughout the project site and the associated noise levels would not occur at a fixed location for extended periods of time. Although sensitive uses may be exposed to elevated noise levels during project construction, these noise levels would be acoustically dispersed throughout the project site and not concentrated in one area near sensitive uses. the impact from construction noise would be less than significant level.

Table 4-9: Project Construction Noise Levels

Construction Phase	Receptor Distance	Receptor Direction	Receptor Use	Modeled Exterior Noise Level (dBA L_{eq}) [2]	Noise Threshold (dBA L_{eq}) [3]	Exceeded?
Grubbing/Land Clearing	65	East	Single Family Residential	77.7	80	No
	330	Northeast	Multi-Family Residential	63.6		No
Grading/Excavation	65	East	Single Family Residential	78.7		No
	330	Northeast	Multi-Family Residential	64.6		No
Drainage/Utilities	65	East	Single Family Residential	78.7		No
	330	Northeast	Multi-Family Residential	64.6		No
Paving	65	East	Single Family Residential	77.7		No
	330	Northeast	Multi-Family Residential	63.6		No

Notes:
1. Distance is from the nearest receptors to the nearest construction activity area on the project site.
2. Modeled noise levels assume the operation of the loudest piece of equipment at the center of the construction area located nearest to sensitive receptors.
3. Federal Transit Authority's threshold of 80 dBA (8-hour Leq) for residential uses.

Source: Federal Highway Administration, *Roadway Construction Noise Model,* 2006. Refer to Appendix E: Noise Data for noise modeling results.

Although project construction would occur during normal daytime hours and would not exceed FTA thresholds, construction activities could result in a noticeable increase in ambient noise levels in the area. Therefore, prior to the issuance of any grading permits, the project applicant shall submit and implement a Construction Noise Management Plan that specifies hours of construction, noise and vibration minimization measures, posting and notification of construction schedules, equipment to be used, and designation of a noise disturbance coordinator. The noise disturbance coordinator shall respond to neighborhood complaints and shall be in place prior to the start of construction and implemented during construction to reduce noise impacts on neighboring residents and other uses. The noise logistic plan shall be submitted to the Community Development Department Director or Director's designee of the Director of the Community Development Department prior to the issuance of any grading permits. The Construction Noise Management Plan would help to reduce noise levels associated with the construction of the proposed project. Thus, the proposed project would have a less than significant impact in this regard.

Construction Noise Management Plan

Noise reduction measures may include, but are not limited to, the following:

a) Equipment and trucks used for project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds) wherever feasible.

b) Except as provided herein, impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used. This muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used, if such jackets are commercially available. this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures.

c) Temporary power poles shall be used instead of generators where feasible.

d) Stationary noise sources shall be located as far from adjacent properties as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the City of provide equivalent noise reduction.

e) The noisiest phases of construction shall be limited to less than 10 days at a time. Exceptions may be allowed if the City determines an extension is necessary and all available noise reduction controls are implemented.

f) Delivery of materials shall observe the hours of operation described above.

g) Truck traffic should avoid residential areas to the extent possible.

Construction Traffic Noise

Construction is estimated to be approximately three months. Construction noise may be generated by large trucks moving materials to and from the project site. Large trucks would be necessary to

deliver building materials as well as remove dump materials. The project would export a total of approximately 8,985 cubic yards (cy) and import a total of 217 cy of soil during grading. Based on the Road Construction Emissions Mode (RCEM) default assumptions for this project, the project would generate the highest number of daily trips during the grading phase. The model estimates that the project would generate up to 30 worker roundtrips, 47 daily hauling roundtrips, and five water truck roundtrips per day during grading.

According to Objective N-1.2, Policy P2 of the City's General Plan, mitigation would be required for new development that would cause a permanent noise increase of 3 dBA Ldn or more and exceed the "normally acceptable" level or cause a noise increase of 5 dBA Ldn or more and remain "normally acceptable". For reference, a 3 dBA Ldn noise increase would be expected if the project would double existing traffic volumes along a roadway and a 5 dBA Ldn noise increase would be expected if the project would triple existing traffic volumes along a roadway. Corral Hollow Road has approximately 633 PM peak hour trips.[2] A maximum of 82 peak hour project construction trips (assuming that all workers, haul trucks, and water trucks would travel from the site during the PM peak hour) would not double or triple the existing traffic volume. Therefore, construction related traffic noise would not be noticeable and would not create a significant noise impact.

Operations

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased traffic noise. Therefore, increase in operational noise is not anticipated.

b) Generation of excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact. Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise, vibration consists of an amplitude and frequency. A person's perception to the vibration will depend on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system which is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocity (PPV) in inches per second

[2] City of Tracy, *Tracy Hills Specific Plan Recirculated Draft Subsequent EIR,* Table 4.13-8, October 2015

(in/sec). Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of peak particle velocities.

Human and structural response to different vibration levels is influenced by several factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. FTA data indicates that the threshold for damage to structures ranges from 0.2 to 0.6 in/sec PPV. One-half this minimum threshold or 0.1 in/sec PPV is considered a safe criterion that would protect against architectural or structural damage. The general threshold at which human annoyance could occur is noted as 0.1 in/sec PPV.

Construction

Increases in groundborne vibration levels attributable to the project would be primarily associated with construction-related activities. Construction on the project site would have the potential to result in varying degrees of temporary groundborne vibration, depending on the specific construction equipment used and the operations involved. Ground vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The effect on buildings located in the vicinity of the construction site often varies depending on soil type, ground strata, and construction characteristics of the receiver building(s). The results from vibration can range from no perceptible effects at the lowest vibration levels, to low rumbling sounds and perceptible vibration at moderate levels, to slight damage at the highest levels. Groundborne vibrations from construction activities rarely reach levels that damage structures.

The types of construction vibration impacts include human annoyance and building damage. Human annoyance occurs when construction vibration rises significantly above the threshold of human perception for extended periods of time. Building damage can be cosmetic or structural. Ordinary buildings that are not particularly fragile would not experience cosmetic damage (e.g., plaster cracks) at distances beyond 30 feet. This distance can vary substantially depending on soil composition and underground geological layer between vibration source and receiver.

The FTA has published standard vibration velocities for construction equipment operations. In general, depending on the building category of the nearest buildings adjacent to the potential pile driving area, the potential construction vibration damage criteria vary. For example, for a building constructed with reinforced concrete with no plaster, the FTA guidelines show that a vibration level of up to 0.50 inch per second (in/sec) peak particle velocity (PPV) is considered safe and would not result in any construction vibration damage.

Table 4-10: Typical Construction Equipment Vibration Levels, lists vibration levels at 25 feet, 50 feet, and 125 feet for typical construction equipment. Groundborne vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. As indicated in *Table 4-10*, based on FTA data, vibration velocities from typical heavy construction equipment operations that would be used during project construction range from 0.003 to 0.089 in/sec PPV at 25 feet from the source of activity.

Table 4-10: Typical Construction Equipment Vibration Levels

Equipment	Peak Particle Velocity At 25 feet (in/sec)	Peak Particle Velocity At 50 feet (in/sec)	Peak Particle Velocity At 125v feet (in/sec)
Vibratory Roller	0.210	0.074	0.0113
Large Bulldozer	0.089	0.032	0.0048
Loaded Trucks	0.089	0.032	0.0048
Small Bulldozer/Tractors	0.003	0.001	0.0002

1. Calculated using the following formula: PPVequip = PPVref x (25/D)1.5, where: PPVequip = the peak particle velocity in in/sec of the equipment adjusted for the distance; PPVref = the reference vibration level in in/sec from Table 7-4 of the Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, 2018; D = the distance from the equipment to the receiver.

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018.

As shown in *Table 4-10*, the highest vibration levels are achieved with the vibratory roller operations. This construction activity is expected to take place during grading and paving. The nearest structure is approximately 50 feet from the active construction zone. As indicated in *Table 4-10*, construction vibration levels at the nearest sensitive receptors (50 feet away) would not exceed the FTA's 0.20 PPV threshold for construction vibration damage or the 0.1 in/sec PPV threshold of human annoyance. In addition, construction activities would occur throughout the project site and would not be concentrated at the point closest to the nearest structure. Therefore, vibration impacts associated with the project would be less than significant.

Operations

The project would not generate groundborne vibration that could be felt at surrounding uses. Project operations would not involve railroads or substantial heavy truck operations, and therefore would not result in vibration impacts at surrounding uses. As a result, impacts from vibration associated with project operation would be less than significant.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less Than Significant Impact. The proposed project is located within the Airport Land Use area for the Tracy Municipal Airport, which is located east of the project site. Tracy Municipal Airport is owned and operated by the City of Tracy. The airport is a general aviation airport and provides a range of aviation services including general aviation and jet fuel sales, and hangar and tie down rentals. The project site is located in the 60 dB event contour for this airport.

The project does not include any permanent residents or other uses that would place workers or other people in long-term exposure or in proximity to noise from the airport. However, in the short-term, workers within the project area could be subject to noise levels up to 60 dB as a result of the Tracy Municipal Airport operations. These noise levels would be short-term and infrequent.

Additionally, the construction workers are subject to loud noises as a result of construction equipment operation. The infrequent, short-term noise exposure along the project alignment would not result in health or safety concerns for the workers in the area. Additionally, construction workers typically use safety equipment, such as ear plugs or earmuffs, which can reduce noise level during particularly noisy activities. Implementation of the proposed project would have a less than significant impact and mitigation is not required.

Cumulative Impacts

Cumulative Construction Noise

The project's construction activities would not result in a substantial temporary increase in ambient noise levels. The City limits construction to the hours of 7:00 a.m. to 7:00 p.m. on Monday through Friday. The project would contribute to other proximate construction noise impacts if construction activities were conducted concurrently. However, based on the noise analysis above, the project's construction-related noise impacts would be less than significant following compliance with local regulations and the Construction Noise Management Plan outlined above.

Construction activities at other planned and approved projects would be required to take place during daytime hours, and the City and project applicants would be required to evaluate construction noise impacts and implement mitigation, if necessary, to minimize noise impacts. Each project would be required to comply with the applicable City of Tracy Municipal Code limitations on allowable hours of construction. Therefore, project construction would not contribute to cumulative impacts and impacts in this regard are not cumulatively considerable.

Cumulative Operational Noise

Cumulative noise impacts describe how much noise levels are projected to increase over existing conditions with the development of the project and other foreseeable projects. Cumulative noise impacts would occur primarily as a result of increased traffic on local roadways due to the buildout to of the area. As discussed above, the project would not directly result in an increase in operations at the intersection of Corral Hollow Road and Linne Road. Therefore, no impact would occur.

POPULATION AND HOUSING

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
14. POPULATION AND HOUSING. Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			**X**	
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?			**X**	

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The project site is currently designated for industrial, commercial, and urban reserve. The proposed project does not include any residential uses that would directly generate new residents and increase the population within the City or County. The proposed project also would not result in intensification of land uses, or the addition of structures or uses that would differ from the current General Plan, or that would require new employees or uses that would increase demand for permanent employees.

Projects that would not directly increase population still have the potential to result in indirect population growth through the creation of jobs or the extension of infrastructure into areas that were not previously served. While, the proposed project would increase the width and capacity of segments of Corral Hollow Road and Linne Road, install new signalization, and improve LOS, the improvements to the roadway system are a planned effort and coordinate with past and ongoing improvement plans to Corral Hollow Road to the north and south of the project. It should be noted all these improvements are along existing roadway segments. Lastly, in part, those improvements, as well as those of the proposed project would accommodate the future buildout under the General Plan. Thus, in this regard, the project would not result in growth inducement.

Although it is possible that demand for construction workers could induce a few workers to move into the City or Regional area for work opportunities, this is anticipated to be a very small number compared to the workers needed to build the project. In addition, because the size of the project is relatively small, the total demand for construction workers would be corresponding small. It is anticipated that with the recent and continuing growth of the City and County, there are adequate numbers of people already residing in the area and with existing construction companies to fill all

employment needs. Therefore, impacts from the proposed project to unplanned population growth are less than significant.

Lastly, any individual future projects would have to be consistent with the General Plan and are subject to environmental review under CEQA. No substantial population increases would result from implementation of the proposed project. Therefore, implementation of the proposed project would have a less than

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Less than significant Impact. The proposed project would result in the acquisition of portions of adjacent parcels for a total of approximately 1.59 total acres. The majority of these areas, however, consist of existing roadway shoulder, railroad right-of-way, orchard, and undeveloped property. Approximately 0.53 acres would be acquired from APN 025-311-020, which contains an existing business. The area acquired from this parcel, however, would be from an undeveloped portion of the parcel and no structures or habitable buildings would be removed or require removal. Thus, the proposed project would not displace any existing housing units or structures and would not result in a displacement. No replacement housing would be needed. Impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

Overall, the proposed project would serve the exiting demand from the existing population within the local vicinity and regional travelers. The proposed project is be consistent with the planned land uses in the City's General Plan and the population and employment projections for the City, County, and the region as a whole. While the proposed project result in minor takings, the project would not, in conjunction with other past, present, or reasonably foreseeable projects, make a substantial impact to cumulative growth. The proposed project and other projects that have been, will be developed, or that are in the planning process are considered in the context of their consistency with local and regional planning efforts to include population growth and the need for housing. Therefore, the proposed project would not cause a cumulatively considerable impact on population and housing and no mitigation is required.

PUBLIC SERVICES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
15. PUBLIC SERVICES. Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
i) Fire protection?			**X**	
ii) Police protection?			**X**	
iii) Schools?			**X**	
iv) Parks?			**X**	
v) Other public facilities?			**X**	

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

i) Fire protection?

Less Than Significant Impact. The project site is currently under the jurisdiction of the San Joaquin County Fire Authority (SSJCFA, 2022). The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in an intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for emergency services. Accordingly, the proposed project would not require the expansion or development of a new fire station or any other fire

infrastructure, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

ii) Police protection?

Less Than Significant Impact. The project site is currently under the jurisdiction of the Tracy Police Department (TPD) and the San Joaquin Sheriff's Office (SJSO). The proposed project would not include additional residential units, or people to the City of Tracy. The proposed project includes the widening of Corral Hollow Road (within SJSO jurisdiction) and Linne Road and signalization of the intersection (within TPD jurisdiction). These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for law enforcement services. Accordingly, the proposed project would not require the expansion or development of a new police station, or any other police related infrastructure, the construction of which could result in impacts to the environment. In addition, should emergency services be required, because the City and County boundaries would not change, the service areas for each department would not change. Thus, Impacts would be less than significant, and no mitigation is required.

iii) Schools?

Less Than Significant Impact. The San Joaquin County of Education is a regional agency that provides education al leadership, resources, and customized services to assist school districts that includes the Tracy Unified School District (SJCOE, 2022a and b). Residents within the vicinity of the project are served by the Tracy Unified School District for public education needs. The proposed project would not include additional residential units, or people to the City of Tracy. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for school services. Accordingly, the proposed project would not require the expansion or development of a school or any other education related infrastructure, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

iv) Parks?

Less Than Significant Impact. The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of parks within the City or region. Accordingly, the proposed project would not require the expansion or development of any park, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

v) Other public facilities?

Less Than Significant Impact. Other public facilities in the area such as health care, production, commercial, retail, residential, etc. would not be adversely impacted. The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of other public services. Accordingly, the proposed project would not require the expansion or development of any of these resources, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

The proposed project would not include additional residential units, or people to the City of Tracy or the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of public services within the City or region. The proposed project also would not combine with past, present, and reasonably foreseeable project such that a cumulative impact would result. Lastly, the proposed project would not result in substantial incremental effects to public services or facilities that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable projects. The project alone would not result in cumulatively considerable impacts to public services or facilities.

RECREATION

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
16. RECREATION.				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			**X**	
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?			**X**	

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less Than Significant Impact. The proposed project does not include any residential units or any other type of use that would increase the population, or park and recreation facility demand in the area, or include any other type of use that would directly increase the use of park and recreation facilities. The proposed project would not result in an intensification of land uses, or the addition of structures or uses that would differ from the current General Plan. Therefore, the proposed project would not result in a substantial increase on the demand for existing recreational resources such that substantial physical deterioration would occur or be accelerated. Thus, impacts of the proposed project would be less than significant in this regard and mitigation is not required.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Less Than Significant Impact. The proposed project consists of a roadway improvements projects but does not include any new recreational resources that could result in impacts on the environment beyond those already evaluated as part of this document. Thus, the proposed project would not have a significant adverse physical effect on the environment, impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

Development of the proposed project would not create a significant cumulative increase of recreational facilities. In addition, the proposed project would not combine with other past, present, or reasonably foreseeable projects and result in significant cumulative impacts. The

project would not impact any existing recreation facilities and would not create a substantial population increase to impact existing recreational facilities. Therefore, no cumulative impacts on recreational facilities would occur.

TRANSPORTATION

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
17. TRANSPORTATION. Would the project:				
a) Conflict with an program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?			**X**	
b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?			**X**	
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			**X**	
d) Result in inadequate emergency access?			**X**	

a) Conflict with an program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less than Significant Impact. No new structures, uses, or visitor serving areas are included in the project. The proposed project does not result in an overall increase in vehicle trips but would serve existing deficiencies and tie into existing two-lane improvements to the north and south within Corral Hollow Road. The proposed project does not include any trip generating uses that would result in additional vehicle miles travelled or a reduction of LOS. The proposed project also would include sidewalks and bicycle facilities along the widened roadway that would provide residents and users in the area with access to these alternative transportation uses. Impacts in this regard would be less than significant, and no mitigation is required.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Less Than Significant Impact. CEQA Guidelines Section 15064.3 states that "vehicle miles traveled" (VMT) is the preferred metric evaluating transportation impacts, rather than LOS. VMT measures the total miles traveled by vehicles generated by a project. While LOS focuses on motor vehicle traffic, VMT accounts for the total environmental impact of a project on transportation, including use of travel modes such as buses or bicycles. Section 15064.3(b) sets forth the criteria for analyzing transportation impacts using the preferred VMT metric.

As discussed in a) above, the proposed project does not include any new uses or structures, or visitor serving areas and it would not result in an overall increase in vehicle trips or vehicle miles

travelled. The proposed project would serve existing uses that are anticipated to be developed in accordance with adopted planning documents and improve the level of service and functionality of the intersection and roadways. Thus, impacts related to increased VMT are less than significant.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. No site circulation or access issues have been identified that would cause a traffic safety problem/hazard or any unusual traffic congestion or delay that could impede emergency vehicles or emergency access. The project does not include any design features or incompatible used that pose a significant safety risk. The project would create no adverse impacts to emergency vehicle access or circulation. Therefore, project implementation would have a less than significant impact in this regard.

d) Result in inadequate emergency access?

Less Than Significant Impact. Emergency vehicle access would be maintained at all times throughout construction activities, in accordance with the City and County routine/standard construction specifications as applicable. No site circulation or access issues have been identified that would cause a traffic safety problem/hazard or any unusual traffic congestion or delay that would impede emergency access to any local roadways or surrounding properties or result in a safety risk. All driveways and roads would be constructed to accommodate all emergency vehicles and personnel. Therefore, implementation of the proposed project would have a less than significant impact in this regard.

Cumulative Impacts

The proposed project would improve LOS at the intersection with the widening of the roadways to tie into existing and on-going roadway improvements and construction of signals and increase the functionality of travel in the area. The proposed project is intended to serve existing and planned uses and does not include any uses, combined with other past, present, and reasonably foreseeable projects that would contribute to an increase in VMT. Although other future uses in the vicinity including new residential uses may generate new vehicle trips, the proposed project would not generate new trips and would only serve to accommodate travel between existing and planned uses. Therefore, the proposed project would not result in incremental effects to transportation that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Potential impacts are not cumulatively considerable and less than significant.

TRIBAL CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
18. TRIBAL CULTURAL RESOURCES. Would the project:				
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?		**X**		
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?		**X**		

a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

And,

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Potentially Significant Unless Mitigation Incorporated. An *Archaeological Survey Report* for project site was conducted by Horizon Water and Environment in July 2022. As previously mentioned, there were no historical resources found to be impacted by the proposed project, this is substantiated through a CHRIS records search, background research, review of historical topographic and aerial imagery, a Sacred Land File Search, and a pedestrian survey. However, the absence of substantial surface prehistoric or historic-period archeological remains within the project vicinity and the existing level of disturbance does not preclude the possibility of subsurface resources.

The City has notified California Native American tribes who have formally requested notification on CEQA projects under Assembly Bill 52. This included notification to eight tribes (Ione Band of Miwok Indians, The Confederated Villages of Lisjan, Muwekma Ohlone Indian Tribe of the SF Bay Area, North Valley Yokuts Tribe, Tule River Indian Tribe, Buena Vista Rancheria of Me-Wuk Indians, Wilton Rancheria, and Wuksache Indian Tribe/Eshom Valley Band).

These notification letters were distributed to identified Native American Tribes on August 1, 2022. These letters are on file at the City of Tracy Planning Department. As of 30 days after sending the letters and publication of this document. No tribes have requested formal consultation.

Examples of significant archaeological discoveries that may meet the tribal cultural resource definition would include villages and cemeteries. Due to the possible presence of unknown tribal cultural resources within the project site, construction related impacts on tribal cultural resources would be potentially significant. Though the circumstances would present a low possibility, the following mitigation measure (MM) would reduce impacts in the unanticipated discovery of cultural resources during construction. With the implementation of **MM CUL-1**, **MM CUL-2**, and **MM CUL-3** above in Section 4.5 Cultural Resources, impacts would be less than significant.

Cumulative Impacts

The combination of the proposed project as well as past, present, and reasonably foreseeable projects in the local area would be required to comply with all applicable State, federal, and County and local regulations concerning preservation, salvage, or handling of cultural and paleontological resources, including compliance with required mitigation. Similar to the proposed project, these projects also would be required to implement and conform to mitigation measures, which would be likely to reduce impacts to less than significant. Although in the process of roadway improvements, some known or unknown resources may be lost, it is not anticipated that these impacts would be cumulatively considerable. In addition, implementation of Mitigation Measures **MM CUL-1, MM CUL-2,** and **MM CUL-3** would reduce project-specific impacts to a less than significant level. Therefore, the project's contribution to cumulative impacts would be less than significant.

UTILITIES AND SERVICE SYSTEMS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
19. UTILITIES AND SERVICE SYSTEMS. Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?			**X**	
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?			**X**	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?			**X**	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			**X**	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?			**X**	

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. The proposed project will not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. The proposed project would not include additional residential units, or people to the City of Tracy or within the County such that new or expanded utilities would be required. No additional demand for water, wastewater, storm water drainage, electric power, natural gas, or telecommunications facilities will be created by the project. The project includes the widening of Corral Hollow Road and Linne Road, signalization of the intersection, installation of new lights, and curb and gutter and sidewalk

improvements. These improvements are part of a planned effort to coordinate improvements to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA. Accordingly, the proposed project would not require the expansion or development of new utilities that, the construction of which could result in impacts to the environment. Impacts would be less than significant, and no mitigation is required.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. The proposed project will not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. The proposed project would not include additional residential units, or people to the City of Tracy or within the County such that new demand for water would occur, or such that new or expanded water infrastructure would be required. The project includes the widening of Corral Hollow Road and Linne Road, signalization of the intersection, installation of new lights, and curb and gutter and sidewalk improvements. These improvements are part of a planned effort to coordinate improvements to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA.

It should be noted that limited volumes of water would be necessary during construction related activities for watering of soils for dust control, washing vehicles, mixing materials, etc. This use, however, would be temporary in nature for construction related activities only, and would not be in substantial volumes. Thus, the proposed project would not result is substantial use of water from the existing supplies during normal, dry, or multiple dry years. The project water demand would be served through existing entitlements and resources. Impacts would be less than significant in this regard and mitigation is not required.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments

Less Than Significant Impact. As previously stated, the proposed project would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. No additional demand for wastewater treatment, or other water treatment facilities would be needed or are proposed as part of the project. The proposed project could relocate some utilities within the project site to facilitate the transportation improvements such as electrical connections and horizontal movement of other lines (e.g., water, gas, etc.). The proposed project, however; would not increase the service capacity of these lines and the relocation would not be made with the intent to serve undeveloped areas. The movement of lines would, however, be done to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA. Thus, the proposed project would not result in any new wastewater generators, nor does it propose any improvements that would result in increased treatment demand by

wastewater treatment provider that new capacity would be needed. Impacts would be less than significant, and mitigation is not required.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? And,

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. As previously stated, the proposed project will not result in an intensification of land use, or the addition of structures or uses that would result in an increased demand for services. The proposed project is consistent with the General Plan and would be used to serve the existing and planned land uses in the vicinity. The proposed project would not result in a long-term use that would generate substantial volumes of waste that would require disposal. Construction of the proposed project, however, would result the generation of minor volumes of solid waste. Because the project consists of roadway improvements and does not include any structures that require building materials, waste generation would be minimal. Waste that is generated during construction could be self-hauled, or contract services with Tracy Delta Solid Waste Management could be made. Waste would be recycled as possible at the Lovelace Materials Recovery Facility and Transfer Station with non-recyclable materials anticipated to be taken to the Foothill Sanitary Landfill, which is projected to be open until 2082 and the project would not substantially reduce capacity.

Thus, the proposed project would not interfere with regulations related to solid waste or generate waste in excess of the capacity of local infrastructure. The proposed project would have a less than significant impact in this regard.

Cumulative Impacts

Utilities are generally provided or delivered on a local level but often originate from sources outside local areas as most areas are served through the regional distribution system. As discussed above, the proposed project does not include any uses that would require long term utilities services within the exception of a minimal increase in electricity demand for new traffic signals and lights. Taken in conjunction with past, present, and reasonably foreseeable projects the overall increased demand for utilities would be incrementally small and the project would not make a substantial cumulative contribution. Therefore, implementation of the project would not result in a cumulatively considerable contribution to impacts on water supply and wastewater, stormwater, or solid waste generation.

WILDFIRE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
20. WILDFIRE. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?			**X**	
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?			**X**	
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?			**X**	
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?			**X**	

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The proposed project includes roadway improvements and would not substantially impair an adopted emergency response plan or emergency evacuation plan. The proposed project could, during construction, require short term lane closures, and intermittent reductions in travel volumes and speeds due to the presence of equipment and personnel, but these interruptions would be temporary. After construction, the project would increase continuity between existing segments of both Corral Hollow Road and Linne Road and improve the LOS within the roadways and intersections. This would improve the viability of the roadways for emergency access as well as evacuations. The proposed improvements would intermittently require roadway maintenance; but such work is inherent to roadway operations and would not substantially hinder emergency access or evacuation. Therefore, impacts from project implementation would be considered less than significant in this regard.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Less Than Significant Impact. The risk of wildfire is related to a variety of parameters, including fuel loading (vegetation), fire weather (winds, temperatures, humidity levels and fuel moisture contents) and topography (degree of slope). Steep slopes contribute to fire hazard by intensifying the effects of wind and making fire suppression difficult. Fuels such as grass are highly flammable because they have a high surface area to mass ratio and require less heat to reach the ignition point. The County has areas with an abundance of flashy fuels (i.e., grassland) in the County. The project would not result in development of structures or housing which would subject residents, visitors, or workers to long-term wildfire danger. Therefore, impacts from project implementation would be considered less than significant in this regard.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Less Than Significant Impact. The proposed project includes standard infrastructure improvements associated a roadway widening. The proposed project is not located in a very high or high wildfire hazard severity zone and is predominantly surrounded by industrial and agricultural uses that are not prone to wildfire. The proposed project does not include the need for construction of use of roadways, fuel breaks, or water sources that could exacerbate wildfire hazards. The project would include relocation of some utilities, but the relocation would not be in any area prone to wildfire, and it would not result in temporary or long-term impacts in this regard. Impacts would be less than significant, and no mitigation is required.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Less Than Significant Impact. The proposed project site is not in a VHFHSZ nor located near steep slopes or hillsides. The proposed project would implement efficient landscape maintenance practices and design measures to decrease the release of stormwater running off the site; therefore, the proposed project site would not expose people to downstream flooding or landslides as a result of runoff. Impacts would be less than significant.

Cumulative Impacts

The proposed project area is not subject to natural wildfire areas. Consequently, implementation of the proposed project would not create a significant cumulative impact that would exacerbate wildfires. Impacts would be less than significant.

MANDATORY FINDINGS OF SIGNIFICANCE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
21. MANDATORY FINDINGS OF SIGNIFICANCE. Does the project:				
a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?			**X**	
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?			**X**	
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?			**X**	

a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant Impact. The analysis in this Initial Study includes an evaluation of the project impacts associated with aesthetics, agricultural and forest resources, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation/traffic, tribal cultural resources, utilities and service systems, and wildfire. The analysis covers a broad spectrum of topics relative to the potential for the proposed Project to have environmental impacts. This includes the potential for the proposed project to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to

drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

The proposed project would occur within an existing roadway and other adjacent highly disturbed areas that do not contain resources that would be commonly used by sensitive species or contain sensitive biological resources. In addition, due to past development efforts the potential for cultural resources or tribal cultural resources to be present or located during construction activities is considered to be low. Thus, for the reasons presented throughout this document, the proposed project would not substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

Nonetheless, the proposed project would be approved with adoption of mitigation to reduce potential impacts to nesting birds and includes mitigation for inadvertent discovery of cultural resources. Thus, it was found that the proposed project would have either no impact, a less than significant impact, or a less than significant impact with the implementation of mitigation measures.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less Than Significant Impact. The analysis in this Initial Study includes an evaluation of the project impacts associated with aesthetics, agricultural and forest resources, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation/traffic, tribal cultural resources, utilities and service systems, and wildfire. The analysis covers a broad spectrum of topics relative to the potential for the proposed project to have environmental impacts. It was found that the proposed project would have either no impact, a less than significant impact, or a less than significant impact with the implementation of mitigation measures. These mitigation measures would also function to reduce the project's contribution to cumulative impacts.

The proposed project would not increase the population or the use of public services and systems and would not conflict with any applicable plans for the area. The proposed project would increase the capacity of the roadway system, which could allow for future development near the project area. However, all uses accommodated by the widening and LOS improvements, would be in accordance with the General Plan and land use map. Furthermore, any future projects would be subject to environmental review under CEQA. There are no significant cumulative or cumulatively considerable effects that are identified associated with the proposed project after the implementation of all mitigation measures. With the implementation of all mitigation measures

proposed in this Initial Study, the proposed project would have a less than significant impact relative to this topic.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less Than Significant Impact. Potential adverse project effects on human beings were discussed in Section, *Air Quality*; Section, *Geology and Soils (seismic hazards)*; Section, *Hazards and Hazardous Materials*; Section, *Hydrology and Water Quality (flooding);* Section, *Transportation (traffic hazards)*; and Section, *Wildfire*. No potential adverse effects on human beings were identified. Potential adverse effects that were identified would be reduced to levels considered less than significant through compliance with applicable laws, regulations, and City ordinances and standards, along with mitigation measures where necessary.

Data Entry Worksheet

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a
yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	Corral Hollow and Linne Road	
Construction Start Year	2024	Enter a Year between 2014 and 2040 (inclusive)
Project Type	2	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	3.00	months
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	1	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	0.50	miles
Total Project Area	1.00	acre
Maximum Area Disturbed/Day	1.00	acre
Water Trucks Used?	1	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/googlemaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing			
	Grading/Excavation	20.00	21.70	898.50
	Drainage/Utilities/Sub-Grade			
	Paving			
Asphalt	Grubbing/Land Clearing			
	Grading/Excavation			
	Drainage/Utilities/Sub-Grade			
	Paving			

Mitigation Options

On-road Fleet Emissions Mitigation		Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation		Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to confirm compliance with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation). Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that can be modified by the user, although those modifications are optional.

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Construction Periods	User Override of Construction Months	Program Calculated Months	User Override of Phase Starting Date	Program Default Phase Starting Date
Grubbing/Land Clearing	0.50	0.30	6/1/2024	1/1/2024
Grading/Excavation	0.50	1.20	6/15/2024	1/17/2024
Drainage/Utilities/Sub-Grade	0.67	1.05	7/1/2024	2/2/2024
Paving	1.00	0.45	8/1/2024	2/23/2024
Totals (Months)		3		

Please note: You have entered a different number of months than the project length shown in cell D16.
Note: Soil Hauling emission default values can be overridden in cells D61 through D64, and F61 through F64.

Grading/Excavation	920	0	1,410	0	1,200	40
Drainage/Utilities/Sub-Grade	0	0	0	0	1,200	40
Paving	0	0	0	0	1,200	40

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> Corral Hollow and Linne Road				Total	Exhaust	Fugitive Dust	Total	Exhaust	Fugitive Dust					
Project Phases (Tons for all except CO2e. PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

The CO2e emissions are reported as metric tons per phase.

1 Introduction and Project Description

1.1 Introduction

The Roadway Improvements for Traffic Signal Installation at the Corral Hollow Road and Linne Road Intersection Project (Project or proposed Project) is located in the City of Tracy (City) within San Joaquin County, California (see Figure 1). More specifically, the project site is located within the existing road grades at the intersection of Corral Hollow Road and Linne Road. Both roads will be widened at the intersection to provide both through lanes and right-turn lane pockets, which will require the acquisition of new right of way (ROW), as well as utility relocation. The Union Pacific Railroad (UPRR) runs perpendicular (east-west) to W. Linne Road directly north of the intersection, where it is crossed by Corral Hollow Road.

1.2 Purpose and Need

The proposed road widening and signalization along Corral Hollow Road would maintain road width consistency along Corral Hollow Road and increase the intersection level of service (LOS) at the intersection with W. Linne Road. Corral Hollow Road is currently being widened north of the intersection with W. Linne Road and private development will fund the widening east and south of the intersection. The Project would widen Corral Hollow Road to match the width of these other projects. The intersection of Corral Hollow Road currently operates at a deficient LOS. The improvements, including widening, addition of a dedicated turn lane, and addition of signalization, would improve the LOS. Intersection improvements would improve mobility, alleviate traffic congestion, and improve traffic efficiency along Corral Hollow Road.

1.3 Project Description

The proposed Project would make transportation improvements to Corral Hollow Road and Linne Road, within the intersection of the two roadways and within portions of adjacent parcels. Improvements would include widening Corral Hollow Road and Linne Road, and the addition of signals within the intersection.

Corral Hollow Road would be widened to two (2) travel lanes in each direction. These project improvements would start immediately north of the UPRR ROW and extend southerly to approximately 500 feet south of the intersection with W. Linne Road. Other improvements proposed along Corral Hollow Road would include the construction of a center median, curbs, and sidewalks. New sidewalk and curb and gutter would be installed on the westerly side of the roadway and at the two corners of the intersections. Standard sidewalks and curb ramps would be Americans with Disabilities Act (ADA) compliant. In addition, the driveways to the adjacent properties would be improved with new concrete driveways. A total of four new driveways would be installed.

A new retention basin (approximately 0.35 acres/15,400 square feet) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Other standard improvements would include the installation of new signage, roadway striping, and crosswalks. All roadway improvements would conform to Caltrans and City standards as applicable.

Minor improvements to W. Linne Road would be made, primarily in the westbound lanes. The road would be widened to enable paving and striping of a new right turn only lane. The existing left lane

would remain and be used as a left only lane to southbound Corral Hollow Road. The proposed Project would also install new traffic signals at the intersection of Corral Hollow Road and W. Linne Road as well as streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal, the pre-signal, and raising and lowering of guard arms, would be created in coordination with UPRR.

Some ROW acquisitions would be required. In addition to the listed 40 orchard trees above, approximately 151 other trees would be removed, for new ROW and a temporary construction easement. The project would also require removal of some existing hardscape and fencing, grinding and matching with existing pavement grades, and utility relocation.

It should be noted that Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed Project would widen Corral Hollow Road to match the width of this and other improvements to the south of the Project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane).

1.3.1 Stormwater

The proposed Project would include new stormwater facilities and would utilize an approximate 0.35-acre retention basin to contain stormwater flows, promote water infiltration, and reduce potential for increased downstream stormwater flows.

1.3.2 Utilities

The proposed Project would tie into existing utilities for electrification of the new signals, streetlights, and other roadway and railroad crossings, as needed. As applicable, it would tie into existing water, stormwater, sewer, gas, electrical, and telecommunications utilities. Substantial alterations are not needed because the Project does not include new land uses. The proposed Project would realign the existing above ground utility lines and poles adjacent to the new roadways.

1.4 Construction

Some demolition, excavation, and grading would be required for this Project. Equipment that may be used to accomplish Project work is listed in Table 1 below. Some excavation to a maximum depth of 14 feet for the installation of traffic signal poles, six feet for the drainage feature, and four feet for road widening would be required only where these Project elements are proposed.

Table 1. Equipment

Bobcat/skid steer loader	Gradall (multi-purpose excavator)
Compactor (Ground)	Jackhammer
Concrete Mixer Truck	Pavement Scarifier/Roller
Concrete Saw	Pneumatic Tools
Crane or bucket truck	Truck (Dump/Flat Bed)
Dozer/Grader/Excavator/Scraper	

1.5 Biological Study Area

The Biological Study Area (BSA) includes the Corral Hollow Road and W. Linne Road intersection and adjacent areas (Figure 1). **Appendix A** provides representative site photographs.

2 Study Methods

2.1 Regulatory Requirements

2.1.1 Federal Endangered Species Act

The federal Endangered Species Act (ESA) is administered by the U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS). Overall, NMFS is responsible for protection of ESA-listed marine species and anadromous fish species, while other listed species fall under USFWS jurisdiction.

2.1.2 California Endangered Species Act

The California Endangered Species Act (CESA) incorporates provisions that permit impacts to species listed in California as rare, threatened, or endangered. CESA declares that it is the policy of the State that State agencies should not approve projects that would jeopardize the continued existence of a species listed under CESA as endangered or threatened or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if reasonable and prudent alternatives are available consistent with conserving the species or its habitat that would prevent jeopardy (California Fish and Game Code [CFGC] Section 2053).

Section 2080 of the CFGC prohibits the take of any species that is state-listed as endangered or threatened, or designated as a candidate for such listing. "Take" is defined by Section 86 of the California Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" an individual of a listed species. Under the CESA, the CDFW may issue an incidental take permit authorizing the take of listed and candidate species that is incidental to an otherwise lawful activity, subject to specified conditions.

2.1.3 Clean Water Act (CWA)

The federal Clean Water Act (CWA) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters. CWA requirements pertaining to the proposed project are described below.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S., must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Boards (RWQCB) administer the certification program in California.

Section 404 establishes United States Army Corps of Engineers (USACE) jurisdiction over fill materials in essentially all water bodies, including wetlands. All federal agencies are to avoid impacts to wetlands whenever there is a practicable alternative. Section 404 established a permit program administered by USACE regulating the discharge of dredged or fill material into waters of the U.S. (including wetlands).

Section 404 guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

2.1.4 Porter-Cologne Water Quality Control Act

The 1969 Porter–Cologne Water Quality Control Act (known as the Porter–Cologne Act) dovetails with the CWA. It established the State Water Resources Control Board (SWRCB) and divided the state into nine regions, each overseen by its own RWQCB. The SWRCB is the primary state agency responsible for protecting the quality of the state's surface water and groundwater supplies; however, much of the SWRCB's daily implementation authority is delegated to the nine RWQCBs, which are responsible for implementing CWA Sections 402 and 303[d]. In general, the SWRCB manages water rights and regulates statewide water quality, whereas RWQCBs focus on water quality within their respective regions.

The Porter–Cologne Act requires that the RWQCB develop water quality control plans (also known as Basin Plans) that designate beneficial uses of California's major surface-water bodies and groundwater basins and establish specific narrative and numerical water quality objectives for those waters. Beneficial uses represent the services and qualities of a waterbody (i.e., the reasons that the waterbody is considered valuable). Water quality objectives reflect the standards necessary to protect and support those beneficial uses. Basin Plan standards are primarily implemented by regulating waste discharges so that water quality objectives are met. Under the Porter–Cologne Act, Basin Plans must be updated every three years. Project activities that result in point-source discharges into state-regulated waters are subject to the RWQCB's Waste Discharge Requirements Program in order to ensure compliance with Basin Plan standards and water quality objectives.

2.1.5 Migratory Bird Treaty Act

The Migratory Bird Treaty with Canada, Mexico and Japan makes it unlawful to take, possess, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter, any migratory bird, or the parts, nests, or eggs of such a bird except under the terms of a valid Federal permit. The federal Migratory Bird Treaty Act (MBTA) applies to the removal of nests occupied by migratory birds during the breeding season.

2.1.6 California Fish and Game Code

Section 3503

Section 3503 of the CFGC prohibit the take, possession, or needlessly destruction of a nest or eggs of any bird, except as otherwise provided by CFGC or any regulation made pursuant thereto.

2.1.7 Executive Order 13112 – Invasive Species

On February 3, 1999, President William J. Clinton signed Executive Order (EO) 13112 requiring federal agencies to combat the introduction or spread of invasive species in the United States. The order defines invasive species as "any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem whose introduction does or is likely to cause economic or environmental harm or harm to human health." Federal Highway Administration guidance issued August 10, 1999 directs the use of the State's invasive species list, maintained by the California Invasive Species Council (ISCC) to define the invasive plants that must be considered as part of the National Environmental Policy Act (NEPA) analysis for a proposed project.

2.2 Studies Required

2.3 Literature and Database Review

Biological resources and potential impacts were identified through a literature and database review. A literature review was used to develop a list of special-status plant and wildlife species and natural communities. For purposes of this evaluation, special-status species are those that are listed under or included in:

- the federal ESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species;
- the California Endangered Species Act (CESA) as threatened, endangered, rare, or a candidate species;
- the California Native Plant Society (CNPS)'s California Rare Plant Rank (CRPR) designations as rare or endangered with ranks of 1A, 1B, 2A, 2B, or 3;
- Designated by CDFW as a California species of special concern; or
- Listed in the California Fish and Game (F&G) Code as a fully protected species (birds at Section 3511, mammals at Section 4700, reptiles and amphibians at Section 5050, and fish at Section 5515).

The following data sources on special-status species were queried:

- USFWS list of federally endangered and threatened species that may occur in the proposed Project, and/or may be affected by the proposed Project (USFWS 2022a);
- USFWS's Critical Habitat Portal (USFWS 2022b);
- National Wetland Inventory (NWI) results (USFWS 2022c);
- California Department of Fish and Wildlife's California Natural Diversity Database (CNDDB) queries for the nine U.S. Geological Survey (USGS) 7.5-minute Quadrangles surrounding and encompassing the BSA (Tracy, Veralis, Lathrop, Union Island, Clifton Court Forebay, Midway, Cedar Mountain, Lone Tree Creek, and Solyo);
- CNPS Inventory of Rare and Endangered Plants of California queries for the for the nine USGS 7.5-minute Quadrangles surrounding and encompassing the BSA; and
- eBird records for the study area (Cornell Lab of Ornithology 2022).

Results from the database queries are provided in **Appendix B**. A NMFS species list is not required, as the Proposed Project is outside of NMFS jurisdiction. Based on the results of the searches, preliminary field surveys were then conducted to evaluate the listed special-status plants, wildlife, and fish species and their potential to occur within the BSA, included in **Appendix C.**

Maps of existing biological resources, including an aerial photographic overview of the BSA (Figure 1), CNDDB special-status species occurrence records within five miles of the BSA (Figures 2 and 3), and critical habitat (Figure 4), were created based on the literature review. No critical habitat is present within the BSA.

2.4 Field Reviews

2.4.1 Survey Methods and Dates

Previous Surveys

Three surveys were conducted in 2018 for the Corral Hollow Road Widening Phase 2 Linne Road to I-580 Project. This road widening project overlaps the Proposed Project along Corral Hollow Road, and within the orchard. These surveys were conducted by Steve McMurtry of De Novo Planning Group to evaluate biological conditions within the project area (De Novo Planning Group 2020).

Current Survey

Horizon biologists Robin Hunter and Erica Caddell conducted a reconnaissance survey of the BSA on May 2, 2022. The survey was conducted on-foot in all accessible areas within BSA. Natural and anthropogenic features, land cover types, and the presence of common and special-status species were visually surveyed. Visual aids, such as binoculars, were used to better assess survey areas and wildlife species when appropriate.

2.5 Agency Coordination and Professional Contacts

No coordination with regulatory agencies has occurred.

3 Biological Study Area Description

3.1 Environmental Setting

3.1.1 Physical Conditions

Topography

Topography in the vicinity of the BSA is largely flat. Elevations in the BSA range from approximately 160-170 feet above mean sea level, sloping up towards the southwest (USGS 1981).

Climate

The study area has a Mediterranean climate characterized by cool, wet winters and hot, dry summers. Average temperatures range from a low of 36 degrees Fahrenheit (°F) in January to a high of 85°F in July (Natural Resources Conservation Service [NRCS] 2022a). Average annual precipitation is approximately 9.9 inches, with the majority of precipitation occurring from October through April (NRCS 2022a).

Soils

The Project area is underlain by Zacharias clay loam, 0 to 2 percent slopes (NRCS 2022b). This soil is not classified as a hydric soil (NRCS 2022c).

3.1.2 Land Use

The land uses in the vicinity of the BSA consist of a mix of agriculture, industrial, residential, and infrastructure (canals and airport). Residential uses are dominant to the north as new development is expanding southerly from the main City center. Residential development is located to the northwest of the Project site and additional homes are under construction. Further to the northwest the primary land use is agricultural production. To the southeast, south, and southwest, the Project is surrounded by a mix of land uses. This includes industrial uses for concrete production, the Tracy Municipal Airport, American Legion Park, the Tracy Water Treatment Plan, the northerly reach of the Delta Mendota Canal, and agricultural land.

Adjacent land uses to the north of Linne Road include highly disturbed roadway shoulder and the UPRR. This area is nearly devoid of vegetation and does not contain any structures. To the south of Linne Road is an industrial site with numerous buildings used for sand and gravel operations and manufacturing concrete products. To the southeast of the corner of Linne Road and Corral Hollow Road is a lot that is partially developed with three small single-story structures. The westerly side of this lot is adjacent to the eastern alignment of Corral Hollow Road. The northerly portion of the lot contains an undeveloped but disturbed area with an existing billboard. The southerly half of this parcel contains three structures. To the west of Corral Hollow Road is agricultural land that is cultivated with an orchard. There are above ground power lines strung on wooden power poles along both the southerly sides of Linne Road and the easterly side of Corral Hollow Road.

3.2 Biological Resources

3.2.1 Land Cover Types

This section describes habitats and land cover present within the BSA. The reconnaissance survey identified four land cover types in the study area: developed, landscaped, orchard, and ruderal. Vegetation within the study area was surveyed on foot. Botanical nomenclature follows the second edition of the Jepson Manual (Baldwin et al. 2012). The characteristics of each land cover type are described below.

Developed

Developed land cover includes W. Linne Road, Corral Hollow Road, adjacent driveways, and the UPRR tracks. Vegetation in these areas, if present at all, is usually sparse and dominated by opportunistic weedy herbaceous species. Wildlife species typically associated with developed areas include striped skunk (*Mephitis mephitis*), raccoon (*Procyon lotor*), and Virginia opossum (*Didelphis virginiana*).

Landscaped

Landscaped areas of the BSA are characterized by ornamental vegetation. Due to its close proximity to the more expansive developed areas, wildlife associated with landscaped vegetation is the same as associated developed cover.

Orchard

An almond (*Prunus dulcis*) orchard is present in the western portion of the BSA. The understory vegetation that would provide food and cover for wildlife is sparse in this orchard, limiting the abundance and diversity of wildlife species that may be found there. Species such as the side-blotched lizard (*Uta stansburiana*), pocket gopher (*Thomomys bottae*), squirrel (*Citellus* spp.), and western brush rabbit (*Sylvilagus bachmani*) can occur in this habitat type.

Ruderal

Ruderal vegetation is characterized by non-native forbs and grasses in a disturbed habitat typically along the edges of development or areas with frequent anthropogenic impacts (e.g., mowing/discing). This vegetation type is present to the north of the orchard and in the disced field located to the southeast of the intersection.

3.2.2 Aquatic resources

No aquatic resources were present within the BSA. A rock-lined constructed detention basin is located just outside the BA, to the northwest of the intersection.

3.2.3 Invasive species

Table 2 identifies the invasive species observed in BSA during the field survey. The species listed in the table were observed at numerous locations in the BSA and are considered invasive based on the ISCC invasive plant species list.

Table 1: Invasive Species Observed in the BSA

Scientific Name	Common Name	Cal-IPC Ranking*
Bromus madritensis ssp. rubens	red brome	High
Carduus pycnocephalus	Italian thistle	Moderate
Centaurea solstitialis	yellow star thistle	High
Convolvulus arvensis	field bindweed	Not listed
Festuca perennis	Italian ryegrass	Moderate
Hordeum murinum	Foxtail barley	Moderate
Lactuca serriola	Prickly lettuce	Not listed
Malva parviflora	Cheeseweed mallow	Not listed

* California Invasive Plant Council (Cal-IPC) ranking for ecological impacts.

3.2.4 Habitat Connectivity

Habitat within and in the vicinity of the BSA is largely isolated, and connectivity is substantially restricted due to the surrounding land uses. The BSA is largely developed, landscaped, disturbed, or in orchard cultivation. The overall degree of noise and human presence and activity within and adjacent to the BSA further reduces the quality of habitat within the BSA.

3.3 Special-Status Species

3.3.1 Plants

Special-status plants known to occur in the vicinity of the BSA were evaluated for their potential to occur (**Appendix C**). No special-status plants are anticipated to occur in the BSA.

3.3.2 Wildlife

Special-status wildlife known to occur in the vicinity of the BSA were evaluated for their potential to occur are described in detail in Appendix C and summarized below. Additional detail is provided in Chapter 4.

San Joaquin kit fox (*Vulpes macrotis mutica*) is known to occur in the vicinity of the BSA (Figure 3). Burrowing owl (*Athene cunicularia*) and Swainson's hawk (*Buteo swainsoni*) are known to occur at several locations within 5 miles of the Proposed Project (Figure 3). A Swainson's hawk was also observed perching on a power pole in the BSA during the May reconnaissance survey.

Several species of special-status bats may forage over the BSA, including pallid bat (*Antrozous pallidus*), Townsend's big-eared bat (*Corynorhinus townsendii*), and western mastiff bat (*Eumops perotis californicus*).

3.3.3 Critical Habitat

No Critical Habitat is designated within the study area (USFWS 2022b).

3.4 Regional Species and Habitats and Natural Communities of Concern

This section describes special-status species, their habitats, their potential to occur within the BSA. Table 3 includes the species that have potential to occur in the BSA. Complete lists of all special-status plant, wildlife, and fish species considered are included in Appendix C.

Table 2: Species with Potential to Occur.

Scientific Name **Common Name**	**Status (Federal / State)**	**General Habitat Description**	**Potential to Occur at the Project Site** **Effect Finding for Federally Listed Species**
Vulpes macrotis mutica San Joaquin kit fox	FE/ST	Annual grasslands or grassy open stages with scattered shrubby vegetation. Needs loose-textured sandy soils for burrowing and suitable prey base.	**May occur.** No dens were observed during the May 2022 reconnaissance survey; however, this species is known from the vicinity of the BSA and could travel through the BSA. **May affect, not likely to adversely affect.**
Buteo swainsoni Swainson's Hawk	-/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	**Present.** Potentially suitable foraging habitat is present in the vicinity of the BSA. This species is not anticipated to nest within the BSA, but may nest in the vicinity. No suitable nest trees are present within the BSA. One individual observed perching in the BSA during the May 2022 reconnaissance survey.
Athene cunicularia burrowing owl	-/SCC	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	**May occur.** Potentially suitable foraging habitat is present and there are known CNDDB occurrences within 5 miles of the BSA (CDFW 2022). The BSA is not anticipated to provide suitable nesting habitat due to the lack of burrows observed during May 2022 reconnaissance survey.

Scientific Name **Common Name**	**Status (Federal / State)**	**General Habitat Description**	**Potential to Occur at the Project Site** **Effect Finding for Federally Listed Species**
Antrozous pallidus pallid bat	-/SSC	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**Possible.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Corynorhinus townsendii Townsend's big-eared bat	-/SCC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. This species generally roosts in caves, abandoned mines, and occasionally buildings and is extremely sensitive to human disturbance (Pierson and Rainey 1998).	**May occur.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Eumops perotis californicus western mastiff bat	-/SSC	Many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	**May occur.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.

Status Legend

Federal:

FE = federally listed as endangered

- = no listing status

State

ST = state threatened

SSC = species of special concern

4 Results: Biological Resources, Discussion of Impacts and Mitigation

4.1 Habitats and Natural Communities of Special Concern

Natural communities of special concern include those that are regulated by federal, state, or local jurisdictions, have limited distributions, and/or support populations of special-status plants or wildlife. Federal and state agencies also consider wetlands and waters of the United States as features of special concern. No natural communities of special concern, wetlands, or waters of the United States were identified within the BSA. Therefore, no impacts would occur.

4.2 Critical Habitat

USFWS and NMFS designated critical habitat to protect areas that are essential to the survival of federally listed species of plants and wildlife. No critical habitat is present within the BSA. Therefore, no impacts would occur.

4.3 Special Status Plant Species

Many special-status plant species were identified by the CNDDB, CNPS, and USFWS databases as having potential to occur in the region (see Appendix B). However, no special-status plant species are expected to occur in the BSA due to the lack of suitable habitat. No special-status plant species were observed during the biological reconnaissance-level survey, or in previous surveys conducted within the BSA. Since special-status plant species are not expected to occur within the BSA, the Project would not impact any special-status plants.

4.4 Special Status Animal Species

The CNDDB and USFWS databases identified special-status wildlife species that have potential to occur in the region (see Appendix B). Based on the observations made during the biological reconnaissance-level surveys, all but eight species were determined to have no potential or were not expected to occur within the BSA due to the lack of suitable habitat. The special-status species with potential to occur include San Joaquin kit fox, Swainson's hawk, burrowing owl, pallid bat, Townsend's big-eared bat, and western mastiff bat.

4.4.1 San Joaquin Kit Fox

Survey Results

The BSA is mainly comprised of roadways and orchard. These areas may be utilized by San Joaquin kit fox for dispersal and occasional foraging, but are generally not suitable for extended periods of occupation (USFWS 2010). No dens were observed during reconnaissance surveys. Due to the very limited extent of suitable habitat, this species is considered unlikely to occur in the BSA.

Project Impacts

Although it is unlikely that San Joaquin kit fox would occur within the BSA, construction activities could create temporary barriers to movement and dispersal of this species.

Avoidance and Minimization Efforts

Potential impacts to San Joaquin kit fox would be minimized by implementing Avoidance and Minimization Measure (AMM)-1, which requires pre-construction surveys for San Joaquin kit fox dens and additional avoidance or minimization measures.

AMM-1: Avoid and Minimize Impacts to San Joaquin kit fox:

- A qualified biologist will conduct preconstruction surveys no less than 14 days and no more than 30 days before the commencement of activities to identify potential dens more than 5 inches in diameter within 200 feet of ground disturbing activities. The City will implement USFWS' (2011) Standardized Recommendations for Protection of San Joaquin Kit Fox Prior to or During Ground Disturbance. The City will notify USFWS in writing of the results of the preconstruction survey within 30 days after these activities are completed.
- If potential dens are located within the proposed work area and cannot be avoided during construction activities, a USFWS-approved biologist will determine if the dens are occupied. If occupied dens are present within the proposed work, their disturbance will be avoided. Exclusion zones will be implemented following the most current USFWS procedures (currently USFWS 2011). The City will notify USFWS immediately if a natal or pupping den is found in the survey area, and will present the results of pre-activity den searches within 5 days after these activities are completed and before the start of construction activities in the area.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to San Joaquin kit fox would be avoided through the implementation of AMM-1.

4.4.2 Swainson's Hawk

Survey Results

A Swainson's hawk was observed perching on a power pole in the BSA during the May reconnaissance survey. No suitable nesting habitat for this species is present within the BSA. Marginally suitable nesting habitat is present in the tree located to the northeast of the intersection of Corral Hollow Road and the Delta Mendota Canal, to the southeast of the BSA. Trees that provide marginally suitable nesting habitat area also present in the residential development to the north of W. Linne Road. This species may also forage within or adjacent to the BSA.

Project Impacts

Although no nesting habitat is present within the BSA, this species could nest in the marginally suitable habitat that is present within ½ mile of the BSA. Construction could disturb nesting Swainson's hawk through generation of noise or visual distraction. No suitable nesting habitat would be removed by the Project.

The Project would not remove foraging habitat for Swainson's hawk, but would result in temporary noise and visual disturbance during construction that could cause these species to avoid foraging within or adjacent to the BSA. Due to the large amount of foraging habitat available in the region, this would not be a significant impact.

Avoidance and Minimization Efforts

Implementation of AMM-2 would minimize impacts on Swainson's hawk.

> **AMM-2: Conduct Swainson's Hawk Surveys**
>
> If construction occurs between February 1 and August 31, the City or its contractor(s) shall require that a qualified biologist conduct surveys no more than 10 days before the start of construction for Swainson's hawk in accordance with the recommended timing and methodology developed by the Swainson's Hawk Technical Advisory Committee (2000 or most recent). Surveys will cover a minimum ½-mile radius around the construction area. If nesting Swainson's hawk are detected, buffers shall be established around active nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active nests will be ½ mile unless a qualified biologist determines, based on a site-specific evaluation, that a smaller buffer is sufficient to avoid impacts on nesting raptors. Factors to be considered when determining buffer size include the presence of natural buffers provided by vegetation or topography, nest height, locations of foraging territory, and baseline levels of noise and human activity. Buffers shall be maintained until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to Swainson's hawk would be avoided through the implementation of AMM-2.

4.4.3 Burrowing Owl

Survey Results

No burrows potentially suitable for burrowing owl were observed during reconnaissance surveys, and no burrowing owls, whitewash, or other evidence of occupation by burrowing owls was observed. Burrowing owl could forage within the vicinity of the BSA. However, this species may disperse and colonize suitable habitat within the BSA.

Project Impacts

If present in the vicinity of the BSA, construction could disturb burrowing owls through noise, visual distraction, or direct impacts to occupied habitat.

Avoidance and Minimization Efforts

Implementation of AMM 3 would minimize the potential for impacts on burrowing owls

> **AMM-3: Nesting Bird Avoidance:**
>
> To the extent feasible, construction activities should be scheduled to avoid the nesting season. If Project activities are scheduled to take place outside the nesting season, impacts to nesting

birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Joaquin County extends from February 1 through August 31. If it is not possible to schedule Project activities outside the nesting season, then the following measures will be implemented:

- A qualified biologist will conduct pre-construction surveys for nesting birds. These surveys shall be conducted no more than seven days prior to the initiation of Project activities, including tree and vegetation removal. During these surveys, the biologist shall inspect all trees and other potential nesting habitats (e.g., shrubs, ruderal areas, burrows, and structures) in and immediately adjacent to the construction areas for nests.
- If an active nest is found sufficiently close to work areas to be disturbed by these activities, a non-disturbance buffer zone will be established around the nest at the biologist's discretion and in accordance with regulatory permits and conditions to ensure that no nests of special-status species or species protected by the MBTA and California Fish and Game Code shall be disturbed during Project implementation. Buffers zones will remain until the birds have fledged or the nest is no longer active as determined by a qualified biologist.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to burrowing owl would be avoided through the implementation of AMM-3.

4.4.4 Special-status Bats

Survey Results

Several species of special-status bats may forage over the BSA, including pallid bat, Townsend's big-eared bat, and western mastiff bat. Suitable roosting habitat for these species is not present within the BSA.

Project Impacts

Construction of the Project is anticipated to have minimal impacts on bat foraging, and no impacts on bat roosting. Therefore, impacts would not be significant and no avoidance or minimization measures or compensatory mitigation would be required.

4.5 Nesting Birds

Migratory birds and their occupied nests, young, and eggs are protected under federal and state laws. The BSA and immediately surrounding area includes a few trees and shrubs that provide suitable nesting habitat for a variety of bird species protected under the CFGC and the MBTA.

4.5.1 Survey Results

Two inactive nest structures were observed in a shrub within the BSA during the May 2022 survey. Trees and shrubs within and adjacent to the BSA provide suitable nesting substrate for bird species protected by MBTA.

4.5.2 Project Impacts

Impacts to active nests belonging to MBTA- and CFGC-protected bird species could occur throughout the BSA and immediately surrounding nesting substrate from construction activities. Indirect effects including project-related noise and vibration generated from nearby construction activities may disrupt nesting activity or nest fitness that could result in nest abandonment, potentially to the point of nestling mortality. Suitable nesting substrate occurs in shrubs and trees in and surrounding the BSA, and MBTA-protected bird species could nest within and adjacent to the BSA. Therefore, active nests of MBTA-protected species could be impacted by the Project.

4.5.3 Compensatory Mitigation

No compensatory mitigation is necessary because impacts to nesting birds would be avoided through the implementation of AMM-3.

4.5.4 Avoidance and Minimization Efforts

Active bird nests protected by CFGC sections 3503 and 3503.5, as well as the MBTA will be avoided through the implementation of AMM-3

5 Summary and Conclusions

5.1 Federal Endangered Species Act Consultation Summary

Horizon biologists obtained a USFWS list of federally listed species potentially occurring in the BSA and vicinity on April 27, 2022, available in **Appendix B**. Additionally, the biologists obtained CNDDB and CNPS lists of special-status species occurrences in the BSA and surrounding vicinity, including federally listed species, prior to biological surveys. No other coordination with USFWS has occurred. This Project is located outside of NMFS jurisdiction; therefore, a NMFS species list is not required and no effects to NMFS species would occur.

Evaluations of federally listed species resulted in one species with a "may affect, but not likely to adversely affect" determination. The Project may affect, but is not likely to adversely affect San Joaquin kit fox. AMMs are proposed that would avoid and minimize effects on San Joaquin kit fox resulting from construction of the Project. No other federally-listed species will be impacted by this Project. Full species tables are provided in **Appendix C**. No coordination with U.S. Fish and Wildlife Service has occurred.

5.2 Essential Fish Habitat Consultation Summary

No Essential Fish Habitat is present within the BSA. Therefore, no impacts would occur.

5.3 California Endangered Species Act Consultation Summary

Swainson's hawk is listed as threatened under CESA, and was observed within the BSA. With implementation of AMMs, the Project would not impact CESA-listed species. Therefore, an Incidental Take Permit is not required. No consultation with CDFW has occurred to date.

5.4 Wetlands and Other Waters Coordination Summary

No wetlands or other waters are present within the BSA; therefore, no coordination is required.

5.5 Other

5.5.1 Migratory Bird Treaty Act

The Migratory Bird Treaty Act protects migratory bird nests from disturbances that leads to nest abandonment and/or loss of nest success. CFGC sections 3503 and 3503.5 also protect active bird nests from being taken, possessed, or needlessly destroyed. Birds have potential to nest within trees and structures within the BSA; however, the implementation of AMM-3 ensures that active nests are avoided by project-related disturbance. Project activities will avoid the nesting season (February 1 to August 31) to the extent feasible. Should Project activities be required to occur during the nesting season, a pre-construction survey will identify active nests and establish no disturbance buffers. Therefore, the Project will have no effect on active bird nests protected by the MBTA or CFGC section 3503 and 3503.5.

Site Photographs

Appendix A. Site Photographs

Photo No. 1	Date: 5/2/2022

Description:
The Biological Study Area (BSA) facing west and on the south side of W. Linne Road. A recently disced field shown to the left of the white fence.

Photo No. 2	Date: 5/2/2022

Description:
BSA, facing north and on the west side of Corral Hollow Road. An almond (*Prunus dulcis*) orchard pictured here spans the western side and stops at the intersection of W. Linne Road and Corral Hollow Road. Small burrows were identified along the berm pictured here on the left, parallel to Corral Hollow Road.

Appendix A. Site Photographs

Photo No. 3	Date: 5/2/2022

Description:
BSA, facing west and on the north side of W. Linne Road. Photo taken from the the BSA northeastern boundary line. Developed land cover dominates this area with sparse opportunistic weedy herbaceous species (not pictured) further east.

Photo No. 4	Date: 5/2/2022

Description:
BSA, facing west and on the south side of W. Linne Road. View from from near the BSA southeastern boundary line. Landscaped area of the BSA pictured here on the left.

Appendix A. Site Photographs

Photo No. 5	Date: 5/2/2022

Description: BSA, facing west and to the northwest of the intersection. This photo shows a rock-lined constructed detentioin basin visible in the foreground, just outside the BSA limits. No aquatic recources were present within the BSA.

Photo No. 6	Date: 5/2/2022

Description: BSA, facing west. An almond (*Prunus dulcis*) orchard visible on the left runs along the southwestern portion of the BSA, and north of the intersection.

Appendix B
USFWS, CNPS, and CNDDB Species Lists

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Sacramento, CA 95825-1846

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern https://www.fws.gov/program/migratory-birds/species
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your

project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Common Yellowthroat *Geothlypis trichas sinuosa* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/2084	Breeds May 20 to Jul 31
Golden Eagle *Aquila chrysaetos* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31
Nuttall's Woodpecker *Picoides nuttallii* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9410	Breeds Apr 1 to Jul 20

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Yellow-billed Magpie Pica nuttalli — Breeds Apr 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9726

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

NOT FOR CONSULTATION

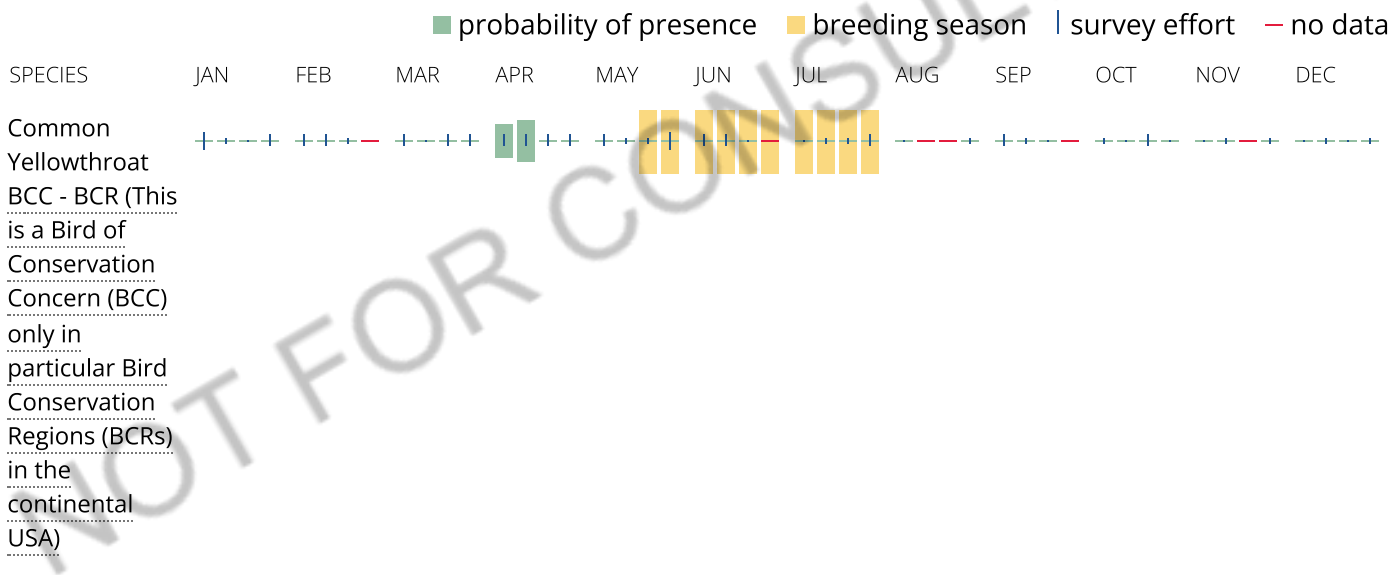
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

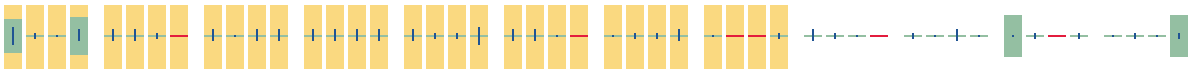
No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

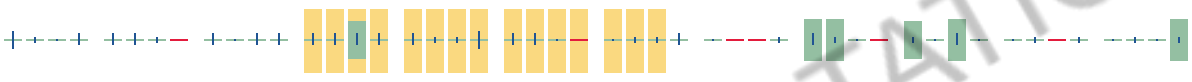


NOT FOR CONSULTATION

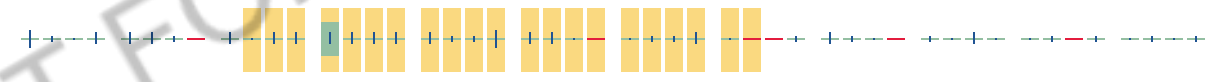
Golden Eagle Non-BCC Vulnerable (This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.)



Nuttall's Woodpecker BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

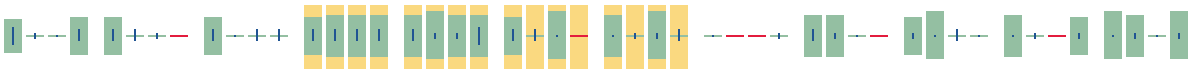


Tricolored Blackbird BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



NOT FOR CONSULTATION

Yellow-billed Magpie BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

NOT FOR CONSULTATION

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

NOT FOR CONSULTATION

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

WETLAND INFORMATION IS NOT AVAILABLE AT THIS TIME

This can happen when the National Wetlands Inventory (NWI) map service is unavailable, or for very large projects that intersect many wetland areas. Try again, or visit the NWI map to view wetlands at this location.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Appendix C
Special-status Species Tables

Appendix C: Special-status Species Tables

Table C-1: Special-status Plants

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Amsinckia grandiflora large-flowered fiddleneck	FE/SE/1B.1	Cismontane woodland, valley and foothill grassland. Annual grassland in various soils. 275-550 meters.	None. Suitable habitat is not present in the BSA
Allium sharsmithiae Sharsmith's onion	-/-/1B.3	Chaparral, Cismontane woodland, ultramafic. Rocky, serpentine slopes. 425-975 meters.	None. Suitable habitat is not present in the BSA
Atriplex cordulata var. cordulata heartscale	-/-/1B.2	Chenopod scrub, valley and foothill grassland, meadows. Alkaline flats and scalds in the Central Valley, sandy soils. 0-560 meters. Blooms April to October.	None. Suitable habitat is not present in the BSA
Astragalus tener var. tener Alkali milk-vetch	-/-/1B.2	Alkali playa, valley and foothill grassland, vernal pools. Low ground, alkali flats, and flooded lands; in annual grassland or in playas or vernal pools. 0-170 meters.	None. Suitable habitat is not present in the BSA
Blepharizonia plumosa big tarplant	-/-/1B.1	Valley and foothill grassland. Dry hills and plains in annual grassland. Clay to clay-loam soils; usually on slopes and often in burned areas. 30-505 meters. Blooms July to October.	Not expected. Marginally suitable habitat is present in the BSA.
Campanula exigua chaparral harebell	-/-/1B.2	Chaparral. Rocky sites, usually on serpentine in chaparral. 90-1375 m.	None. Suitable habitat is not present in the BSA.
Caulanthus lemmonii Lemmon's jewelflower	-/-/1B.2	Pinyon and juniper woodland, valley and foothill grassland. 75-1,585 meters. Blooms February to May.	None. Suitable habitat is not present in the BSA.
Centromadia parryi ssp. Congdonii Congdon's tarplant	-/-/1B.1	Valley & foothill grassland. Alkaline soils, sometimes described as heavy white clay. 0-245 m.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Chlorogalum pomeridianum var. minus dwarf soaproot	-/-/1B.2	Chaparral. Serpentine. 120-1220 m.	None. Suitable habitat is not present in the BSA.
Cirsium crassicaule slough thistle	-/-/1B.1	Chenopod scrub, marshes and swamps, riparian scrub. Sloughs, riverbanks, and marshy areas. 3-95 m.	None. Suitable habitat is not present in the BSA.
Cirsium fontinale var. campylon Mt. Hamilton thistle	-/-/1B.2	Cismontane woodland, chaparral, valley and foothill grassland. In seasonal and perennial drainages on serpentine. 75-890 m.	None. Suitable habitat is not present in the BSA.
Delphinium californicum ssp. Interius Hospital Canyon larkspur	-/-/1B.2	Cismontane woodland, chaparral, coastal scrub. In wet, boggy meadows, openings in chaparral and in canyons. 195-1095 m.	None. Suitable habitat is not present in the BSA.
Delphinium recurvatum Recurved larkspur	-/-/1B.2	Chenopod scrub, valley and foothill grassland, cismontane woodland. On alkaline soils; often in valley saltbush or valley chenopod scrub. 3-790 m.	None. Suitable habitat is not present in the BSA.
Eriastrum tracyi Tracy's eriastrum	-/SR/3.2	Chaparral, cismontane woodland, valley and foothill grassland. Gravelly shale or clay; often in open areas. 315-2400 m.	None. Suitable habitat is not present in the BSA.
Eryngium racemosum Delta button-celery	-/SE/1B.1	Riparian scrub. Seasonally inundated floodplain on clay. 3-75 meters. Blooms June to October.	None. Suitable habitat is not present in the BSA.
Eryngium spinosepalum Spiny-sepaled button-celery	-/-/1B.2	Vernal pools, valley and foothill grassland. Some sites on clay soil of granitic origin; vernal pools, within grassland. 15-1270 m.	None. Suitable habitat is not present in the BSA.
Eschscholzia rhombipetala diamond-petaled California poppy	-/-/1B.1	Valley and foothill grassland. Alkaline, clay slopes and flats. 30-625 meters. Blooms March to April.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Extriplex joaquinana San Joaquin spearscale	-/-/1B.2	Chenopod scrub, alkali meadow, playas, valley and foothill grassland. In seasonal alkali wetlands or alkali sink scrub with Distichlis spicata, Frankenia, etc. 0-800 m.	None. Suitable habitat is not present in the BSA.
Fritillaria falcata Talus fritillary	-/-/1B.2	Chaparral, cismontane woodland, lower montane coniferous forest. Mostly on serpentine talus, but occasionally found on granitics. 425-1435 m.	None. Suitable habitat is not present in the BSA.
Helianthella castanea Diablo helianthella	-/-/1B.2	Broadleafed upland forest, chaparral, cismontane woodland, coastal scrub, riparian woodland, valley and foothill grassland. Usually in chaparral/oak woodland interface in rocky, azonal soils. Often in partial shade. 45-1070 m.	None. Suitable habitat is not present in the BSA.
Hesperolinon breweri Brewer's western flax	-/-/1B.2	Chaparral, cismontane woodland, valley and foothill grassland. Often in rocky serpentine soil in serpentine chaparral and serpentine grassland. 195-910 m.	None. Suitable habitat is not present in the BSA.
Hibiscus lasiocarpos var. occidentalis woolly rose-mallow	-/-/1B.2	Marshes and swamps (freshwater). Moist, freshwater-soaked river banks and low peat islands in sloughs; can also occur on riprap and levees. In California, known from the delta watershed. 0-155 m.	None. Suitable habitat is not present in the BSA.
Hoita strobilina Loma Prieta hoita	-/-/1B.1	Chaparral, cismontane woodland, riparian woodland. Serpentine; mesic sites. 60-975 m.	None. Suitable habitat is not present in the BSA.
Leptosyne hamiltonii Mt. Hamilton coreopsis	-/-/1B.2	Cismontane woodland. On steep shale talus with open southwestern exposure. 535-1280 m.	None. Suitable habitat is not present in the BSA.
Lilaeopsis masonii Mason's lilaeopsis	-/-/1B.1	Marshes and swamps, riparian scrub. Tidal zones, in muddy or silty soil formed through river deposition or river bank erosion. In brackish or freshwater. 0-10 m.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Limosella australis Delta mudwort	-/-/2B.1	Riparian scrub, marshes and swamps. Usually on mud banks of the Delta in marshy or scrubby riparian associations; often with *Lilaeopsis masonii*. 0-5 m.	None. Suitable habitat is not present in the BSA.
Madia radiata showy golden madia	-/-/1B.1	Valley and foothill grassland, cismontane woodland. Mostly on adobe clay in grassland or among shrubs. 75-1220 m.	None. Suitable habitat is not present in the BSA.
Malacothamnus hallii Hall's bush-mallow	-/-/1B.2	Chaparral, coastal scrub. Some populations on serpentine. 10-735 m.	None. Suitable habitat is not present in the BSA.
Micropus amphibolus Mt. Diablo cottonweed	-/-/3.2	Valley and foothill grassland, cismontane woodland, chaparral, broadleafed upland forest. Bare, grassy or rocky slopes. 45-825 m.	None. Suitable habitat is not present in the BSA.
Navarretia nigelliformis ssp. radians shining navarretia	-/-/1B.2	Cismontane woodland, valley and foothill grassland, vernal pools. Apparently in grassland, and not necessarily in vernal pools. 60-975 m.	None. Suitable habitat is not present in the BSA.
Phacelia phacelioides Mt. Diablo phacelia	-/-/1B.2	Chaparral, cismontane woodland. Adjacent to trails, on rock outcrops and talus slopes; sometimes on serpentine. 605-1345 m.	None. Suitable habitat is not present in the BSA.
Puccinellia simplex California alkali grass	-/-/1B.2	Meadows and seeps, chenopod scrub, valley and foothill grasslands, vernal pools. Alkaline, vernally mesic. Sinks, flats, and lake margins. 1-915 meters. Blooms March to May	None. Suitable habitat is not present in the BSA.
Senecio aphanactis Chaparral ragwort	-/-/2B.2	Chaparral, cismontane woodland, coastal scrub. Drying alkaline flats. 20-1020 m.	None. Suitable habitat is not present in the BSA.
Spergularia macrotheca var. longistyla Long-styled sand-spurrey	-/-/1B.2	Marshes and swamps, meadows and seeps. Alkaline. 0-220 m.	None. Suitable habitat is not present in the BSA.

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Trichocoronis wrightii var. wrightii Wright's trichocoronis	-/-/2B.1	Marshes and swamps, riparian forest, meadows and seeps, vernal pools. Mud flats of vernal lakes, drying river beds, alkali meadows. 5-435 m.	None. Suitable habitat is not present in the BSA.
Tropidocarpum capparideum Caper-fruited tropidocarpum	-/-/1B.1	Valley and foothill grassland. Alkaline clay. 0-360 m.	None. Suitable habitat is not present in the BSA.

Status Legend

Federal:

FE = federally listed as endangered

FT = federally listed as threatened

- = no listing status

State:

SE = state listed as endangered

SR = state designated as rare

CRPR (California Rare Plant Rank):

1B = Plants Rare, Threatened, or Endangered in California and Elsewhere

2B = Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3 = Plants about which more information is needed, a review list

Threat Ranks =

0.1 = Seriously threatened in California

0.2 = Moderately threatened in California

Table C-2. Special-status Animal Species

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Invertebrates			
Branchinecta lynchi vernal pool fairy shrimp	FT/-	Endemic to the grasslands of the Central Valley, Central Coast mountains, and South Coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	**None.** Suitable habitat is not present in the BSA.
Danaus plexippus monarch butterfly	SC	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby. Closed-cone coniferous forest.	**None.** Suitable habitat is not present in the BSA.
Desmocerus californicus dimorphus valley elderberry longhorn beetle	FT/-	Occurs only in the Central Valley of California, in association with blue elderberry (*Sambucus mexicana*). Prefers to lay eggs in elderberries 2-8 inches in diameter; some preference shown for "stressed" elderberries.	**None.** Suitable habitat is not present in the BSA. No elderberry plants are present.
Lepidurus packardi vernal pool tadpole shrimp	FE/-	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass-bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	**None.** Suitable habitat is not present in the BSA.
Amphibians and Reptiles			
Ambystoma californiense California tiger salamander	FT/ST, SSC	Central Valley distinct population segment (DPS) federally listed as threatened. Santa Barbara and Sonoma County DPS federally listed as endangered. Need underground refuges, especially ground squirrel burrows, and vernal pools or other seasonal water sources for breeding.	**Not expected.** Suitable aquatic habitat is not present in the BSA. The BSA is greater than 1.3 miles (migratory distance) from known occurrences of this species.
Anniella pulchra Northern California legless lizard	-/SSC	Sandy or loose loamy soils under sparse vegetation. Soil moisture is essential. They prefer soils with a high moisture content.	**None.** Suitable habitat is not present in the BSA.
Arizona elegans occidentalis California glossy snake	SSC	Patchily distributed from the eastern portion of San Francisco Bay, southern San Joaquin Valley, and the Coast, Transverse, and Peninsular	**None.** Suitable habitat is not present in the BSA.

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
		ranges, south to Baja California. Generalist reported from a range of scrub and grassland habitats, often with loose or sandy soils.	
Emys marmorata western pond turtle	-/SSC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation, below 1,830 meters elevation. Need basking sites and suitable upland habitat (sandy banks or grassy open fields) up to 0.5 kilometer from water for egg-laying.	None. Suitable habitat is not present in the BSA.
Masticophis flagellum ruddocki San Joaquin coachwhip	-/-/SSC	Open, dry habitats with little or no tree cover. Found in valley grassland and saltbush scrub in the San Joaquin Valley. Needs mammal burrows for refuge and oviposition sites.	Not expected. Marginally suitable habitat is present in the BSA.
Masticophis lateralis euryxanthus Alameda whipsnake	FT/ST	Typically found in chaparral and scrub habitats but will also use adjacent grassland, oak savanna and woodland habitats. Mostly south-facing slopes and ravines, with rock outcrops, deep crevices or abundant rodent burrows, where shrubs form a vegetative mosaic with oak trees and grasses.	None. Suitable habitat is not present in the BSA.
Phrynosoma blainvillii Coast horned lizard	SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	Not Expected. Marginally suitable habitat is present in the BSA.
Rana draytonii California red-legged frog	FT/SSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	None. Suitable habitat is not present in the BSA.
Spea hammondii Western spadefoot toad	SSC	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	None. Suitable habitat is not present in the BSA.
Thamnophis gigas giant garter snake	FT/ST	Prefers freshwater marsh and low-gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the garter snakes in California.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Birds			
Agelaius tricolor Tricolored Blackbird	-/SC, SSC	Highly colonial species, most numerous in Central Valley and vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few kilometers of the colony.	Not expected. Marginally suitable foraging habitat is present in the vicinity of the BSA. Suitable nesting habitat is not present. CNDDB known occurrences within 5 miles of the BSA (CDFW 2022).
Athene cunicularia burrowing owl	-/SSC	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	Possible. Potentially suitable foraging habitat is present and there are known CNDDB occurrences within 5 miles of the BSA (CDFW 2022). The BSA is not anticipated to provide suitable nesting habitat due to the lack of burrows observed during May 2022 reconnaissance survey.
Ammondramus savannarum Grasshopper sparrow	SSC	Dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs and scattered shrubs. Loosely colonial when nesting.	None. Suitable habitat is not present in the BSA.
Asio flammeus Short-eared owl	SSC	Found in swamp lands, both fresh and salt; lowland meadows; irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.	None. Suitable habitat is not present in the BSA.
Buteo swainsoni Swainson's Hawk	-/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	Present. Potentially suitable foraging habitat is present in the vicinity of the BSA. This species is not anticipated to nest within the BSA, but may nest in the

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
			vicinity. No suitable nest trees are present within the BSA. Observed one individual during reconnaissance survey May 2022.
Circus hudsonius Northern harrier	SSC	Coastal salt and freshwater marsh. Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	None. Suitable habitat is not present in the BSA.
Coccyzus americanus occidentalis Western yellow-billed cuckoo	FT/SE	Riparian forest nester along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.	None. Suitable habitat is not present in the BSA.
Elanus leucurus White-tailed kite	FP	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Not expected. Marginally suitable foraging habitat is present in the vicinity of the BSA. Suitable nesting habitat is not present.
Lanius ludovicianus loggerhead shrike	-/SSC	Broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	Not expected. Marginally suitable foraging habitat is present in the BSA.
Melospiza melodia Song Sparrow ("Modesto" population)	-/SSC	Emergent freshwater marshes, riparian willow thickets, riparian forests, and vegetated irrigation. Inhabits cattails (*Typha* spp.), bulrush (*Schoenoplectus* spp.) and other sedges; also known to frequent tangles bordering sloughs.	None. Suitable habitat is not present in the BSA.
Vireo bellii pusillus Least Bell's Vireo	FE/SE	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 610 meters (2,000 feet). Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, *Baccharis*, mesquite.	None. Suitable habitat is not present in the BSA.
Fish			

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Hypomesus transpacificus Delta smelt	FT/SE	Sacramento–San Joaquin River Delta. Seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay. Seldom found at salinities > 10 parts per thousand; most often at salinities < 2 parts per thousand.	None. Suitable habitat is not present in the BSA.
Oncorhynchus mykiss irideus steelhead – Central Valley DPS	FT/-	Populations in the Sacramento and San Joaquin Rivers and their tributaries.	None. Suitable habitat is not present in the BSA.
Mammals			
Antrozous pallidus Pallid bat	-/SSC	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Corynorhinus townsendii Townsend's big-eared bat	-/SSC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. This species generally roosts in caves, abandoned mines, and occasionally buildings and is extremely sensitive to human disturbance (Pierson and Rainey 1998).	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Eumops perotis californicus western mastiff bat	-/SSC	Many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Neotoma fuscipes riparia riparian (=San Joaquin Valley) woodrat	FE/SSC	Riparian areas along the San Joaquin, Stanislaus, and Tuolumne Rivers. Needs areas with mix of brush and trees. Needs suitable nesting sites in trees, snags, or logs.	None. Suitable habitat is not present in the BSA.
Sylvilagus bachmani riparius riparian brush rabbit	FE/SE	Riparian areas on the San Joaquin River in northern Stanislaus County. Dense thickets of wild rose, willows, and blackberries.	None. Suitable habitat is not present in the BSA.
Taxidea taxus American badger	-/SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	Not Expected. Marginally suitable habitat is present in the BSA. No dens were observed during the reconnaissance survey.

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Vulpes macrotis mutica San Joaquin kit fox	FE/ST	Annual grasslands or grassy open stages with scattered shrubby vegetation. Needs loose-textured sandy soils for burrowing and suitable prey base.	Possible. No dens were observed during the May 2022 reconnaissance survey; however, this species is known from the vicinity of the BSA.

Status Legend

Federal:

FE = federally listed as endangered

FT = federally listed as threatened

- = no listing status

State:

SC = state candidate for listing as threatened or endangered

SE = state listed as endangered

SSC = California species of special concern

Construction Site Well Review (CSWR) ID: 1012667

Assessor Parcel Number(s): 25302012, 24014033, 24401008, 25311020, 25311002, 25311029, 25311030, 24014021, 24402031, 24401007

Property Owner(s): Union Pacific Railway

Project Location Address: Corral Hollow Road and Linne Road Tracy, California 95376

Project Title: 2022110250: Linne Road/Corral Hollow Road Intersection Improvement Project

Public Resources Code (PRC) § 3208.1 establishes well reabandonment responsibility when a previously plugged and abandoned well will be impacted by planned property development or construction activities. Local permitting agencies, property owners, and/or developers should be aware of, and fully understand, that significant and potentially dangerous issues may be associated with development near oil, gas, and geothermal wells.

The California Geologic Energy Management Division (CalGEM) has received and reviewed the above referenced project dated 12/15/2022. To assist local permitting agencies, property owners, and developers in making wise land use decisions regarding potential development near oil, gas, or geothermal wells, the Division provides the following well evaluation.

The project is located in San Joaquin County, within the boundaries of the following fields:

N/A

Our records indicate there are no known oil or gas wells located within the project boundary as identified in the application.

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

As indicated in PRC § 3106, the Division has statutory authority over the drilling, operation, maintenance, and abandonment of oil, gas, and geothermal wells, and attendant facilities, to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil, gas, and geothermal deposits; and damage to underground and surface waters suitable for irrigation or domestic purposes. In addition to the Division's authority to order work on wells pursuant to PRC §§ 3208.1 and 3224, it has authority to issue civil and criminal penalties under PRC §§ 3236, 3236.5, and 3359 for violations within the Division's jurisdictional authority. The Division does not regulate grading, excavations, or other land use issues.

If during development activities, any wells are encountered that were not part of this review, the property owner is expected to immediately notify the Division's construction site well review engineer in the Northern district office, and file for Division review an amended site plan with well casing diagrams. The District office will send a follow-up well evaluation letter to the property owner and local permitting agency.

Should you have any questions, please contact me at (805) 937-7246 or via email at Miguel.Cabrera@conservation.ca.gov.

Sincerely,

Miguel Cabrera
Northern District Deputy

GOVERNOR'S OFFICE OF PLANNING AND RESEARCH
Dec 15 2022
STATE OF CALIFORNIA

COMMENTS TO REQUEST FOR REVIEW FOR THE MITIGATED NEGATIVE DECLARATION, LINNE ROAD/CORRAL HOLLOW ROAD INTERSECTION IMPROVEMENT PROJECT, SCH#2022110250, SAN JOAQUIN COUNTY

Pursuant to the State Clearinghouse's 14 November 2022 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Mitigated Negative Declaration* for the Linne Road/Corral Hollow Road Intersection Improvement Project, located in San Joaquin County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore, our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of

Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at:

https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4684 or Peter.Minkel2@waterboards.ca.gov.

Multiple

Project Description: *(please use a separate page if necessary)*

The proposed project would widen Corral Hollow Road to two (2) travel lanes in each direction starting immediately north of the Union Pacific Railroad (UPRR) right of way (ROW) at W. Linne Road to approximately 500 feet south of the intersection with W. Linne Road. Improvements proposed by the project along Corral Hollow Road in addition to the widening would include the construction of a median, curbs, and sidewalks, the construction of a drainage feature on the west side of the project site, and the installation of new signage and striping. Some ROW acquisition, temporary construction easements, and utility relocation would be required for project implementation. Linne Road would be widened to enable restriping for a single right-turn lane only and left turn only lane for westbound traffic.

New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road, streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal and the pre-signal would be created in coordination with UPRR.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

1 Draft Mitigation Monitoring and Reporting Program

1.1 Public Resources Code

When approving projects with Initial Studies (IS) that identify significant impacts, the California Environmental Quality Act (CEQA) requires public agencies to adopt monitoring and reporting programs or conditions of project approval to mitigate or avoid the identified significant effects (Public Resources Code Section 21081.6(a)(1)). A public agency adopting measures to mitigate or avoid the significant impacts of a proposed project is required to ensure that the measures are fully enforceable, through permit conditions, agreements, or other means (Public Resources Code Section 21081.6(b)). The program must be designed to ensure project compliance with mitigation measures during project implementation.

The Mitigation Monitoring and Reporting Program (MMRP) is organized in a table format (see Table 1: Mitigation Monitoring and Reporting Program for Corral Hollow/Linne Road Intersection Improvement Project), keyed to each significant impact and each mitigation measure. Only mitigation measures adopted to address significant impacts are included in this program. Each mitigation measure is set out in full, followed by a tabular summary of monitoring requirements. The column headings in the tables are defined as follows:

Mitigation Measures: This column presents the mitigation measure identified in the EIR.

Monitoring/Reporting Responsibility: This column contains an assignment of responsibility for the monitoring and reporting tasks.

Timing of Implementation: This column refers to when the measure is required to be implemented.

City Staff/Notes: This column will be used by the lead agency to document the person who verified the implementation of the mitigation measure and the date on which this verification occurred.

1.2 Enforcement

If the project is approved, the MMRP for the development would be incorporated as a condition of such approval. Therefore, all mitigation measures for significant impacts must be carried out to fulfill the requirements of approval. A number of the mitigation measures would be implemented during the course of the development review process. These measures would be checked on plans, in reports, and in the field prior to construction. Most of the remaining mitigation measures would be implemented during the construction, or project implementation phase.

Table 1: Mitigation Monitoring and Reporting Program for the Corral Hollow/Linne Road Intersection Improvement Project

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
Agricultural and Forestry Resources				
AG Threshold (a)	**MM AG-1: Agricultural Mitigation Fee.** Prior to issuance of a grading permit, the City of Tracy shall pay the adopted agricultural mitigation fee for each acre of Prime Farmland converted. The fee shall be collected prior to construction. The acreage of Prime Farmland developed shall be determined once the final improvement plans are submitted to the City, and the acreage shall be noted on the improvement plans.	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	
Biological Resources				
BIO Threshold (a)	**MM BIO-1, San Joaquin County Multi-Species Habitat Conservation and Open Space Plan.** Prior to any ground disturbance, the City shall, participate in the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) and comply with all required Incidental Take Minimization Measures.	City of Tracy Development and Engineering Services Department, SJMSCP, Qualified Biologist	Prior to any ground disturbing activities	
	MM BIO-2: Avoid and Minimize Impacts to San Joaquin Kit Fox. Prior to any ground disturbance, the City shall ensure that: • A qualified biologist will conduct preconstruction surveys no less than 14 days and no more than 30 days before the commencement of activities to identify potential	City of Tracy Development and Engineering Services Department,	Prior to any ground disturbing activities	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
	dens more than 5 inches in diameter within 200 feet of ground disturbing activities. The City will implement USFWS' (2011) Standardized Recommendations for Protection of San Joaquin Kit Fox Prior to or During Ground Disturbance. The City will notify USFWS in writing of the results of the preconstruction survey within 30 days after these activities are completed. • If potential dens are located within the proposed work area and cannot be avoided during construction activities, a USFWS-approved biologist will determine if the dens are occupied. If occupied dens are present within the proposed work, their disturbance will be avoided. Exclusion zones will be implemented following the most current USFWS procedures (currently USFWS 2011). The City will notify USFWS immediately if a natal or pupping den is found in the survey area, and will present the results of pre-activity den searches within 5 days after these activities are completed and before the start of construction activities in the area.	SJMSCP, Qualified Biologist		
	MM BIO-3: Conduct Swainson's Hawk Surveys. If construction occurs between February 1 and August 31, the City or its contractor(s) shall require that a qualified biologist conduct surveys no more than 10 days before the start of construction for Swainson's hawk in accordance with the recommended timing and methodology developed by the Swainson's Hawk Technical Advisory Committee (2000 or most recent). Surveys will cover a minimum ½-mile radius around the construction area. If nesting Swainson's hawk are detected, buffers shall be established around active nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active nests will be ½ mile unless a qualified biologist determines, based on a site-specific evaluation, that a smaller buffer is sufficient to avoid impacts on nesting raptors. Factors to be considered when determining buffer size include the presence of natural buffers provided by vegetation or topography, nest height, locations of foraging territory, and baseline	City of Tracy Development and Engineering Services Department, SJMSCP, Qualified Biologist	Prior to any ground disturbing activities	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
	levels of noise and human activity. Buffers shall be maintained until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival.			
	MM BIO-4: Nesting Bird Avoidance. To the extent feasible, construction activities should be scheduled to avoid the nesting season. If project activities are scheduled to take place outside the nesting season, impacts to nesting birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Joaquin County extends from February 1 through August 31. 31.If it is not possible to schedule project activities outside the nesting season, then the following measures will be implemented: • A qualified biologist will conduct pre-construction surveys for nesting birds. These surveys shall be conducted no more than seven days prior to the initiation of project activities, including tree and vegetation removal. During these surveys, the biologist shall inspect all trees and other potential nesting habitats (e.g., shrubs, ruderal areas, burrows, and structures) in and immediately adjacent to the construction areas for nests. • If an active nest is found sufficiently close to work areas to be disturbed by these activities, a non-disturbance buffer zone will be established around the nest at the biologist's discretion and in accordance with regulatory permits and conditions to ensure that no nests of special-status species or species protected by the MBTA and California Fish and Game Code shall be disturbed during project implementation. Buffers zones will remain until the birds have fledged or the nest is no longer active as determined by a qualified biologist.	City of Tracy Development and Engineering Services Department, SJMSCP, Qualified Biologist	Prior to any ground disturbing activities	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
BIO Threshold (d)	**MM BIO-3**	City of Tracy Development and Engineering Services Department, SJMSCP, Qualified Biologist	Prior to any ground disturbing activities	
BIO Threshold (f)	**MM BIO-1**	City of Tracy Development and Engineering Services Department, SJMSCP, Qualified Biologist	Prior to any ground disturbing activities	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
Cultural Resources				
CR Threshold (a)	**MM CUL-1: Construction Worker Awareness Training** Prior to the start of ground disturbance, all construction personnel involved with earth-moving activities should be informed that artifacts protected by law could be discovered during excavating. The training should include the appearance of common artifacts and proper notification procedures should artifacts be discovered. This worker training should be prepared and presented by a qualified archaeological professional.	City of Tracy Development and Engineering Services Department, Qualified Archaeologist	Prior to ground disturbing activities.	
	MM CUL-2: Subsurface Cultural Resources The Improvement Plans shall include the following statement: Prior to any ground disturbance the contractor shall demonstrate that a qualified archaeological monitor and a Native American monitor have been retained to perform onsite construction monitoring during the initial grading and excavation phase of the project. If any archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone are uncovered during any on-site construction activities, all work shall be stopped immediately within a 50-foot radius of the find and the qualified archaeologist and Native American Monitor shall evaluate the deposit. The archaeologist and Native American monitor shall 1) evaluate the find(s) to determine if they meet the definition of a	City of Tracy Development and Engineering Services Department, Qualified Archaeologist	Prior to the approval of improvement plans and during excavation activities.	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
	historical, archaeological, or cultural resource; and (2) make appropriate recommendations regarding the disposition of such finds prior to issuance of building permits. The qualified archaeologist and Native American monitor shall have authority to halt construction activities temporarily in the immediate vicinity of an unanticipated find. If, for any reasons, the qualified archaeologist or Native American monitor is not present, but construction crews encounter a cultural resource, all work shall stop temporarily within 50 feet of the find until a qualified archaeologist and Native American monitor has been contacted to determine the proper course of action. If the finds do not meet the definition of a historical, archaeological, and cultural resources, no further study or protection is necessary prior to project implementation. If the find(s) does meet the definition of a historical, archaeological, or cultural resource, the find and the area around the find shall be avoided by project activities and a Cultural Resources Treatment Plan as described in MM CUL-3 shall be implemented.			
	MM CUL-3: Subsurface Cultural Resources Treatment Plan. If subsurface testing revealed the presence of cultural resources, the qualified archeologist shall prepare an archaeological resources treatment plan prior to issuance of any grading permits. The treatment plan shall utilize data recovery methods to reduce impacts on subsurface resources. The treatment plan shall contain, at a minimum: • Identification of the scope of work and range of subsurface effects (including location map and development plan), including requirements for preliminary field investigations.	City of Tracy, Development and Engineering Services Department, Lead Archaeologist, Native American Monitor	If cultural resources are discovered during construction.	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
	• Description of the environmental setting (past and present) and the historic/prehistoric background of the parcel (potential range of what might be found). • Development of research questions and goals to be addressed by the investigation (what is significant vs. what is redundant information). • Detailed field strategy, including reasonable and good faith efforts to consult with Native American representatives regarding the most appropriate method to record, recover, or avoid the finds and address research goals. • Analytical methods. • Report structure and outline of document contents. • Disposition of the artifacts. • Appendices: all site records, correspondence, and consultation with Native Americans, etc. The treatment plan shall be prepared and submitted to the Supervising Environmental Planner for review and approval prior to the issuance of any grading permits.			
Geology and Soils				
GEO Threshold (a. iii)	**MM GEO-1: Geotechnical Engineering Investigations** Prior to earthmoving activities, a certified geotechnical engineer, or equivalent shall be retained to perform a final geotechnical evaluation of the soils at a design level. The final geotechnical evaluation shall include design recommendations to ensure that soils conditions do not pose a threat to the health and safety of people or structures. The	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
	grading and improvement plans shall be designed in accordance with the recommendations provided in the final geotechnical evaluation.			
GEO Threshold (c)	**MM GEO-1**	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	
GEO Threshold (c)	**MM GEO-1**	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	
GEO Threshold (d)	**MM GEO-1**	City of Tracy Development and Engineering Services Department, Certified Geotechnical Engineer	Prior to the approval of improvement plans.	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
GEO Threshold (f)	**MM GEO-2: Paleontological Resources** If paleontological resources are discovered during the course of construction, work shall immediately halt within 50 feet of the discovery and the City of Tracy shall be notified. A qualified paleontologist shall be retained to determine the significance of the discovery. If the paleontological resource is considered significant, a recovery and preservation plan shall be developed by the qualified paleontologist and the resource shall be donated to a local agency, State University, or other applicable institution, where the resources can be studies, curated, and displayed for public education purposes if applicable. and implemented.	City of Tracy Development and Engineering Services Department, Qualified Paleontologist	Prior to the approval of improvement plans.	
Hazards and Hazardous Materials				
HAZ Threshold (b)	**MM HAZ-1: Design-Level Environmental Investigations** In the event that hazardous materials are encountered during construction, the area will be evaluated by a qualified professional and a Soils management plan (SMP) shall be submitted and approved by the City/County of San Joaquin County Department of Environmental Health. The SMP shall require identification of the materials and shall establish management practices for the handling and disposal of the materials. Work shall not resume until the materials are removed and work is reauthorized by the City.	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	

Threshold	Mitigation Measure	Monitoring/ Reporting Responsibility	Timing of Implementation	City Staff Notes; Initials/Date when Done
Hydrology and Water Quality				
HYD Threshold (c. iii.)	**MM HYD-1: Drainage Precautions** The proposed project's storm drainage infrastructure plan shall, to the satisfaction of the City engineer demonstrate adequate infrastructure capacity to collect and direct all stormwater generated on the project site to proposed stormwater conveyance system and demonstrate that the project will not result in-on or off-site flooding impacts. If the City engineer determines that the proposed stormwater drainage system would not be adequate, comments would be provided, and amendments to the plans shall be made to the engineer's satisfaction.	City of Tracy Development and Engineering Services Department	Prior to the approval of improvement plans.	
Tribal Cultural Resources				
TCR Threshold (a)	**MM CUL-1, MM CUL-2, and MM CUL-3**	City of Tracy Development and Engineering Services Department, Qualified Archaeologist	Prior to the approval of improvement plans and during excavation activities.

State Clearinghouse Number (if submitted to State Clearinghouse): 2022110250

Project Title: Linne Road/Corral Hollow Road Intersection Improvement Project

Project Applicant: City of Tracy

Project Location (include county): Intersection of Linne Road and Corral Hollow Road in San Joaquin County, CA

Project Description:
The project includes improvements within the intersection of Corral Hollow Road and Linne Road and within portions of adjacent parcels. Corral Hollow Road would be widened to two (2) travel lanes in each direction. Improvements to Linne Road would be made to widen the road to enable paving and striping of a new right turn-only lane. The existing left lane would remain and be used as left only to southbound Corral Hollow Road. New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road as well as streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road.

This is to advise that the City of Tracy City Council (☒ Lead Agency or ☐ Responsible Agency) has approved the above

described project on October 17, 2023 (date) and has made the following determinations regarding the above described project.

1. The project [☐ will ☒ will not] have a significant effect on the environment.
2. ☐ An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
   ☒ A Negative Declaration was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures [☒ were ☐ were not] made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan [☒ was ☐ was not] adopted for this project.
5. A statement of Overriding Considerations [☐ was ☒ was not] adopted for this project.
6. Findings [☒ were ☐ were not] made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:
City of Tracy, Development Services, 333 Civic Center Plaza, Tracy, CA 95376

RESOLUTION 2023-_____

---

1) ADOPTING THE MITIGATED NEGATIVE DECLARATION AND MITIGATION MONITORING AND REPORTING PROGRAM, IN ACCORDANCE WITH THE CALIFORNIA ENVIRONMENTAL QUALITY ACT, FOR THE TRAFFIC SIGNAL INSTALLATION AND ROADWAY WIDENING AT CORRAL HOLLOW ROAD AND LINNE ROAD INTERSECTION PROJECT, CAPITAL IMPROVEMENT PROJECT 72104, AND 2) AUTHORIZING THE CITY MANAGER TO EXECUTE AND FILE THE NOTICE OF DETERMINATION.

WHEREAS, the Traffic Signal Installation and Roadway Widening at Corral Hollow Road and Linne Road Intersection is an approved Capital Improvement Project (CIP) 72104 (Project); and

WHEREAS, the Project scope includes the widening of Corral Hollow Road from just north of the Union Pacific Railroad (UPRR) right-of-way at W. Linne Road to approximately 500 feet south of W. Linne Road per the City approved Interim Geometry Exhibit prepared by Kimley Horn & Associates, Inc., and includes the construction of new travel lanes, a traffic signal at the intersection, a pre-signal for southbound traffic on Corral Hollow Road before the UPRR railroad tracks, improvements to the UPRR gate crossing, installation of streetlights, median, curbs, sidewalks, drainage basin, and coordination/relocation of affected existing franchise utilities; and

WHEREAS, on April 6, 2021, per Resolution No. 2021-040, the City Council approved a Professional Services Agreement for Mark Thomas and Company, Inc., for the project management, preparation of plans, specifications, and estimate (PS&E), environmental document preparation, railroad and utility coordination, preparation of plats and legal description for right of way acquisition and community involvement; and

WHEREAS, this Project is an integral part of Corral Hollow Road Corridor Widening from Parkside Road to I-580; and

WHEREAS, the City is the lead agency under the California Environmental Quality Act (CEQA) for environmental review of the Project, and in November 2022, the environmental sub-consultant for the Project, Kimley-Horn and Associates, Inc., prepared an Initial Study/Mitigated Negative Declaration (IS/MND) for the Project; and

WHEREAS, the City has evaluated potential environmental effects of the Project through the preparation and circulation of a proposed Mitigated Negative Declaration (State Clearinghouse No. 2022110250) and consideration of all comments and responses as attached hereto as Exhibit 1, and incorporated herein by this reference. This process included the following actions:

1. The 30-day review period for the proposed Mitigated Negative Declaration was initiated on November 14, 2022, with the submittal of the proposed Mitigated Negative Declaration to the State Clearinghouse for public review and distribution to responsible, trustee, and public agencies with jurisdiction over the resources affected by the Project. The Notice of Intent (NOI) to adopt the Mitigated Negative Declaration was filed with the San Joaquin County Clerk on or about November 14, 2022. On November 14, 2022, the NOI was published in the Tracy Press newspaper prior to beginning the 30-day review period. Copies of the environmental documents were available for review at the City Tracy Development Services Department, as well as on the City's website: https://www.cityoftracy.org/our-city/departments/engineering/engineering-news.

2. Two comment letters on the proposed Mitigated Negative Declaration were received by the City before the end of the 30-day public review period on December 15, 2022 and no modifications to the MND were deemed necessary; and

WHEREAS, all actions required to be taken by applicable law related to the preparation, circulation, and review of the proposed Mitigated Negative Declaration have been taken; and

WHEREAS, no new significant information, as defined by CEQA Guidelines Section 15073.5, was received by the City after circulation of the draft Mitigated Negative Declaration such that recirculation is required, and the information contained in the final Mitigated Negative Declaration supports the draft Mitigated Negative Declaration's analysis and conclusions; and

WHEREAS, the IS/MND determined that the proposed Project will not have significant impacts on the environment with the inclusion of appropriate avoidance, minimization and mitigation measures included in the draft Mitigation Monitoring and Reporting Program (MMRP); and

WHEREAS, CEQA requires that the lead agency, in this case the City, consider the proposed Mitigated Negative Declaration and MMRP, together with any comments received during the public review process; and

WHEREAS, staff recommends that the City Council adopt the Mitigated Negative Declaration and the MMRP, as the appropriate environmental document; and

WHEREAS, staff further recommends that the City Council authorize the City Manager to file a Notice of Determination with the San Joaquin County Clerk after execution, and together, this will complete the environmental document process for the Project, in compliance with CEQA; and now, therefore be it

RESOLVED: That the City Council of the City of Tracy hereby incorporates, as findings, the recitals set forth above as if restated herein in their entirety; and be it

FURTHER RESOLVED: That the City Council is making its decision to adopt the Mitigated Negative Declaration for this Project in light of the record as a whole as set forth in these findings; and be it

FURTHER RESOLVED: That the City Council, in adopting the Mitigated Negative Declaration and MMRP for this Project, of which the findings set forth in this Resolution are a part, did so through the exercise of their independent judgment and review after finding substantial evidence, in light of the record as a whole, to support the adoption of the Mitigated Negative Declaration MMRP; and be it

FURTHER RESOLVED: That the City Council has made its decision to adopt the Mitigated Negative Declaration and MMRP in the light of all the testimony and evidence presented at or prior to the close of the public hearing, including letters, reports, comments, analyses, etc., which the City Council after review and comment by its staff, critically reviewed, corrected, and augmented where necessary, as set forth in the record and procedural findings on this Project; and be it

FURTHER RESOLVED: That the City Council finds that this Project should not have a potentially significant effect on the environment with mitigation measures incorporated, based upon the criteria of the Guidelines of the State Secretary for Resources, Sections 15064 (Determining Significant Effect), 15065 (Mandatory Findings of Significance), and 15070 (Decision to prepare a Mitigated Negative Declaration), and the reasons as documented in the Mitigated Negative Declaration and MMRP for the Project, attached hereto; and be it

FURTHER RESOLVED: That the City Council finds that the mitigation measures needed for this Project have been incorporated in the Project, as set forth in the Mitigated Negative Declaration and MMRP, and in the independent judgment of the City Council, there is no substantial evidence that the Project, with the mitigation measures incorporated, could have a significant effect on the environment; and be it

FURTHER RESOLVED: That based on the findings set forth in this Resolution, and on the record of the public hearing, the City Council hereby approves the Mitigated Negative Declaration for the Project, as presented to Council and set forth in the staff report and certifies that the Mitigated Negative Declaration is an adequate and complete document prepared in compliance with the California Environmental Quality Act, as amended, and the State and local Guidelines promulgated there under; and be it

FURTHER RESOLVED: That the City Council hereby adopts the Mitigation Motoring and Reporting Program set forth in 9.0 of the Mitigated Negative Declaration and incorporated herein by this reference, as the Mitigation Monitoring and Reporting Program for the Project; and be it

FURTHER RESOLVED: That the City Council finds that the Mitigation Monitoring and Reporting Program has been prepared in accordance with CEQA and the CEQA Guidelines and directs the City Manager to oversee the implementation of the Program; and be it

FURTHER RESOLVED: That the City Council hereby authorizes and directs the City Manager to file a Notice of Determination within five (5) working days after approval of this Resolution.

1.0 INTRODUCTION & PURPOSE

1.1 PURPOSE AND SCOPE OF THE INITIAL STUDY

This IS/MND has been prepared in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code [PRC] Section (§) 21000 et seq.) and its Guidelines (California Code of Regulations [CCR], Title 14, §15000 et seq.), to evaluate the potential environmental effects associated with the construction and operation of the Corral Hollow and Linne Road Improvements Project (proposed project). Pursuant to Section 15367 of the State CEQA Guidelines, the City of Tracy (City) is the lead agency for the proposed project. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

As set forth in the State CEQA Guidelines Section 15070, an IS/MND can be prepared when the Initial Study has identified potentially significant environmental impacts, but revisions have been made to a project, prior to public review of the Initial Study, that would avoid or mitigate the impacts to a level considered less than significant; and there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment.

1.2 SUMMARY OF FINDINGS

Section 3.0 of this document contains the Environmental Checklist that was prepared for the proposed project pursuant to CEQA requirements. The Environmental Checklist indicates whether the proposed project would result in no impact, less than significant impacts, less than significant impacts with the implementation of mitigation measures, or potentially significant impacts. These impacts are identified and discussed within each subsequent resource area throughout this document.

MITIGATION MEASURES

State CEQA Guidelines Section 15041, *Authority to Mitigate,* gives the lead agency for a project the authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements such as the "nexus" and "rough proportionality" standards. CEQA Guidelines Section 15364 defines "feasible" as capable of being accomplished in a successful manner within a reasonable period of time, considering economic, environmental, legal, social, and technological factors. Mitigation measures will be adopted, as needed and feasible, to reduce the environmental impacts to less than significant levels and must be consistent with all applicable constitutional requirements, including the following:

- There must be an essential nexus (i.e., connections) between the mitigation measure and legitimate governmental interest.
- The mitigation measure must be "roughly proportional" to the impacts of the project.

Several forms of mitigation under CEQA Section 15370 are summarized as follow:

- **Avoiding** the impact by not taking a certain action(s);
- **Minimizing** impacts by limiting the degree or magnitude of the action and its implementation;
- **Rectifying** the impact by repairing, rehabilitating, or restoring the impacted environment;

- **Reducing or eliminating** the impact over time by preservation and maintenance operations during the life of the action; and
- **Compensating** for the impact by replacing or providing substitute resources or environment.

Avoiding impacts is the preferred form of mitigation, followed by minimizing or rectifying the impact to less than significant. Compensating for impacts would be pursued if no other form of mitigation is feasible.

ENVIRONMENTAL RESOURCE TOPICS

This IS/MND evaluates the proposed project's impacts on the following resource topic:

- Aesthetics
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazard and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Tribal/Cultural Resources
- Transportation
- Utilities and Service Systems
- Wildfire

1.3 REPORT ORGANIZATION

This document has been organized into the following sections:

Section 1.0 – Introduction. This section provides an introduction and overview describing the conclusions of the Initial Study.

Section 2.0 – Project Description. This section identifies key project characteristics and includes a list of anticipated discretionary actions.

Section 3.0 – Initial Study Checklist. The Environmental Checklist Form provides an overview of the potential impacts that may or may not result from project implementation.

Section 4.0 – Environmental Evaluation. This section contains an analysis of environmental impacts identified in the environmental checklist.

Section 5.0 – References. The section identifies resources used to prepare the Initial Study.

2.0 DESCRIPTION OF PROPOSED PROJECT

2.1 PROJECT LOCATION

The proposed project is located within in the City of Tracy in San Joaquin County, California. The project site is located at the intersection of Corral Hollow Road and Linne Road. The project site is located approximately 1.5 miles north of the Interstate 5/Corral Hollow Road freeway interchange and approximately 0.75-mile north of the Tracy Municipal Airport. The project also would result in acquisitions of portions of seven existing parcels, and would be adjacent to one parcel, and make a minor upgrade to immediately adjacent area. Please see **Figure 2-1: Regional Map** and **Figure 2-2: USGS Topographic Map**, that show the project location. The APN's and addresses that would be affected, the acreage of those parcels, right-of-way acquired, existing land uses, and description of the acquired property are shown in *Table 2-1: Project Parcels and Acquisition Areas*.

Table 2-1: Project Parcels and Acquisition Areas

APN and Address	Acres	ROW Acquired	Existing Land Uses	Description of Acquired Property
025-311-029 11888 W. Linne Road	22.99	0.0 acres	Heavy Industrial	None. Adjacent to the southerly boundary of the parcel.
025-311-020 28720 South Corral Hollow Road	1.9	0.53 acres	Rural Residential – 2 or more residential	Disturbed/mowed undeveloped land, billboard, fencing, gravel/dirt driveway and parking lot
024-401-008 None	1.31	0.24 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder
024-401-007 None	1.31	0.04 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder/Easement for railroad line
024-014-033 28499 South Corral Hollow Road	14.49	0.12 acres	Road and Rail shoulder	Disturbed roadway and railroad shoulder/Easement for railroad line
025-302-012 28677 South Corral Hollow Road	119.55	01.60 acres	Irrigated Orchard	Interior dirt road in orchard adjacent to Corral Hollow Road. Approximately 24-26 orchard trees.
024-014-021 24855 South Corral Hollow Road	1.95	0.1 acres	Small industrial utility building with gated dirt driveway	No Acquisition – Make improvement to existing driveway.
025-311-002 28818 South Corral Hollow Road	1.49	0.1 acres	Heavy Industrial	No Acquisition – Make improvement to existing driveway.

2.2 ENVIRONMENTAL SETTING

REGIONAL SETTING

Regionally, the City of Tracy in central California and approximately 53 miles directly east of San Francisco and 19 miles southwest of Stockton. The City of Tracy is in an area of California called the Central Valley. The Central Valley is an elongated valley occupying the central region of California and is on average 50 miles wide and approximately 400 miles in length from the City of Redding on the north to approximately 30 miles south of the City of Bakersfield on the south (USGS, 2021). As one of the most notable structural depressions in the world, the Central Valley is known for its prolific agricultural production. Hydrologically, the project site is within the San Joaquin Basin, which is characterized by the San Joaquin River which flows northwesterly from the Sierra Mountains to the southeast and through the basin with outlets to the San Francisco Bay and ultimately the Pacific Ocean. The City of Tracy is located approximately four miles west of the nearest reaches of the river and approximately 10 miles from the western boundary of the basin at Coast Range approximately 10 miles to the west.

LOCAL SETTING

The land uses within the project area are consists of a mix of agriculture, industrial, residential, and infrastructure (canals and airport). Residential uses are dominant to the north as new development is expanding southerly from the main City center. Residential development is located to the northwest of the project site and additional homes are under construction. Further to the northwest the primary land uses are agricultural production. To the southeast, south, and southwest, the project is surrounded by a mix of land uses. This includes industrial uses for concrete production, the Tracy Municipal Airport, American Legion Park, the Tracy Water Treatment Plan, the northerly reach of the Delta Mendota Canal, and agricultural land.

Adjacent land uses to the north of Linne Road include highly disturbed roadway shoulder and the Union Pacific Railroad (UPRR). This area is nearly devoid of vegetation and does not contain any structures. To the south of Linne Road is an industrial site with numerous buildings used for sand and gravel operations and manufacturing concrete products. To the southeast of the corner of Linne Road and Corral Hollow Road is a lot that is partially developed with three small single-story structures. The westerly side of this lot is adjacent to the eastern alignment of Corral Hollow Road. The northerly portion of the lot contains a undeveloped but disturbed area with an existing billboard. The southerly half of this parcel contains three structures. To the west of Corral Hollow Road is agricultural land that is cultivated with an orchard. There are above ground power lines strung on wooden power poles along both the southerly sides of Linne Road and the easterly side of Corral Hollow Road.

Figure 2-3: Aerial Map, shows the project intersection and roadways on an aerial, and **Figure 2-4: Project Acquisition Areas**, show project site and portions of adjacent parcels that would be acquired, or have improvements made, as well as areas needed for temporary construction easements. The City of Tracy General Plan and zoning designations for the project parcels are shown in *Table 2-2: Project Parcels General Plan and Zoning*. Adjacent to the north and northwest of the Corral Hollow Road intersection land use designation is for Commercial (C), to the southwest is Urban Reserve, and to the southeast Industrial.

Table 2-2: Project Parcels General Plan and Zoning

APN and Address	General Plan	County Zoning
025-311-029 **11888 W. Linne Road**	Heavy Industrial	I/L
025-311-020 **28720 South Corral Hollow Road**	Heavy Industrial	I/L
024-401-008 **None**	Existing Linne Road alignment and ROW	Rail Road/UPRR ROW
024-401-007 **None**	Existing Linne Road alignment and ROW	Rail Road/UPRR ROW
024-014-033 **28499 South Corral Hollow Road**	None	AU-20
025-302-012 **28677 South Corral Hollow Road**	Urban Reserve	AU-20
024-014-021 **24855 South Corral Hollow Road**	Commercial	AU-20
025-311-002 **28818 South Corral Hollow Road**	Heavy Industrial	I/L AU-20 Rail Road/UPRR ROW

PROJECT APPROVALS

The proposed project would require the following approvals:

- Improvement Plans

2.3 PROPOSED PROJECT

The proposed project would make transportation improvements within Corral Hollow Road, Linne Road, within the intersection of the two roadways and within portions of adjacent parcels as shown in *Table 1*, above. Improvements would include widening Corral Hollow Road, Linne Road, and the addition of signals within the intersection. The intersection of Corral Hollow Road currently operates at a deficient LOS. The improvements, widening, addition of dedicated turn land and addition of signalization and improvements would improve the LOS. Intersection improvements would improve mobility, alleviate traffic congestion, and improve traffic efficiency along Corral Hollow Road.

Corral Hollow Road would be widened to two (2) travel lanes in each direction. These project improvements would start immediately north of the Union Pacific Railroad (UPRR) right of way ROW and extend southerly to approximately 500 feet south of the intersection with W. Linne Road. Other improvements proposed along Corral Hollow Road would include the construction of a center median, curbs, and sidewalks. New sidewalk and curb and gutter would be installed on the westerly side of the

roadway and at the two corners of the intersections. Standard sidewalks and curb ramps would be Americans with Disabilities (ADA) compliant. In addition, the driveways to the adjacent properties would be improved with new concrete driveways (a total of four new driveways would be installed. One each at APNs (024-014-041), (25-311—020), and two for APN (025-311-002).

A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Other standard improvements would include the installation of new signage, roadway striping, and crosswalks. All roadway improvements would conform to Caltrans and City standards as applicable.

Minor improvements to Linne Road would be made, primarily in the westbound lanes. The road would be widened to enable paving and striping of a new right turn only lane. The existing left lane would remain and be used as a left only to southbound Corral Hollow Road. New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road as well as streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road by the proposed project. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal, the pre-signal, and raising and lowering of guard arms, would be created in coordination with UPRR. All work within the UPRR right of way will be constructed by UPRR labor forces.

As discussed above, some right of way (ROW) acquisitions would be required. In addition to the listed 40 orchard trees above, approximately 151 other trees would be removed, for new right-of-way and a temporary construction easement. In addition, the project would require removals of some existing hardscape, existing fencing, and grinding and matching with existing pavement grades, and utility relocation.

It should be noted that Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). **Figure 2-5: Project Improvement Plans**, provides a graphic representation and location of the proposed improvements.

Stormwater

The proposed project would include new stormwater facilities and would utilize an approximate 0.35-acre retention basin to contain stormwater flows, promote water infiltration, and reduce potential for increased downstream stormwater flows.

Utilities

The proposed project, as needed, would tie into existing utilities for electrification of the new signals, streetlights, and other roadway and railroad crossings. The project does not propose any tie in to existing water, sewer, or gas facilities because the project does not include new land uses. The proposed project would realign the above ground utility lines and poles adjacent to the new roadways.

Construction

Some demolition, excavation, and grading would be required for this project. Equipment that may be used to accomplish project work is listed below. Some excavation to a maximum depth of 14 feet for the installation of traffic signal poles, six feet for the drainage feature, and four feet for road widening would be required only where these project elements are proposed.

Bobcat/skid steer loader	Gradall (multi-purpose excavator
Compactor (Ground)	Jackhammer
Concrete Mixer Truck	Pavement Scarifier/Roller
Concrete Saw	Pneumatic Tools
Crane or bucket truck	Truck (Dump/Flat Bed
Dozer/Grader/Excavator/Scraper

3.0 INITIAL STUDY CHECKLIST

NOTE: The following is a sample form that may be tailored to satisfy individual agencies' needs and project circumstances. It may be used to meet the requirements for an initial study when the criteria set forth in CEQA Guidelines have been met. Substantial evidence of potential impacts that are not listed on this form must also be considered. The sample questions in this form are intended to encourage thoughtful assessment of impacts, and do not necessarily represent thresholds of significance.

1. **Project title:**

   The Corral Hollow and Linne Road Improvements Project

2. **Lead agency name and address:**

   City of Tracy
   333 Civic Center Plaza
   Tracy, CA 95376

3. **Contact person and phone number:**

   Anju Pillai, PE., MS Engr.
   Senior Civil Engineer
   (209) 831 6455

4. **Project location:**

   11888 W. Linne Road, 28720 South Corral Hollow Road, APN 024-401-008 and 024-401-007 (no address), 28499 South Corral Hollow Road, 28677 South Corral Hollow Road, 24855 South Corral Hollow Road.

5. **Project sponsor's name and address:**

   City of Tracy
   333 Civic Center Plaza
   Tracy, CA 95376

6. **General plan designation:**

   Commercial (C), Industrial (I), and Urban Reserve 10[1]. The project area has been planned for in the City General Plan and includes these designations.

7. **Zoning:**

   Limited Industrial (I/L); (Industrial) Agriculture-Urban Reserve (AU-20); Railroad/UPRR ROW. The proposed project is within unincorporated San Joaquin County and includes these zones.

[1] Urban Reserve 10 – is a 120-acre parcel and is a portion of the previously approved South Schulte Specific Plan area. The vision for the area is for industrial development to capitalize on the area's proximity to I-580 and the Union Pacific Railroad line. See page 110/402 of General Plan.

8. Description of project: (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary.)

The proposed project would widen Corral Hollow Road to two (2) travel lanes in each direction starting immediately north of the Union Pacific Railroad (UPRR) right of way (ROW) at W. Linne Road to approximately 500 feet south of the intersection with W. Linne Road. Improvements proposed by the project along Corral Hollow Road in addition to the widening would include the construction of a median, curbs, and sidewalks, the construction of a drainage feature on the west side of the project site, and the installation of new signage and striping. Some ROW acquisition, temporary construction easements, and utility relocation would be required for project implementation. Linne Road would be widened to enable restriping for a single right-turn lane only and left turn only lane for westbound traffic.

New traffic signals would also be installed at the intersection of Corral Hollow Road and W. Linne Road, streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal and the pre-signal would be created in coordination with UPRR.

9. Surrounding land uses and setting: Briefly describe the project's surroundings:

The area surrounding the project is designated for commercial, industrial, and urban reserve. Existing surrounding uses include industrial (sand and gravel, concrete operations), agricultural (orchard), residential uses (low density residential (LDR) further to the northwest and northeast and UPRR railroad adjacent to Linne Road and that crosses Corral Hollow Road. The project is located near the westerly City limits and would primarily occur within existing roadways (Corral Hollow Road and Linne Road).

10. Public agencies whose approval is required (e.g., permits, financing approval, or participation agreement.)

City of Tracy

- Adoption of the Mitigated Negative Declaration (MND);
- Adoption of the Mitigation Monitoring and Reporting Plan (MMRP), and
- City review and approval of Grading and Improvement Plans.

Other Agencies which may be required to issue a permit or approval.

- Department of Water Resources (DWR);
- Regional Water Quality Control Board - National Pollution Discharge Elimination System (NPDES), and Stormwater Pollution Prevention Plan (SWPPP);
- San Joaquin Valley Air Pollution Control District;
- San Joaquin Council of Governments (SJCOG);
- California Department Fish and Wildlife (CDFW); and
- California Department of Toxic Substances Control (DTSC);

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

On August 1, 2022 the City of Rio Tracy, acting as the CEQA Lead Agency informed eight tribes including the (Ione Band of Miwok Indians, The Confederated Villages of Lisjan, Muwekma Ohlone Indian Tribe of the SF Bay Area, North Valley Yokuts Tribe, Tule River Indian Tribe, Buena Vista Rancheria of Me-Wuk Indians, Wilton Rancheria, and Wuksache Indian Tribe/Eshom Valley Band of the proposed project and invited to consult. No requests for consultation were received.

NOTE: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

3.1 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Unless Mitigation Incorporated" as indicated by the checklist on the following pages. No environmental factors were identified as "Potentially Significant Impact."

- ☐ Aesthetics
- ☒ Agricultural and Forestry Resources
- ☐ Air Quality
- ☒ Biological Resources
- ☒ Cultural Resources
- ☐ Energy
- ☒ Geology/Soils
- ☐ Greenhouse Gas Emissions
- ☒ Hazards & Hazardous Materials
- ☒ Hydrology/Water Quality
- ☐ Land Use/Planning
- ☐ Mineral Resources
- ☐ Noise
- ☐ Population/Housing
- ☐ Public Services
- ☐ Recreation
- ☐ Transportation
- ☒ Tribal Cultural Resources
- ☐ Utilities/Service Systems
- ☐ Wildfire
- ☐ Mandatory Findings of Significance

DETERMINATION:

On the basis of this initial evaluation (check one):

☐ The proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ Although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ The proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ The proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ Although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

4.0 ENVIRONMENTAL ANALYSIS

AESTHETICS

ENVIRONMENTAL IMPACTS Issues		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
1.	**AESTHETICS. Except as provided in Public Resources Code Section 21099, would the project:**				
a)	Have a substantial adverse effect on a scenic vista?			**X**	
b)	Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?			**X**	
c)	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?			**X**	
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?			**X**	

a) Have a substantial adverse effect on a scenic vista?, and c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The City of Tracy General plan does not specifically designate any scenic viewsheds within the City. The existing Tracy General Plan Draft EIR does, however, note Tracy's scenic environmental resources include the views to the surrounding natural hillsides in the western portion of the City, as well as views of agricultural land from highways and other roadways (City of Tracy, 2005).

Under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the public. A vista is a view from a particular location or combination of locations; a scenic vista combines an aesthetically pleasing aspect, often natural, to the vista. Examples of scenic vistas can include mountain ranges, valleys, ridgelines, water bodies, or visually important trees, rock outcroppings, or historic buildings. While a scenic vista may be formally designated, they can be informal public views. Changes in the viewshed are

typically discussed in terms of foreground, middleground, and background views. An adverse effect to a scenic vista may result from a degradation of an existing vista or the loss of access to an existing viewpoint.

Impacts to scenic resources occur when changes to a site have an effect on these resources directly or impact the availability of views to such resources. The proposed project is located within Corral Hollow and Linne Road at a stop-controlled intersection in an area characterized by industrial, agricultural, residential, railroad, and utilities (e.g., overhead powerlines). Proposed improvements would widen the roadways, signalize the intersection, install streetlights, make pedestrian improvements, and tie into existing portions of Corral Hollow Road to the north and south that have already been widened.

The project would introduce new visual elements to the project site but the changes to the visual environment would not be considered a substantial alternation. The proposed project would not significantly impact any scenic vista. The new signal poles, mast arms, and street lighting would be above ground level and extend upward from ground level and be visible in the skyline from closer viewing angles. These elements, however, would not be dissimilar to the existing power poles, power lines, streetlights, and billboard, and railroad crossing arms. The proposed project would relocate the powerlines on adjacent to the existing Corral Hollow Land alignment and would remove the billboard which would decrease the visual obstructions in the skyline.

The proposed project does not include any other elements that would be elevated and have the potential to affect any distant views or a the local viewshed. The proposed project would be consistent with the existing visual environment and is an extension of existing uses. Thus, the proposed project would not result in a substantial alteration to the existing visual character of the site or its surroundings. The proposed project would not substantially alter the existing character of the area. Impacts would be less than significant, and no mitigation is required.

b) Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?

Less than Significant Impact. The project site is not located within view of a scenic highway. There are two officially designated scenic highway segments in the City including portions of Interstate 580 (I-580) between I-205 and I-5, and I-5 between I-205 and the Stanislaus County border. The proposed project may be intermittently viewed between highway berm from I-580, which is approximately 1.5 miles to the south and west. interment views, however, would be available at highway travel speeds and would largely be obscured by intervening development, manufactured slopes along the freeway, and intervening vegetation. The project site is not visible from the segment of I-5 between I-205 and the Stanislaus County border.

Thus, **a**lthough the project site may be intermittently visible from I-580 for short periods of time, there are no trees, rock outcroppings, or historical buildings on the project site that would alter the viewshed from the perspective of viewers from the freeway. Therefore, the proposed project would not substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway. Implementation of the proposed project would have a less than significant impact in this regard and mitigation is not required.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. See Impact discussion under a), above.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. There is a potential for the implementation of the proposed project to introduce new sources of light and glare into the project area during construction and operation. Contributions to light and glare impacts would include temporary during construction, short-term and only occurring this period of time. The project does include new streetlights and signals that would introduce a new light source in the area for the life of the project. The proposed project would conform to City of Tracy standards for street lighting that establish requirements for light illumination, the use of LED lighting, the use of light shields, and lighting that is directed downward to minimize the effects of spill light, the halo effect, and potential for glare. Thus, the proposed project would have a less than significant impact in this regard and mitigation is not required.

Cumulative Impacts

The potential aesthetic impacts related to views, aesthetics, and light and glare are generally site-specific. As discussed above, project-related changes would be minimal and impacts to scenic vistas would be less than significant. The proposed project would not substantially change the on-site visual character because the new visual elements would not be dissimilar from the existing visual environment. The project also would not alter the balance of the surrounding areas and they would retain their exiting character. New sources of lighting from the signalization and streetlights would be consistent with the other recent improvements along Corral Hollow Road and would not make a substantial contribution to new light sources in the area. Similar to the proposed project, other projects would be required to use lights that are shielded and directed. Therefore, while the proposed would make minor change the appearance of the site, this project in conjunction with other past, present, and reasonably foreseeable projects in the vicinity would follow applicable local planning and design guidelines regarding roadway design including materials, coloration, and landscaping. This would serve to minimize the effects to aesthetic resources and cumulative impacts would be less than significant.

AGRICULTURE AND FORESTRY RESOURCES

ENVIRONMENTAL IMPACTS Issues		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.	**AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:**				
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?		**X**		
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?			**X**	
c)	Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?			**X**	
d)	Result in the loss of forest land or conversion of forest land to non-forest use?			**X**	
e)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?			**X**	

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Potentially Significant Unless Mitigation Incorporated. Based on the California Department of Conservation Important Farmland Monitoring and Mapping Program (FMMP), the project site is located on Urban and Build and Prime Farmland. Urban and Built-up Land is defined as land that is occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airport, golf courses, sanitary landfills, sewage treatment, and water control structures.

Prime Farmland is irrigated land with the best combination of physical and chemical features able to sustain long term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for production of irrigated crops at some time during the four years prior to the mapping date. The FMMP shows that approximately,1.60 acres of APN 025-302-012 is within a 146.9-acre area that is designated as Prime Farmland and would be converted to a nonagricultural use. The majority of the area, however, would not be modified and the area used for the retention basin and most of the surrounding area would not be paved. Thus, while the area would be changed from its exiting use as an orchard the soils that are valuable for agricultural would not be permanently lost.

In addition, the potential environmental impacts from development of the roadway and project area for urban uses and the associated removal of Prime Farmland for agricultural use were considered and addressed in the City of Tracy General Plan and Final EIR. The EIR disclosed that buildout of the General Plan would result in the conversion of farmland and it result in a significant and unavoidable impact. While mitigation measures, were adopted to minimize the loss, on February 1, 2011, the Tracy City Council adopted a Statement of Overriding Considerations (Resolution 2011-028) for conversion of agricultural land within the City. Mitigation measures include the implementation of a “Right to Farm” ordinance by the City (Or. 10.24 et seq.) that is intended to preserve and protect existing agricultural operations within the incorporated City, and participation in the City’s agricultural mitigation fee program (Tracy Municipal Code, Chapter 13.26).

Although, the 1.6 acres is identified as Prime Farmland, this area is identified in the General Plan for use as urban reserve. The balance of the project areas is identified for use as industrial and commercial, and the remainder is already used as roadway and unproductive roadway right-of-way. Thus, development of the project area for future urban land uses was planning in the Tracy General Plan and implementation of the proposed project would not create new impacts over and above those identified in the General Plan Final EIR and would not significantly change previously identified impacts.

As part of the development process for individual site-specific projects, the agricultural mitigation fee adopted by the City shall be paid for each acre of Prime Farmland to be converted. The fee is outlined in Chapter 13.28, Agricultural Mitigation Fee, of the Tracy Municipal Code. The fees shall be collected by the City at the time building permits are issues for such site-specific projects, or as

otherwise required by the City of Tracy. The proposed project would be subject to the agricultural mitigation fee, as required by Mitigation Measure **MM AG-1**. With implementation of this mitigation measure, the proposed project would have a less than significant impact relative to this issue.

MM AG-1: Prior to issuance of a grading permit, the City of Tracy shall pay the adopted agricultural mitigation fee for each acre of Prime Farmland converted. The fee shall be collected prior to construction. The acreage of Prime Farmland developed shall be determined once the final improvement plans are submitted to the City, and the acreage shall be noted on the improvement plans.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Less Than Significant Impact. Refer to a), above. The 2015 San Joaquin County Williamson Act Parcel map viewer from August, shows the portion of the site within APN 025-302-012 is under a Williamson Act contract. The area, however, is not shown under the more recent San Joaquin County Agricultural Preserve Zone. The portion of the proposed project in this area is designated in the General Plan as Urban Reserve and does not have existing zoning for agricultural use. This renders the project consistent with the buildout development scenario contemplated in the General Plan and preciously analyzed in the General Plan EIR.

In addition, and as discussed above, the majority of the 1.6-acre area would remain undeveloped, would not contain hardscape, and would be used for roadway shoulder and retention basin. As such, while the area would be taken out of agricultural production and approximate 151 orchard trees would be removed, the existing soils which are a large part of the property's value for agricultural production would remain. In addition, the proposed project would not result in any greater impacts associated with conversion of Williamson Act lands than identified in the General Plan EIR, impacts would not be greater than previously analyzed. Thus, impacts for the purpose of this project, would be less than significant, and additional mitigation is not required.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Less Than Significant Impact. The project is not zoned as forest land, timberland, or timberland production and no land in the project vicinity is. Therefore, the proposed project would not conflict or cause rezoning of any forest land (as defined in Public Resource Code section 12220(g)) timberland (as defined by Public Resources Code section 4526), or zoned Timberland Production (as defined by Government Code section 51104(g)). Therefore, impacts related to the loss of this agricultural resource are less than significant.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to c), above.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to a) and c)

Cumulative Impacts

The proposed project includes transportation improvements and roadway widening needed to accommodate future development envisioned by the General Plan. The proposed project would occur within areas that are identified for development and are designated as industrial, commercial, urban reserve. Implementation of the proposed project would not induce any additional or new population growth not already identified in the General Plan or studied in the General Plan EIR. As discussed above, with implementation of Mitigation Measure AG-1, the proposed project would pay appropriate development fees as would other past, present, and reasonably foreseeable projects that fall within qualified areas designated as farmland. Thus, the proposed project would not result in new impacts related to agricultural resources, nor would the proposed project result in an increase in the severity of an impact related to agricultural resources previously disclosed in the General Plan EIR. Therefore, the proposed project would not cause either a new cumulative impact to occur, nor a substantial increase in the severity of a cumulative impact previously disclosed.

AIR QUALITY

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
3. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?			**X**	
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?			**X**	
c) Expose sensitive receptors to substantial pollutant concentrations?			**X**	
d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?			**X**	

REGULATORY SETTING

Federal

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the U.S. Environmental Protection Agency (EPA) developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter 10 microns in diameter or less (PM_{10}), particulate matter 2.5 microns in diameter or less ($PM_{2.5}$), and lead. Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "nonattainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires that each state prepare a State Implementation Plan (SIP) to demonstrate how it will attain the NAAQS within the federally imposed deadlines.

The EPA has designated enforcement of air pollution control regulations to the individual states. Applicable federal standards are summarized in *Table 4-1: State and Federal Ambient Air Quality Standards.*

California Air Resources Board

The California Air Resources Board (CARB) administers California's air quality policy. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. These standards, included with the NAAQS in *Table 4-1*, are generally more restrictive than federal standards for each of the criteria pollutants except for lead and the 8-hour average for CO.

Table 4-1: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	Federal Primary Standards	California Standard
Ozone	1-Hour	---	0.09 ppm
	8-Hour	0.070 ppm	0.070 ppm
Carbon Monoxide	8-Hour	9.0 ppm	9.0 ppm
	1-Hour	35.0 ppm	20.0 ppm
Nitrogen Dioxide	Annual	0.053 ppm	0.030 ppm
	1-Hour	0.100 ppm	0.18 ppm
Sulfur Dioxide	Annual	---	---
	24-Hour	---	0.04 ppm
	1-Hour	0.075 ppm	0.25 ppm
PM_{10}	Annual	---	20 $\mu g/m^3$
	24-Hour	150 $\mu g/m^3$	50 $\mu g/m^3$
$PM_{2.5}$	Annual	12 $\mu g/m^3$	12 $\mu g/m^3$
	24-Hour	35 $\mu g/m^3$	---
Lead	30-Day Average	---	1.5 $\mu g/m^3$
	Rolling 3-Month Average	0.15 $\mu g/m^3$	---

Source: California Air Resources Board, 2016
ppm = parts per million;
µg/m3 = micrograms per cubic meter

Regional

San Joaquin Valley Air Pollution Control District (SJVAPCD)

The project site lies within the northern portion of the San Joaquin Valley Air Basin (SJVAB). The San Joaquin Valley Air Pollution Control District (SJVAPCD) has jurisdiction over most air quality matters in the SJVAB and is tasked with implementing programs and regulations required by the FCAA and CCAA. If a project is found to interfere with the region's ability to comply with NAAQS and CAAQS, local governments then need to consider project modifications or provide mitigation measures to eliminate the inconsistency of the project plans. In order for a project to be considered "consistent" with the latest Air Quality Plan (AQP), the project must be consistent with the goals, objectives, and assumptions in the respective plan to achieve Federal and State air quality standards. Additionally, both construction-related and long-term emissions are required to be quantified and compared to the SJVAPCD significance thresholds.

Local air districts and CARB monitor ambient air quality to ensure that air quality standards are met, and if they are not met, to also develop strategies to meet the standards. Air quality monitoring stations

measure pollutant ground-level concentrations (typically, 10 feet above ground level). Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "non-attainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. *Table 4-2: Attainment Status of the San Joaquin Valley Air Basin* summarizes the State and federal attainment status for criteria pollutants in the SJVAB.

Table 4-2: Attainment Status of the San Joaquin Valley Air Basin

Pollutant	State Standard	Federal Standard
Ozone (O_3) – 1-Hr Standard	**Severe Non-attainment**	No Federal Standard
Ozone (O_3) – 8-Hr Standard	**Non-attainment**	**Extreme Non-attainment**
Inhalable Particulates (PM_{10})	**Non-attainment**	Attainment-Maintenance
Fine Particulates ($PM_{2.5}$)	**Non-attainment**	**Non-attainment**
Carbon Monoxide (CO)	Attainment	Attainment-Maintenance
Nitrogen Dioxide (NO_X)	Attainment	Attainment
Sulfur Dioxide (SO_X)	Attainment	Attainment
Lead (Pb)	Attainment	No Federal Standard

Notes:
1. The Valley is designated nonattainment for the 1997 federal $PM_{2.5}$ standard. U.S. EPA released final designations for the 2006 $PM_{2.5}$ standards (effective in 2009), designated the Valley as nonattainment.
2. On May 5, 2010 the Valley was reclassified to extreme attainment in the Federal Register (effective June 4, 2010).
3. Effective June 15, 2005, the U.S. Environmental Protection Agency (U.S. EPA) revoked the federal 1-hour ozone standard, including associated designations and classifications. EPA had previously classified the SJVAB as extreme nonattainment for this standard. EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan on March 8, 2010 (effective April 7, 2010). Many applicable requirements for extreme 1-hour ozone nonattainment areas continue to apply to the SJVAB. In 2011, U.S. EPA indicated it plans to designate the entire State as attainment/unclassified for the 2010 NO2 standard. Final designations have yet to be made by U.S. EPA.

Non-attainment pollutants are highlighted in **Bold**.

As shown in *Table 4-2*, although the SJVAB is in attainment as to all NAAQSs, it is designated as non-attainment with respect to the more stringent State PM_{10} standard and the State's 8-hour ozone standard.

Clean Air Plan

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans. The FCAA and CCAA require plans to be developed for areas designated as nonattainment (with the exception of areas designated as nonattainment for the state PM_{10} standard). The SJVAPCD is responsible for developing a Clean Air Plan, which guides the region's air quality planning efforts to attain the CAAQS. The SJVAPCD adopted the 2022 Ozone Plan and 2018 $PM_{2.5}$ Plan.

SJVAPCD periodically develops air quality plans that outline the regional strategy to improve air quality and protect the climate. The most recent plan, 2018 Plan for the 1997, 2006, and 2012 $PM_{2.5}$ Standards, includes a wide range of control measures designed to reduce emissions of air pollutants and GHGs.

Local

City of Tracy General Plan

The City of Tracy General Plan Air Quality Element includes the objectives and policies intended to control or reduce air pollution impacts. Relevant policies are listed below:

Objective AQ-1.1: Improve air quality and reduce greenhouse gas emissions through land use planning decisions.

Objective AQ-1.2: Promote development that minimizes air pollutant and greenhouse gas emissions and their impact on sensitive receptors as a result of indirect and stationary sources.

P1. The City shall assess air quality impacts using the latest version of the CEQA Guidelines and guidelines prepared by the San Joaquin Valley Air Pollution Control District.

P2. The City shall assess through the CEQA process any air quality impacts of development projects that may be insignificant by themselves, but cumulatively significant.

P3. Developers shall implement best management practices to reduce air pollutant emissions associated with the construction and operation of development projects.

P13. Dust control measures consistent with San Joaquin Valley Air Pollution Control District rules shall be required as a condition of approval for subdivision maps, site plans, and all grading permits.

P14. Developments that significantly impact air quality shall only be approved if all feasible mitigation measures to avoid, minimize or offset the impact are implemented.

Objective AQ-1.3: Provide a diverse and efficient transportation system that minimizes air pollutant and greenhouse gas emissions.

P1. The City shall continue to work with the San Joaquin Council of Governments on regional transportation solutions.

THRESHOLDS

The City of Tracy, including the project site, is located within the northern portion of the San Joaquin Valley Air Basin (SJVAB) and is within the jurisdictional boundaries of the SJVAPCD. The SJVAB area is currently designated as a non-attainment area for the State and federal O_3, State and federal $PM_{2.5}$, and State PM_{10} standards. The SJVAB is designated attainment or unclassified for all other NAAQS and CAAQS. It should be noted that although the EPA revoked their 1-hour ozone standard in 2005, in May of 2016, the EPA proposed findings that the SJVAB was in attainment of the 1-hour ozone standard.

In compliance with regulations, due to the non-attainment designations of the area, the SJVAPCD periodically prepares and updates air quality plans that provide emission reduction strategies to achieve attainment of the NAAQS and CAAQS, including control strategies to reduce air pollutant emissions through regulations, incentive programs, public education, and partnerships with other agencies. The most recent ozone plan is the 2016 Ozone Plan for the 2008 8-Hour Ozone Standard, which was adopted by the SJVAPCD on June 16, 2016. CARB subsequently conducted a public meeting to consider approval of the 2016 Ozone Plan for the 2008 8-Hour Ozone Standard, and approved the plan on July 21, 2016. Additionally, the most recent federal attainment plan for PM is the 2016 Plan for the 1997 $PM_{2.5}$ Standard, which was approved by the District Governing Board on April 16, 2015.

The aforementioned air quality plans contain mobile source controls, stationary source controls, and transportation control measures (TCMs) to be implemented in the region to attain the NAAQS and CAAQS within the SJVAB. Adopted SJVAPCD rules and regulations, as well as the thresholds of significance, have been developed with the intent to ensure continued attainment of NAAQS and CAAQS, or to work towards attainment for which the area is currently designated non-attainment, consistent with applicable air quality plans. The SJVAPCD has established broad significance thresholds associated with the construction and operation emissions for various criteria pollutants including ozone precursors such as reactive organic gases (ROG) and oxides of nitrogen (NO_X), as well as for PM_{10}, $PM_{2.5}$, SO_X, and CO expressed in tons per year. Thus, by exceeding the SJVAPCD's mass emission thresholds for operational emissions of ROG, NO_X, PM_{10}, $PM_{2.5}$, SO_X, or CO a project would be considered to conflict with or obstruct implementation of the SJVAPCD's air quality planning efforts. The SJVAPCD's adopted thresholds of significance for criteria pollutant emissions are presented in *Table 4-3: SJVAPCD Criteria Pollutant Thresholds of Significance*. If the proposed project's emissions exceed the applicable thresholds of significance presented in the table, the project could violate an air quality standard, contribute to an existing or projected air quality violation or conflict with or obstruct implementation of the applicable air quality plans.

Table 4-3: SJVAPCD Criteria Pollutant Thresholds of Significance

Criteria Air Pollutants and Precursors (Regional)	Construction-Related	Operational-Related
	Average Annual Emissions (tons/year)	Annual Average Emission (tons/year)
Reactive Organic Gases (ROG)	10	10
Nitrogen Oxides (NO_X)	10	10
Carbon Monoxide (CO)	100	100
Sulfur Oxides (SO_X)	27	27
Coarse Particulates (PM_{10})	15	15
Fine Particulates ($PM_{2.5}$)	15	15
Source: SJVAPCD, March 19, 2015.		

ENVIRONMENTAL IMPACTS

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. The SJVAPCD is tasked with implementing programs and regulations required by the FCAA and the CCAA. In that capacity, the SJVAPCD has prepared plans to attain Federal and State ambient air quality standards. To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions in their SJVAPCD Guidance for Assessing and Mitigating Air Quality Impacts (2015). Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan". As discussed in Threshold AQ-2 below, the project would not exceed the any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant threshold.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less Than Significant Impact.

Construction Emissions

Project construction activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the project area include ozone-precursor pollutants (i.e., ROG and NO_x) and PM_{10} and $PM_{2.5}$. Construction-generated emissions are short term and temporary, lasting only while construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SJVAPCD's thresholds of significance.

Construction results in the temporary generation of emissions during land clearing, grading, drainage/utilities installation, paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance, as well as weather conditions and the appropriate application of water.

The duration of construction activities associated with the project are estimated to last approximately three months, beginning in June 2024 and concluding at the end of August 2024. The project's construction-related emissions were calculated using the Sacramento Metropolitan Air Quality Management District's Road Construction Emissions Model (RCEM) (Version 9.0.0), which is designed to model emissions for roadway projects, based on typical construction requirements. The project would export a total of approximately 8,985 cubic yards (cy) and import a total of 217 cy of soil during grading. See Appendix A: Air Quality Modeling Data for additional information regarding the construction assumptions used in this analysis. The project's predicted maximum daily construction-related emissions are summarized in *Table 4-4: Construction-Related Emissions*.

Table 4-4: Construction-Related Emissions

Construction Phase	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_x)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
Project Emissions						
Grubbing/ Land Clearing	0.01	0.05	0.06	<1	0.06	0.01
Grading/ Excavation	0.03	0.3	0.25	<1	0.07	0.02
Drainage/ Utilities/ Sub-Grade	0.02	0.19	0.22	<1	0.08	0.02
Paving	0.01	0.13	0.21	<1	0.01	0.01
Maximum	**0.03**	**0.30**	**0.25**	**<1**	**0.08**	**0.02**
SJVAPCD Significance Threshold [2]	*10*	*10*	*100*	*27*	*15*	*15*
Exceed BAAQMD Threshold?	No	No	No	No	No	No

1. Emissions based on the Sacramento Metropolitan Air Quality Management District Road Construction Emissions Model (Version 9.0.0).
2. SJVAPCD, August 2015.

Source: Refer to the modeling outputs provided in Appendix A.

Fugitive Dust Emissions. Fugitive dust emissions are associated with land clearing, ground excavation, cut-and-fill operations, and truck travel on unpaved roadways. Dust emissions also vary substantially from day to day, depending on the level of activity, the specific operations, and weather conditions. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the project vicinity. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. Pursuant to Regulation VIII, the project would be required to control fugitive dust. The RCEM model assumes a 50 percent control of fugitive dust from water and associated control measures.

Construction Equipment and Worker Vehicle Exhaust. Exhaust emission factors for typical diesel-powered heavy equipment are based on the RCEM defaults. Variables factored into estimating the total construction emissions include the following: level of activity, length of construction period, number of pieces/types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported onsite or offsite. Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies to and from the project site, emissions produced on site as the equipment is used, and emissions from trucks transporting materials and workers to and from the site. Emitted pollutants would include ROG, NO_X, PM_{10}, and $PM_{2.5}$.

ROG Emissions. In addition to gaseous and particulate emissions, the application of asphalt and surface coatings creates ROG emissions, which are O_3 precursors. In accordance with the methodology prescribed by the SJVAPCD, the ROG emissions associated with paving have been quantified. Paints would be required to comply with SJVAPCD's Rule 4601 (Architectural Coatings) and limit the amount of ROG emissions from cutback asphalt in compliance with the requirements of SJVAPCD's Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

Summary. As shown in *Table 4-4*, all criteria pollutant emissions would remain below their respective thresholds. As such, the proposed project's construction would not worsen ambient air quality, create additional violations of federal and state standards, or delay the SJVAB's goal for meeting attainment standards. Impacts would be less than significant.

Operational Emissions

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated.

Cumulative Short-Term Emissions

The SJVAB is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for the CAAQS and nonattainment for O_3 and $PM_{2.5}$ for the NAAQS. discussed above, the project's construction-related emissions would not have the potential to exceed the SJVAPCD significance thresholds for criteria pollutants.

Since these thresholds indicate whether an individual project's emissions have the potential to affect cumulative regional air quality, it can be expected that the project-related construction emissions would not be cumulatively considerable. The SJVAPCD recommends consistency Regulation VIII for all projects whether or not construction-related emissions exceed the thresholds of significance. Compliance with SJVAPCD construction-related mitigation requirements are considered to reduce cumulative impacts at a SJVAB-wide level. As a result, construction emissions associated with the project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

Cumulative Long-Term Impacts

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated. Cumulative impacts would not occur.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact. Sensitive land uses are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. The nearest sensitive receptors to the project site include multi-family residences approximately 300 feet to the southeast along Corral Hollow Road.

Construction Toxic Air Contaminants

Construction equipment and associated heavy-duty truck traffic generates diesel exhaust which is a known Toxic Air Contaminants (TAC). Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. However, the use of diesel-powered construction equipment would be episodic and would occur in various phases throughout the linear project site.

Additionally, construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, Sections 2485 and 2449), which reduce diesel PM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. These regulations would further reduce nearby sensitive receptors' exposure to temporary and variable diesel PM emissions. Given the temporary and intermittent nature of construction activities likely to occur within specific locations in the project site (i.e., construction is not likely to occur in any one location for an extended time), the dose of diesel PM of any one receptor is exposed to would be limited. A less than significant impact would occur in this regard.

Operational Toxic Air Contaminants

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated and no impact with regard to toxic air contaminants would occur.

Carbon Monoxide Hotspots

The primary mobile-source criteria pollutant of local concern is carbon monoxide. Concentrations of CO are a direct function of the number of vehicles, length of delay, and traffic flow conditions. Transport of this criteria pollutant is extremely limited; CO disperses rapidly with distance from the source under normal meteorological conditions. Under certain meteorological conditions, however, CO concentrations close to congested intersections that experience high levels of traffic and elevated background concentrations may reach unhealthy levels, affecting nearby sensitive receptors. Areas of high CO concentrations, or "hot spots," are typically associated with intersections that are projected to operate at unacceptable levels of service during the peak commute hours. CO concentration modeling is therefore typically conducted for intersections that are projected to operate at unacceptable levels of service during peak commute hours.

Although the SJVAPCD has not established a specific numerical screening threshold for CO impacts, the Bay Area Air Quality Management District (BAAQMD) has established that CO impacts may be determined to be less than significant if a project would not increase traffic volumes at local intersections to more than 44,000 vehicles per hour, or 24,000 vehicles per hour for locations in heavily urban areas, where "urban canyons" formed by buildings tend to reduce air circulation. Traffic would increase along surrounding roadways during long-term operational activities.

As discussed above, the project would not result in an increase in trips or vehicle miles traveled. Therefore, the project would not have the potential to create a CO hotspot and impacts would be less than significant.

d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?

Less Than Significant Impact.

Construction

Construction activities associated with the project may generate detectable odors from heavy duty equipment (i.e., diesel exhaust), as well as from architectural coatings and asphalt off-gassing. Odors generated from the referenced sources are common in the man-made environment and are not known to be substantially offensive to adjacent receptors. Any construction-related odors would be short-term in nature and cease upon project completion. As a result, impacts to existing adjacent land uses from construction-related odors would be short-term in duration and therefore would be less than significant.

Operational

According to the SJVAPCD, land uses associated with odor complaints typically include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants. The project does not include any uses identified by the SJVAPCD as being associated with odors. Nonetheless, the project would be subject to the SJVAPCD's Rule 4102, which allows members of the public to submit complaints regarding odor. Impacts would be less than significant.

Cumulative Impacts

The SJVAPCD does not include separate significance thresholds for cumulative operational emissions. As discussed in Threshold b) above, the project would not exceed the any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant threshold. The SJVACPD notes that the nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size by itself to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. Consistency with the SJVAPCD control measures would ensure that the project would not cumulatively contribute to air quality impacts in the SJVAB. Therefore, the project's cumulative contribution of air quality

emissions would be less than significant, and the project's cumulative air quality impacts would also be less than cumulatively considerable.

BIOLOGICAL RESOURCES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
4. BIOLOGICAL RESOURCES. Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		**X**		
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?			**X**	
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological			**X**	
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		**X**		
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			**X**	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?		**X**		

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Potentially Significant Unless Mitigation Incorporated. Special-status species includes plant and/or wildlife species that are legally protected under the federal Endangered Species Act, the California Endangered Species Act, or other regulations, or are considered rare enough by the scientific community and trustee agencies to warrant special consideration.

The project site is located within the existing road grades at the intersection of Corral Hollow Road and Linne Road. Both roads will be widened at the intersection to provide both through lanes and right-turn lane pockets, which will require the acquisition of new right of way (ROW), as well as utility relocation. Agriculture uses are present on the west side on the project site and commercial uses on the east. Additionally, the project site is primarily in the ROW and previously disturbed with no native vegetation.

Many special-status plant species were identified by the CNDDB, CNPS, and USFWS databases as having potential to occur in the region (see Appendix B). However, no special-status plant species are expected to occur in the BSA due to the lack of suitable habitat. No special-status plant species were observed during the biological reconnaissance-level survey, or in previous surveys conducted within the BSA. Since special-status plant species are not expected to occur within the BSA, the project would not impact any special-status plants.

Three surveys were conducted in 2018 for the Corral Hollow Road Widening Phase 2 Linne Road to I-580 Project. This road widening project overlaps the proposed project along Corral Hollow Road, and within the orchard. These surveys were conducted by Steve McMurtry of De Novo Planning Group to evaluate biological conditions within the project area (Horizon Water and Environment, 2022). Horizon Water and Environment conducted a reconnaissance survey of the BSA on May 2, 2022, see Appendix B. The survey was conducted on-foot in all accessible areas within BSA. Natural and anthropogenic features, land cover types, and the presence of common and special-status species were visually surveyed. Visual aids, such as binoculars, were used to better assess survey areas and wildlife species when appropriate. As described in the *Biological Technical Memorandum* (Appendix B) San Joaquin kit fox (Vulpes macrotis mutica) are known to occur in the vicinity of the BSA (Appendix B). Burrowing owl (Athene cunicularia) and Swainson's hawk (Buteo swainsoni) are known to occur at several locations within 5 miles of the proposed project. A Swainson's hawk was also observed perching on a power pole in the BSA during the May reconnaissance survey. Several species of special-status bats may forage over the BSA, including pallid bat (Antrozous pallidus), Townsend's big-eared bat (Corynorhinus townsendii), and western mastiff bat (Eumops perotis californicus). The special-status species with potential to occur include San Joaquin kit fox, Swainson's hawk, burrowing owl, pallid bat, Townsend's big-eared bat, and western mastiff bat.

The SJMSCP provides coverage for impacts to biological resources pursuant to the California Environmental Quality Act (CEQA), the California Endangered Species Act (CESA) and Federal Endangered Species Act (FESA) and is approved and authorized by the California Department of

Fish and Game and the United States Fish and Wildlife Service. Pursuant to these authorizations, applications must be prepared by the lead agency and submitted to the San Joaquin County Council of Governments, Inc. (SJCOG) for accounting and reporting purposes and to guide those participating in the Plan to comply with the provisions of the SJMSCP. Alternatively, the City of Tracy may "opt out" for this project if the City mitigates for identified biological impacts on its own. If the City decides to opt-out of the SJMSCP, the city would be required to conduct pre-construction surveys and ensure that mitigation is appropriately completed without SJCOG support. The specifies identified below would be protected as required by CDFW and USFWS regulations. The below listed mitigation would provide protection of the species through pre-construction surveys and protective measures during construction and would have the option to opt-out of the SJMSCP. Overall, with the implementation of Mitigation Measures **MM BIO-1** through **MM BIO-4**, impacts would be less than significant.

San Joaquin Kit Fox

The BSA is mainly comprised of roadways and orchard. These areas may be utilized by San Joaquin kit fox for dispersal and occasional foraging but are generally not suitable for extended periods of occupation (USFWS 2010). No dens were observed during reconnaissance surveys. Due to the very limited extent of suitable habitat, this species is considered unlikely to occur in the BSA. Although it is unlikely that San Joaquin kit fox would occur within the BSA, construction activities could create temporary barriers to movement and dispersal of this species. Potential impacts to San Joaquin kit fox would be reduced to a less than significant level by implementing Mitigation Measure **MM BIO-2**, which requires pre-construction surveys for San Joaquin kit fox dens and additional avoidance or minimization measures.

Swainson's Hawk

A Swainson's hawk was observed perching on a power pole in the BSA during the May reconnaissance survey. No suitable nesting habitat for this species is present within the BSA. Marginally suitable nesting habitat is present in the tree located to the northeast of the intersection of Corral Hollow Road and the Delta Mendota Canal, to the southeast of the BSA. Trees that provide marginally suitable nesting habitat area also present in the residential development to the north of W. Linne Road. This species may also forage within or adjacent to the BSA. Although no nesting habitat is present within the BSA, this species could nest in the marginally suitable habitat that is present within ½ mile of the BSA. Construction could disturb nesting Swainson's hawk through generation of noise or visual distraction. No suitable nesting habitat would be removed by the project. The project would not remove foraging habitat for Swainson's hawk but would result in temporary noise and visual disturbance during construction that could cause these species to avoid foraging within or adjacent to the BSA. Due to the large amount of foraging habitat available in the region, this would not be a significant impact. Implementation of **MM BIO-3** would reduce impacts to Swainson's hawk to a less than significant level.

Burrowing Owl

No burrows potentially suitable for burrowing owl were observed during reconnaissance surveys, and no burrowing owls, whitewash, or other evidence of occupation by burrowing owls was

observed. Burrowing owl could forage within the vicinity of the BSA. However, this species may disperse and colonize suitable habitat within the BSA. If present in the vicinity of the BSA, construction could disturb burrowing owls through noise, visual distraction, or direct impacts to occupied habitat. Implementation of **MM BIO-4** would reduce potential impacts on burrowing owls to a less than significant level.

Special-Status Bats

Several species of special-status bats may forage over the BSA, including pallid bat, Townsend's big-eared bat, and western mastiff bat. Suitable roosting habitat for these species is not present within the BSA. Construction of the project is anticipated to have minimal impacts on bat foraging, and no impacts on bat roosting. Therefore, impacts would not be significant, and no mitigation would be required.

Nesting Birds

Two inactive nest structures were observed in a shrub within the BSA during the May 2022 survey. Trees and shrubs within and adjacent to the BSA provide suitable nesting substrate for bird species protected by Migratory Bird Treaty Act (MBTA). Impacts to active nests belonging to MBTA- and California Fish and Game Code (CFGC)-protected bird species could occur throughout the BSA and immediately surrounding nesting substrate from construction activities. Indirect effects including project-related noise and vibration generated from nearby construction activities may disrupt nesting activity or nest fitness that could result in nest abandonment, potentially to the point of nestling mortality. Suitable nesting substrate occurs in shrubs and trees in and surrounding the BSA, and MBTA-protected bird species could nest within and adjacent to the BSA. Therefore, active nests of MBTA-protected species could be impacted by the project. Active bird nests protected by CFGC sections 3503 and 3503.5, as well as the MBTA will be avoided through the implementation of **MM BIO-4.** Impacts would therefore be reduced to a less than significant level.

MM BIO-1: **BIO-1, San Joaquin County Multi-Species Habitat Conservation and Open Space Plan.** Prior to any ground disturbance, the City shall,) participate in the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) and comply with all required Incidental Take Minimization Measures.

MM BIO-2: **Avoid and Minimize Impacts to San Joaquin kit fox.** Prior to any ground disturbance, the City shall ensure that:

- A qualified biologist will conduct preconstruction surveys no less than 14 days and no more than 30 days before the commencement of activities to identify potential dens more than 5 inches in diameter within 200 feet of ground disturbing activities. The City will implement USFWS' (2011) Standardized Recommendations for Protection of San Joaquin Kit Fox Prior to or During Ground Disturbance. The City will notify USFWS in writing of the results of the preconstruction survey within 30 days after these activities are completed.
- If potential dens are located within the proposed work area and cannot be avoided during construction activities, a USFWS-approved biologist will

determine if the dens are occupied. If occupied dens are present within the proposed work, their disturbance will be avoided. Exclusion zones will be implemented following the most current USFWS procedures (currently USFWS 2011). The City will notify USFWS immediately if a natal or pupping den is found in the survey area, and will present the results of pre-activity den searches within 5 days after these activities are completed and before the start of construction activities in the area.

MM BIO-3: **Conduct Swainson's Hawk Surveys.** If construction occurs between February 1 and August 31, the City or its contractor(s) shall require that a qualified biologist conduct surveys no more than 10 days before the start of construction for Swainson's hawk in accordance with the recommended timing and methodology developed by the Swainson's Hawk Technical Advisory Committee (2000 or most recent). Surveys will cover a minimum ½-mile radius around the construction area. If nesting Swainson's hawk are detected, buffers shall be established around active nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active nests will be ½ mile unless a qualified biologist determines, based on a site-specific evaluation, that a smaller buffer is sufficient to avoid impacts on nesting raptors. Factors to be considered when determining buffer size include the presence of natural buffers provided by vegetation or topography, nest height, locations of foraging territory, and baseline levels of noise and human activity. Buffers shall be maintained until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival.

MM BIO-4: **Nesting Bird Avoidance.** To the extent feasible, construction activities should be scheduled to avoid the nesting season. If project activities are scheduled to take place outside the nesting season, impacts to nesting birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Joaquin County extends from February 1 through August 31. 31.If it is not possible to schedule project activities outside the nesting season, then the following measures will be implemented:

- A qualified biologist will conduct pre-construction surveys for nesting birds. These surveys shall be conducted no more than seven days prior to the initiation of project activities, including tree and vegetation removal. During these surveys, the biologist shall inspect all trees and other potential nesting habitats (e.g., shrubs, ruderal areas, burrows, and structures) in and immediately adjacent to the construction areas for nests.

- If an active nest is found sufficiently close to work areas to be disturbed by these activities, a non-disturbance buffer zone will be established around the nest at the biologist's discretion and in accordance with regulatory permits and conditions to ensure that no nests of special-status species or species protected by the MBTA and California Fish and Game Code shall be disturbed

during project implementation. Buffers zones will remain until the birds have fledged or the nest is no longer active as determined by a qualified biologist.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Less than Significant Impact. As there are no streams on or near the project site, there is no riparian habitat. Additionally, the US Fish and Wildlife Service did not identify any other sensitive natural communities on the National Wetlands Mapper Inventory. No natural communities of special concern, wetlands, or waters of the United States were identified within the BSA. The project would have a less than significant impact on these habitats.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological?

Less Than Significant Impact. As identified from the US Fish and Wildlife National Wetlands Mapper, there are no identified state or federally protected wetlands mapped within the project site (USFWS, 2022). Therefore, there is a less than significant impact.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Potentially Significant Unless Mitigation Incorporated. As noted, there are no streams on or near the project site. The project site is not a known wildlife migration corridor and is unlikely to be one, given its location amid urban development. However, the project site contains trees around the perimeter of the site and within the new right of way and temporary construction easement. The trees could be used by raptors and other migratory birds during their nesting seasons. If these trees are removed during nesting seasons for these birds, this could have a direct, adverse impact. However, with the implementation of **MM BIO-3**, impacts would be reduced to a level that would be less than significant.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant Impact. The City has a tree ordinance (Tracy Municipal Code [TMC] (Chapter 7.08) that protects “street trees” planted within rights-of-way or planting easements. A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Additionally, approximately 151 other trees would be removed, for new right-of-way and a temporary construction easement. Street tree removal, alteration, and maintenance associated with the project would be in compliance with the City’s Municipal Code, Chapter 7.08.020. Therefore, the project would have a less than significant impact on local biological requirements.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Potentially Significant Unless Mitigation Incorporated. As stated above, project site is located within the jurisdiction of the SJMSCP, the City of Tracy shall consult with SJCOG and investigate coverage of the project pursuant to the SJMSCP. The proposed project site primarily contains land areas that are classified land category/pay zone: Category A – Exempt No Pay Zone and Category C Ag Habitat Open Space, Pay Zone B (Agricultural) under the SJMSCP. The proposed project is consistent with the SJMSCP and coverage under the plan can be done. Alternatively, the City of Tracy may "opt out" for this project if the City mitigates for identified biological impacts on its own. If the City decides to opt-out of the SJMSCP, the city would be required to conduct pre-construction surveys and ensure that mitigation is appropriately completed without SJCOG support. As discussed above under impact a) **MM BIO-1** which would require consultation with SJOG would reduce impacts to a less than significant level.

Cumulative Impacts

Overall, the project is a previously disturbed with existing development located next to an urban environment. Therefore, the development of project site would not be cumulatively considerable. In addition, the site in not located within a known habitat corridor and does not contain any riparian habitat, federally protected wetlands, or other sensitive natural communities. Though the project is located within the SJMSCP, it would comply with all policies, fees, and mitigation measures associated. Therefore, with the above-mentioned mitigation measures the project would have a less than significant impact on biological resources.

CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Impact		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
5.	**CULTURAL RESOURCES. Would the project:**				
a)	Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?			**X**	
b)	Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?		**X**		
c)	Disturb any human remains, including those interred outside of dedicated cemeteries?			**X**	

a) Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?

Less Than Significant Impact. A *Historical Resources Evaluation Report* (HRER) was prepared for the project in 2022 and is attached as Appendix C. The HRER evaluates potential historical resources for inclusion in the California Register of Historical Resources (CRHR) in accordance with Section 15064.5(a) of the California Environmental Quality Act (CEQA) Guidelines. A records search (IC File Number. 19-2028) was conducted by the Central California Information Center (CCIC) on May 3, 2022, and a supplemental request (under the same IC File Number) on May 5, 2022. The CCIC, an affiliate of the California Office of Historic Preservation (OHP), is the official State repository of cultural resource reports for San Joaquin County. The records search included the APE and an additional 0.25-mile radius around the project area. The results of the records search indicate two historic properties or previously recorded historical resources within the APE or the 0.25-mile radius around the APE:

- 39-000089 Delta Mendota Canal (multiple addresses)
- 39-000098 Western Pacific Railroad (WPRR) (multiple addresses)

Field investigations were undertaken by a qualified architectural historian, Kara Brunzell, on May 13, 2022. Each parcel was observed from the public right of way and all visible facades were photographed. Ms. Brunzell inspected all photographs collected in order to make recommendations regarding potential architectural significance and historic integrity.

Two properties were recorded within the APE, including one rural-residential complex (MR2) and one residential property (MR1). DPR 523 series forms, which thoroughly describe each resource, are included in Appendix C. The properties are recommended not eligible for listing on the NRHP or CRHR.

One previously identified historic property, the Delta-Mendota Canal, has been determined eligible for the NRHP but is located outside the APE. Therefore, the APE contains one previously known historic property, the Western Pacific Railroad. The WPRR (MR3), which was completed in 1908, has been recorded many times over the years beginning in 1994, and several studies have included evaluations and integrity assessments of specific stretches of the railroad alignment. The railroad alignment could not be reevaluated for this study because only a short segment, roughly 20 foot by 80 foot stretch that crosses Corral Hollow Road just north of Linne Road, of the linear resource (which is over 700 miles long) is within the APE for this project. The WPRR is therefore being assumed eligible for listing on the NRHP for the purposes of the project pursuant to Stipulation VIII.C.4 of Caltrans' Section 106 PA. Though the WPRR is within the APE, the proposed project would not result in any alteration to the existing structure. Therefore, the project would have a less than significant impact and not cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Potentially Significant Unless Mitigation Incorporated. As indicated above An Ar*chaeological Survey Report* (July, 2022) was prepared for the project and is attached as Appendix D. The *Archaeological Survey Report* identified that, through a records search, eight project studies had previously been conducted within the projects area of potential effects (APE). As stated above, the record search determined that one cultural resource, the WPRR (P-39-000098), has previously been recorded in the APE. The records search found no other cultural resources. Additionally, an examination of USGS maps, dating back to 1916, indicated that there was no development in the project APE, other than the presence of the UPRR and Linne Road, until at least 1954. These early maps also indicate that there are no water sources, ephemeral or permanent, in the project vicinity. The closest natural surface water is Corral Hollow Creek located 1.5 miles to the southeast. The entire APE is underlain by Zacharias clay loam. These are deep deposits derived from alluvium on fans extending out from the base of the coastal range to the west. A gravel lens occurs at a depth of approximately 53 inches beneath the ground surface and there is no restrictive layer (hardpan) up to 80 inches in depth (Natural Resources Conservation Service [NRCS] 2022). Zacharias clay loams are Early to Middle Holocene in age (7,000 – 4,000 BP) and, thus, have a high potential to contain buried cultural deposits. However, this potential is influenced by other factors, such as distance to water, ecotone, and slope. As noted above, early maps of the region do not identify a nearby source of viable water. As a result, the potential for buried cultural remains at the project location is severely diminished (Peak 2020:19-20). Further, the following historical organizations were contacted via email on June 24, 2022, to obtain information regarding potential historic resources in the vicinity of the APE: San Joaquin County Historical Society and the Tracy Historical Museum (see Appendix D). The San Joaquin County Historical Society responded in an email on June 27, 2022. They had no information on historical resources in the project area but noted that significant Native American sites are known to exist in Corral Hollow, several miles south of the proposed project. There has been no response from the Tracy Historical Museum, to date.

An archaeological survey of the APE was conducted on May 12, 2022, by Janis Offermann, M.A., RPA, an archaeologist who meets the U.S. Secretary of the Interior's Professional Standards for

Archaeology. Single transects were walked along the current and proposed right of way on the shoulders of Corral Hollow and Linne roads, where ground surface visibility was very good. Areas of expanded right of way that included the orchard at the southwest corner of the Corral Hollow/Linne Road intersection were also examined in approximate 10-meter transects. A small area of proposed new right of way at the southeast corner of the intersection was not surveyed, as the area was fenced and not accessible (see Appendix D). As previously noted, all of the APE had previously been subject to past archaeological survey. No archaeological resources were identified and recorded during the pedestrian survey. Though overall impacts are anticipated to be minor there is the potential of subsurface resources. Though the circumstances would present a low possibility, the following mitigation measures (MM) would reduce impacts in the unanticipated discovery of archaeological resources during construction. With the implementation of **MM CUL-1, MM CUL-2,** and **MM CUL-3** impacts would be less than significant.

MM CUL-1: **Construction Worker Awareness Training:** Prior to the start of ground disturbance, all construction personnel involved with earth-moving activities should be informed that artifacts protected by law could be discovered during excavating. The training should include the appearance of common artifacts and proper notification procedures should artifacts be discovered. This worker training should be prepared and presented by a qualified archaeological professional.

MM CUL-2: **Subsurface Cultural Resources:** The Improvement Plans shall include the following statement: Prior to any ground disturbance the contractor shall demonstrate that a qualified archaeological monitor and a Native American monitor have been retained to perform onsite construction monitoring during the initial grading and excavation phase of the project. If any archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone are uncovered during any on-site construction activities, all work shall be stopped immediately within a 50-foot radius of the find and the qualified archaeologist and Native American Monitor shall evaluate the deposit. The archaeologist and Native American monitor shall 1) evaluate the find(s) to determine if they meet the definition of a historical, archaeological, or cultural resource; and (2) make appropriate recommendations regarding the disposition of such finds prior to issuance of building permits. The qualified archaeologist and Native American monitor shall have authority to halt construction activities temporarily in the immediate vicinity of an unanticipated find. If, for any reasons, the qualified archaeologist or Native American monitor is not present, but construction crews encounter a cultural resource, all work shall stop temporarily within 50 feet of the find until a qualified archaeologist and Native American monitor has been contacted to determine the proper course of action. If the finds do not meet the definition of a historical, archaeological, and cultural resources, no further study or protection is necessary prior to project implementation. If the find(s) does meet the definition of a historical, archaeological, or cultural resource, the find and the area around the find shall be avoided by project activities and a Cultural Resources Treatment Plan as described in MM CUL-3 shall be implemented.

MM CUL-3: **Subsurface Cultural Resources Treatment Plan:** If subsurface testing revealed the presence of cultural resources, the qualified archeologist shall prepare an archaeological resources treatment plan prior to issuance of any grading permits. The treatment plan shall utilize data recovery methods to reduce impacts on subsurface resources. The treatment plan shall contain, at a minimum:

- Identification of the scope of work and range of subsurface effects (including location map and development plan), including requirements for preliminary field investigations.
- Description of the environmental setting (past and present) and the historic/prehistoric background of the parcel (potential range of what might be found).
- Development of research questions and goals to be addressed by the investigation (what is significant vs. what is redundant information).
- Detailed field strategy, including reasonable and good faith efforts to consult with Native American representatives regarding the most appropriate method to record, recover, or avoid the finds and address research goals.
- Analytical methods.
- Report structure and outline of document contents.
- Disposition of the artifacts.
- Appendices: all site records, correspondence, and consultation with Native Americans, etc.

The treatment plan shall be prepared and submitted to the Supervising Environmental Planner for review and approval prior to the issuance of any grading permits.

c) Disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. No human remains are known to be present within the project site. If human remains are found, those remains would require proper treatment in accordance with applicable laws, including Health and Safety Code (HSC) §§ 7050.5-7055 and PRC § 5097.98 and § 5097.99. HSC §§ 7050.5-7055 describe the general provisions for treatment of human remains. Specifically, HSC § 7050.5 prescribes the requirements for the treatment of any human remains that are accidentally discovered during excavation of a site. HSC § 7050.5 also requires that all activities cease immediately, and a qualified archaeologist and Native American monitor be contacted immediately. As required by state law, the procedures set forth in PRC § 5097.98 would be implemented, including evaluation by the County Coroner and notification of the NAHC. The NAHC would then designate the "Most Likely Descendent" of the unearthed human remains. If human remains are found during excavation, excavation would be halted in the vicinity of the discovery and any area that is reasonably suspected to overlay adjacent remains shall remain undisturbed until the County Coroner has investigated, and appropriate recommendations have been made for the treatment and disposition of the remains. Compliance with the established regulatory framework (i.e., HSC § 7050.5-7055 and PRC §§ 5097.98 and 5097.99) would ensure potential project impacts concerning human remains are reduced to less than significant

Cumulative Impacts

Overall, the project would not cause a considerable impact to historical cultural resources, archaeological cultural resources, or human remains. Due to the project location and previously disturbed project site ground, and the addition of the above listed mitigation measures the proposed project would not cause a cumulatively considerable impact to occur.

ENERGY

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
6. ENERGY. Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?			**X**	
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?			**X**	

BACKGROUND

Appendix F of the State CEQA Guidelines requires consideration of the potentially significant energy implications of a project. CEQA requires mitigation measures to reduce "wasteful, inefficient and unnecessary" energy usage (Public Resources Code Section 21100, subdivision [b][3]). According to Appendix F of the CEQA Guidelines, the means to achieve the goal of conserving energy include decreasing overall energy consumption, decreasing reliance on natural gas and oil, and increasing reliance on renewable energy sources. Depending on the nature of a given project, a project may be considered "wasteful, inefficient, and unnecessary" if were to violate state and federal energy standards and/or result in significant adverse impacts related to project energy requirements, energy inefficiencies, energy intensiveness of materials, cause significant impacts on local and regional energy supplies or generate requirements for additional capacity, fail to comply with existing energy standards, otherwise result in significant adverse impacts on energy resources, or conflict or create an inconsistency with applicable plan, policy, or regulation. Projects such as residential, commercial, or industrial, that have daily on-going demands for energy for uses such as heating, cooling, lightings, and that would generate a vehicle trips and vehicle uses that would use fossil fuels, will require sometimes substantial continued energy use through the life of a project. This is different than projects including transportation projects, such as the proposed project where the vast majority of energy is used during construction and relatively minimal amount of energy is needed for long-term lighting (e.g., traffic signals, streetlights, and routine maintenance).

ENVIRONMENTAL IMPACTS

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact. The proposed project consists of roadway widening, lane adjustments and restriping, median installation, curb and gutter, a retention basin, new signals and

streetlights. Energy consumption associated with construction of the proposed project would primarily include the use of diesel fuel from on-road hauling trips, off-road construction diesel equipment (e.g scrapers, blades, dozers, and back-hoe's), and gasoline consumption from on-road worker commute and vendor trips. Temporary electric power during construction for as-necessary lighting and electric equipment (such as computers inside temporary construction trailers, and heating, ventilation, and air conditioning), if needed, would be powered by a generator(s). The amount of electricity used during construction is anticipated to be minimal and additional demand would stem from the use of electrically powered hand tools and equipment. As discussed above, the majority of the energy used during construction would be from fuels, diesel and gasoline, derived from petroleum.

Operational energy would be negligible as the proposed project does not include any new structures or buildings such as commercial, industrial, or residential that would require sustained long-term use of energy or increase trip generation or VMT. Thus, because the project does not include any structures, the amount of electricity required for operation of the project would be extremely low. The only electricity required for the project operation would be for the proposed traffic signals and streetlights.

Estimates of vehicle fuel consumed were derived based on the assumed construction schedule, vehicle miles travelled for haulers and workers provided in the SMAQMD Roadway Construction Emissions Model, and Year 2020 gasoline MPG factors provided by EMFAC2021. Gasoline would be the primary fuel used for worker trips and the proposed project is anticipated to require approximately 2,500 gallons based on the anticipated vehicle miles travelled by the workers, Diesel fuel would be the primary fuel consumed during construction, by construction equipment and based on the phasing of construction would be approximately 14,069 Gallons. Other energy use would be from continued operations and maintenance. Proposed project landscape maintenance activities would generally require a minimal use of fossil fuels to power maintenance equipment such as vehicles and lawn mowers. The energy used to power landscape maintenance equipment would not differ substantially from the energy required for landscape maintenance for similar project. These energy uses are necessary to enable construction of routine maintenance of the proposed project and are not considered wasteful. In addition, because work efforts would use modern equipment designed to reduce fuel consumption, it would not be considered inefficient.

Conclusion

The proposed project would use energy resources for the on-road vehicle trips (e.g., gasoline and diesel fuel) generated by the proposed project, from off-road construction activities associated with the proposed project (e.g., diesel fuel), and from landscape maintenance activities (e.g., gasoline and diesel fuel). Each of these activities would require the use of energy resources.

The proposed project would comply with all applicable Federal, State, and local regulations regulating energy usage. Energy provided to the project site would be from Pacific Gas and Electric (PG&E). PG&E provides electricity and natural gas to the project area and is anticipated to continue to do so for electrifying the signals and lights. PG&E is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the Statewide Renewable Portfolio Standard (RPS) to increase the proportion of renewable energy (e.g., solar

and wind) within its energy portfolio and PG&E is expected to achieve a 50 percent mix of renewable energy resources by 2030. Other Statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies for all City vehicles and those used to intermittently maintain and service the improvements and thereby conserve gasoline and diesel fuel.

As a result, the proposed project would not result in any significant adverse impacts related to project energy requirements, energy use inefficiencies, and/or the energy intensiveness of materials by amount and fuel type for each stage of the project including construction, operations, maintenance, and/or removal, PG&E, the electricity and natural gas provider to the proposed streetlights, maintains sufficient capacity to serve the proposed project. The proposed project would comply with all existing energy standards, including those established by the City of Tracy, and would not result in significant adverse impacts on energy resources. For these reasons, the proposed project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the threshold as described by Appendix F of the CEQA Guidelines. This is a less than significant impact

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. The proposed project would be required to comply with existing regulations, including applicable measures and regulations that would directly reduce energy use. This would include conformance with statewide regulations related to the use of low carbon fuel standards and increasingly stringent Renewable Portfolio Standards. As such, the project would not conflict with any other state-level regulations pertaining to energy. Thus, the proposed project would comply with existing State energy standards and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Impacts in this regard would be less than significant and mitigation is not required.

Cumulative Impacts

As discussed above, the use of fuel consumption during construction of the proposed project would not be inefficient, wasteful, or unnecessary. The proposed project would use an incrementally small volume of fuels and would not substantially affect existing energy or fuel supplies, or resources and new capacity would not be required. Therefore, the project's cumulative contribution of energy use would be less than significant, and the project's cumulative energy impacts would also be less than cumulatively considerable.

GEOLOGY AND SOILS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
7. GEOLOGY AND SOILS. Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			**X**	
ii) Strong seismic ground shaking?			**X**	
iii) Seismic-related ground failure, including liquefaction?		**X**		
iv) Landslides?			**X**	
b) Result in substantial soil erosion or the loss of topsoil?			**X**	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?		**X**		
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?		**X**		
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?			**X**	
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?		**X**		

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. The General Plan EIR identified potential risks associated with ground and earthquake fault rupture in the southwest portion of the Tracy planning area that would include the project area and is anticipated to occur within the buildout timeframe of the General Plan. Fault rupture can occur along or immediately adjacent to faults during an earthquake. Fault rupture is characterized by ground cracks and displacement which would endanger life and property. Damage is typically limited to areas close to the moving fault. While the project site is located in an area that would be susceptible to low to moderate seismicity, no known active faults cross the project site, and the project site is not located within an Alquist-Priolo Earthquake Fault Zone (CDOC, 2022).

The nearest earthquake fault to the project site that is zoned as active by the State of California Geological survey and mapped by the CDOC, is the Black Butte Fault. This fault is located approximately 3.0 miles southwest of the intersection of Corral Hollow Road and Linne Road.

According to the City General plan EIR, the City of Tracy has a low to moderate seismic history and the largest recorded measurable magnitude earthquake measured 3.9 on the Richter Scale. In addition, relatively large earthquakes have historically occurred in the Bay Area (approximately 50 miles to the west) and along the margins of the Central Valley.

The proposed project includes infrastructure, specifically roadway improvements and does not propose the construction of any habitable structures and it would not result in any greater impact than detailed in the General Plan EIR. In addition, as part of the design and approval process, the proposed project would be subject to mitigation measure (MM-GEO-1), which requires site specific design-level geotechnical investigations pursuant to General Plan Safety Element Policy Objective SA-1.1, P2. This requires that geotechnical engineering studies be undertaken for any development in areas where potentially serious geologic risks exist. Although, the project is not anticipated to be substantially affected it would be evaluated for the risk of impacts from seismic activity. Therefore, because the site is not located within an area with known risk of fault rupture and would undergo a geologic hazards investigation to evaluate other potential geologic hazards (discussed below), impacts would be less than significant in this regard.

ii) Strong seismic ground shaking?

Less Than Significant Impact. As discussed above. The City has a low to moderate seismic history and a 3.9 magnitude earthquake is the largest recorded measurable earthquake. When an earthquake occurs, it can result in ground-shaking effects and the impacts can be widespread. Although a function of earthquake intensity, ground shaking effects can be magnified by the underlying soils and geology, which may amplify shaking at great distances it is difficult to predict

the magnitude of ground-shaking following an earthquake. The effects can vary widely in a relatively small area, and different project sites susceptible to ground shaking from faults in the region can differ based on numerous factors. The greatest potential for significant ground shaking in Tracy is believed to be from maximum credible earthquakes occurring on the Calaveras, Hayward, San Andreas, or Greenville faults. In addition, seismic activity can be expected to occur along the western margin of the Central Valley. As with all projects in the area, the proposed project would be designed to accommodate strong earthquake ground shaking and would be designed and construction in compliance with the applicable California building code standards.

Other faults capable of producing ground shaking at the site include the San Joaquin fault, approximately 7 miles to the southern, the Midway fault approximately 7.2 miles to the southwest, and the Corral Hollow-Carnegie fault approximately 11 miles to the southwest. Any of these faults could generate an earthquake capable of causing strong ground shaking experienced at the project site. Earthquakes of Moment Magnitude (Mw) 7 and larger have historically occurred in the region and numerous small magnitude earthquakes occur every year.

In addition, an earthquake of moderate to high magnitude from a fault within the San Francisco Bay Region and along the margins of the Central valley could cause ground shaking at the project site, similar to what has occurred in the past. To minimize potential damage to the proposed project caused by ground shaking, all construction would comply with the latest California Building Code standards, as required by the City of Tracy Municipal Code 9.04.030.

Seismic design provision of current building codes generally prescribes minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead-and-live loads. The code-prescribed lateral forces are generally considered substantially smaller than the comparable forces that would be associated with a major earthquake. Therefore, structures should be able to: (1) resist minor earthquakes without damage, (2) resist moderate earthquakes without structural damage but with some nonstructural damage, and (3) resist major earthquakes without collapse but with some structural as well as nonstructural damage. Use of the California Building Code standards, which include provision for seismic building designs, would ensure that impacts associated with ground shaking would be less than significant.

The Safety Element of the Tracy General Plan includes several goals, objectives and policies to reduce the risks to the community from earthquakes and other geologic hazards. In particular, the following policies would apply to the project site:

> *SA-1.1, Policy P2: Geotechnical reports shall be required for development in areas where potentially serious geologic risks exist. These reports should address the degree of hazard, design parameters for the project based on the hazard, and appropriate mitigation measures.*
>
> *SA-1.2, Policy P1: All construction in Tracy shall conform to the California Building Code and the Tracy Municipal Code including provisions addressing unreinforced masonry buildings.*

The City would review the proposed project as it does all projects for consistency with the General Plan policies and California Building Code provisions identified above and as applicable. This review would occur during the project application review and processing stage and throughout plan check and building inspection phases. Since the majority of work under the scope of this project involves

roadway improvements, the relevant Caltrans, State, and FHWA codes and requirements would be used.

Consistency with the requirements of the California Building Code and the Tracy General Plan policies identified above would ensure that impacts on humans associated with seismic hazards would be less than significant and additional mitigation would not be required.

iii) Seismic-related ground failure, including liquefaction?

Potentially Significant Unless Mitigation Incorporated. Seismically induced liquefaction occurs when loose, water-saturated sediments of relatively low density are subjected to cyclic shaking that causes soils to lose strength or stiffness because of increased pore water pressure. The project does not fall within any liquefaction zones identified in the Seismic Hazards Map by the California Geological Survey (DOC, 2017). During an earthquake, ground shaking may cause certain types of soil deposits to lose shear strength, resulting in ground settlement, oscillation, loss of bearing capacity, landslides, and the buoyant rise of buries structures. The majority of liquefaction hazards are associated with sandy soils, silty soils of low plasticity, and some gravelly soils. Cohesive soils are generally not considered to be susceptible to liquefaction. In general, liquefaction hazards are more severe within the upper 50 feet of the surface, except where slope faces or deep foundations are present.

Expansive soils are those that undergo volume changes as moisture content fluctuates; swelling substantially when wet or shrinking when dry. Soil expansion can damage structures by cracking foundations, causing settlement and distorting structural elements. Expansion is a typical characteristic of clay-type soils. Expansive soils shrink and swell in volume during changes in moisture content, such as a result of seasonal rain events, and can cause damage to foundations, concrete slabs, roadway improvements, and pavement sections.

Soil expansion is dependent on many factors. The more clayey, critically expansive surface soil and fill material are subjected to volume changes during seasonal fluctuations in moisture content. According to the City of Tracy General Plan Draft EIR, portions of the Tracy Planning Area have a moderate to high risk for expansive soils. The General Plan EIR indicates that with the implementation of objectives, policies, and actions from the General Plan Safety Element, this potentially significant impact would be reduced to less than significant.

The project site is not designated within one of the above zones and the soils in the Tracy area are not considered to be susceptible to liquefaction, even though the groundwater is high, because the near surface soils are predominantly clays or sands with high silt and clay content (San Joaquin County, 1992). In addition, new roadways and infrastructures included in the project would be required by State law to be constructed in accordance with all applicable IBC and CBC earthquake construction standards, including those relating to soil characteristics, and adherence to **MM GEO-1**. The potential for substantial adverse effects to the project due to seismic-related ground failure, including liquefaction would therefore be less than significant.

MM GEO-1: Prior to earthmoving activities, a certified geotechnical engineer, or equivalent shall be retained to perform a final geotechnical evaluation of the soils at a design level. The final geotechnical evaluation shall include design recommendations to

ensure that soils conditions do not pose a threat to the health and safety of people or structures. The grading and improvement plans shall be designed in accordance with the recommendations provided in the final geotechnical evaluation.

iv) Landslides?

Less Than Significant Impact. The project site is relatively flat and does not have any substantial slopes and is not adjacent to an area with substantial slopes. According to the City's General Plan EIR, the landslide risk in Tracy is low in most areas including the project site and the potential for risks from landslides is similarly low. The project site is not located along riverbanks, foothills, or mountain terrain, that would make it susceptible to landslides. As such, the project site is exposed to little or no risk from landslides, impacts would be less than significant, and mitigation is not required.

b) Result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. The construction and grading associated with site preparation and construction of the project would remove existing orchard vegetation and hardscape. Most of the other project areas adjacent to the roadways and within the roadway shoulders contain very limited vegetative cover to impede runoff. Nonetheless, construction activities would temporarily increase the exposure of soils to water and wind erosion. Dust Control Measures mentioned in Chapter 3, Air Quality, which include watering of the project site and haul roads, would also help to prevent the loss of topsoil. The potential effects from uncontrolled erosion include impacts on water quality and air quality. Exposed soils that are not properly contained or capped increase the potential for increased airborne dust and increased discharge of sediment and other pollutants into nearby stormwater drainage facilities. Risk associated with erosive soils could be reduced by using appropriate controls during construction and properly re-vegetating exposed areas.

As noted above in Section 3.2 Air Quality, compliance with City of Tracy General Plan Air Quality Element would require the implementation of various dust control measures during site preparation and construction activities. In addition to these measures that would reduce the potential for soil erosion and the loss of topsoil, because the proposed project would disturb more than an acre of land it would be required to obtain a Construction General Permit from the SWRCB. The Construction General Permit would require preparation of a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP would include implementation of BMPs to avoid or minimize adverse water quality impacts from erosion and sedimentation. BMPs fall within the categories of Temporary Soil Stabilization, Temporary Sediment Control, Wind Erosion Control, Tracking Control, Non-Storm Water Management, and Waste Management and Materials Pollution Control.

With these erosion control measures in place, impacts resulting from construction and operational activities would be minimized and project level impacts related to erosion would be less than significant and additional mitigation is not required.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Potentially Significant Unless Mitigation Incorporated. The project site and surround areas are generally flat, which is not anticipated to result in liquefaction, lateral spreading, landslides, or collapse.

Liquefaction also discussed above in *a) iii),* results from the loss of strength during cyclic loading and can occur during ground shaking created by movement on faults. Soils most susceptible to liquefaction are clean, loose, saturated, uniformly graded and fine-grained sands. The City of Tracy General Plan Draft EIR notes that the central portion of the Tracy Planning Area is moderately susceptible to liquefaction. While the proposed project occurs in the southwesterly portion of the planning area, it would nonetheless be implemented in conformance to the objectives, polices, and actions of the General Plan Safety Element. This, in conjunction with the site-specific geotechnical report, which would address potential for liquefaction and include remedies, if needed, such as excavation, mixing, and recompaction of soils, would ensure impacts remain less than significant.

Lateral spreading typically results when ground shaking moves soils toward an area where soil integrity is weak or unsupported, and it typically occurs on the surface of a slope, although it does not occur strictly on steep slopes. Oftentimes, lateral spreading is directly associated with areas susceptible to liquefaction. This potential is considered low because the project site is not adjacent to or in an elevated area that could be affected by spreading. Potential effect would be further reduced by conformance with the goals, polices, and implementation measures from the General Plan Safety element and any recommendations contained in the site-specific geotechnical report.

Collapsible soils undergo a rearrangement of their grains and a lot of cementation, resulting in substantial and rapid settlement under relatively low loads. Collapsible soils occur predominantly at the base of mountain ranges, where Holocene-age alluvial fan and wash sediments have been deposited during rapid run-off events. Differential settlement of structures typically occurs when heavily irrigated landscape areas are near a building foundation. Examples of common problems associated with collapsible soils include tilting floors, cracking or separation in structures, sagging floors, and nonfunctional windows and doors. Soil data from the NRCS Web Soil Survey suggests the project site is underlain by Zacharias clay loam (0 to 2 percent slopes) and based on the characteristics of the soils (NRCS, 2022) and its location approximately 10 miles east of the base of the coast range, would have a low potential for collapsible soils on the project site. Therefore, implementation of the proposed project would result in a less than significant impact in this regard (City of Tracy, 2020).

Land subsidence is the gradual settling or sinking of an area with little or no horizontal motion due to changes taking place underground. It is a natural process, although it can also occur as a result of human activities. Common causes of land subsidence from human activity including pumping water, oil, and gas, and other mining activities from underground reservoirs leaving voids that can be collapse when exposed to seismic activity. However, subsidence is not anticipated at the project site as there are no active oil or gas well in proximity to the project. The nearest well to the project

site is located approximately 0.75 miles to the northwest and is capped (Calgem, 2022). In addition, the proposed project largely overlays an existing roadway and there are no water wells within the alignment. Lastly, as previously discussed, conformance with General Plan policies goals objectives and implementation measures, as well as conformance with the requirements set forth in the site-specific geotechnical report, required in **MM GEO-1,** would ensure these impacts are less than significant.

As previously mentioned, the project site does not overlay any active faults and is not in a liquefaction zone. Therefore, the potential for lateral spreading, subsidence, liquefaction, or collapse is low. To further prevent the above adverse effects all project components would be constructed in accordance with applicable City goals and policies as detailed in the General Plan and implementation of any recommendation contained in the site-specific geotechnical report. In addition, all construction plans and related geotechnical plans and studies would be reviewed by the City further ensuring compliance with all building construction standards. Compliance with all construction standards would reduce the potential for an off-site landslide, lateral spreading, subsidence, liquefaction or collapse and reduce the impacts to a less than significant level.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Potentially Significant Unless Mitigation Incorporated. Expansive soils are those that undergo volume changes as moisture content fluctuates; swelling substantially when wet or shrinking when dry. Soil expansion can damage structures by cracking foundations, causing settlement and distorting structural elements. Expansion is a typical characteristic of clay-type soils. Expansive soils shrink and swell in volume during changes in moisture content, such as a result of seasonal rain events, and can cause damage to foundations, concrete slabs, roadway improvements, and pavement sections. Soil expansion is dependent on many factors. The more clayey, critically expansive surface soil and fill materials will be subjected to volume changes during seasonal fluctuations in moisture content. There are no expansive (i.e. shrink-swell) soils within the project site. According to the USDA Web Soil survey, the project site contains approximately 85% Zacharias and similar soils with 15% minor components (USDA, 2022). Given the soils identified on site, adherence to applicable Federal, State, and Local rules and regulations, and compliance with **MM GEO-1** impacts would be a less than significant impact.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Less Than Significant Impact. The proposed project is a roadway improvements project and does not include any habitable structures that would require wastewater disposal. The proposed project does not include any elements of an alternative wastewater disposal system.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Unless Mitigation Incorporated. There are no known paleontological resources located in project area. However, development of the proposed project could result in

the discovery and disturbance of previously unknown or undiscovered paleontological resources. While fossils are not expected to be discovered during construction, it is possible that significant fossils could be discovered during excavation activities.

Even in areas with a low likelihood of occurrence. Fossils encountered during excavation could be inadvertently damaged. If a unique paleontological resource is discovered, the impact to the resource could be substantial. **MM GEO-2** would require that a qualified paleontologist monitor grading and excavation activities, and a paleontologist be notified if paleontological resources are found. If any scientifically important large fossil remains are uncovered, the paleontologist would have the authority to divert heavy equipment away from the fossil site. With implementation of **MM GEO-2** and consistency with City ordinances, policies and goals, impacts associated with paleontological resources would be less than significant.

MM GEO-2: **Paleontological Resources.** If paleontological resources are discovered during the course of construction, work shall immediately halt within 50 feet of the discovery and the City of Tracy shall be notified. A qualified paleontologist shall be retained to determine the significance of the discovery. If the paleontological resource is considered significant, a recovery and preservation plan shall be developed by the qualified paleontologist and the resource shall be donated to a local agency, State University, or other applicable institution, where the resources can be studies, curated, and displayed for public education purposes if applicable. and implemented.

Cumulative Impacts

Geology and soil-related impacts are generally site-specific and are determined by a particular site's soil characteristics, topography, and proposed land uses. Cumulative effects related to geology resulting from the implementation of proposed improvements would not expose more persons and property to a substantial increase in the potential to be affected by impacts due to seismic activity and construction of the project would not exacerbate existing geotechnical hazards. Long-term impacts related to geology include the exposure of people to the potential for seismically induced ground shaking. While implementation of the proposed project, taken in conjunction with other past present and reasonably foreseeable projects, the proposed project would not increase the number of people and structures subject to a seismic event or increase the potential for such events to occur. In addition, seismic and geologic significance are considered on a project-by-project basis typically through the preparation of a design-level geotechnical studies, and conformance to applicable policies related to design and conformance to applicable building codes. As such exposures are anticipated to be minimized through strict engineering guidelines that provide protection against known geologic hazards and potential geologic and soil related impacts. Thus, the proposed project would not contribute to a cumulatively considerable geologic and/or soils impacts and impacts would be less than significant.

GREENHOUSE GAS EMISSIONS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
8. GREENHOUSE GAS EMISSIONS. Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			**X**	
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			**X**	

REGULATORY SETTING

Federal

To date, national standards have not been established for nationwide greenhouse gas (GHG) reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding. The U.S. Environmental Protection Agency's (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in Massachusetts v. EPA (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the EPA finalized an

endangerment finding in December 2009. Based on scientific evidence, it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the EPA's assessment of the scientific evidence that form the basis for the EPA's regulatory actions.

Federal Vehicle Standards. In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the EPA is currently proposing to freeze the vehicle fuel efficiency standards at their planned 2020 level (37 mpg), canceling any future strengthening (currently 54.5 mpg by 2026).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baseline.

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program.

In 2018, the President and the EPA stated their intent to halt various federal regulatory activities to reduce GHG emission, including the phase two program. California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives. On September 27, 2019, the EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.) The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March

31, 2020, the EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration has repealed SAFE Rule Part One, effective January 28, 2022 and is reconsidering Part Two pursuant to Presidential Executive Order 13390 issued on January 20, 2021.

State

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2e in the world and produced 440 million gross metric tons of CO_2e in 2015. In the state, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark AB 32 California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major legislation related to GHG emissions reduction.

Assembly Bill 32 (California Global Warming Solutions Act of 2006). AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

CARB Scoping Plan. CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual"). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the state's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines the adopted role of a cap-and-trade program. Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan include:

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
- Achieving a statewide renewables energy mix of 33 percent by 2020.

- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).
- Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gasses with high global warming potential, and a fee to fund the administrative costs of California's long-term commitment to AB 32 implementation.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated considering current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated state-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarizes the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identifies the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32. By 2016, California had reduced GHG emissions below 1990 levels, achieving AB 32's 2020 goal four years ahead of schedule.

In January 2017, CARB released the 2017 Climate Change Scoping Plan Update (Second Update) for public review and comment (CARB, 2017). The Second Update sets forth CARB's strategy for achieving the state's 2030 GHG target as established in Senate Bill (SB) 32 (discussed below). The Second Update was approved by CARB's Governing Board on December 14, 2017.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit. Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017, CARB adopted a second update to the Scoping Plan (CARB, 2017b). The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping Plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support the Clean Power Plan and other Federal actions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008). Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies. The applicable sustainable community strategy in the Bay Area is Plan Bay Area 2040.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards). AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards). SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the state. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078 and SBX1-2 (Renewable Electricity Standards). SB 1078 required California to generate 20 percent of its electricity from renewable energy by 2017. This goal was accelerated with SB 107, which changed the due date to 2010 instead of 2017. On November 17, 2008, Executive Order S-14-08 established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SB X1-2 codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015). Signed into law on October 7, 2015, SB 350 implements the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the

procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 45 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms). Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans). Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases). Signed into Law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the state's tone and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce greenhouse gas emissions to 2000 levels.
- By 2020, reduce greenhouse gas emissions to 1990 levels.
- By 2050, reduce greenhouse gas emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S-01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the

Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the state's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the state come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewable Portfolio Standard (RPS) to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e ($MMTCO_2e$). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the state's climate adaptation plan to be updated every three years and for the state to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Regional

San Joaquin Valley Air Basin Air Quality Management District Thresholds

The proposed project lies within the northern portion of the San Joaquin Valley Air Basin (SJVAB). The San Joaquin Valley Air Pollution Control District (SJVAPCD) has jurisdiction over most air quality matters in the SJVAB and is tasked with implementing programs and regulations required by the federal and State Clean

Air Acts. According to the SJVAPCD, impacts are less than significant if a project complies with adopted statewide, regional, or local plan for reduction or mitigation of GHG emissions.

Under CEQA, the SJVAPCD is a commenting responsible agency on air quality within its jurisdiction or impacting its jurisdiction. The SJVAPCD reviews projects to ensure that they would: (1) support the primary goals of the latest Air Quality Plan; (2) include applicable control measures from the Air Quality Plan; and (3) not disrupt or hinder implementation of any Air Quality Plan control measures.

Local

City of Tracy Sustainability Action Plan

The City of Trace adopted a Sustainability Action Plan (SAP) on February 1, 2011. The SAP, consistent with the recommendations of the CARB Scoping Plan, establishes a GHG reduction goal of 29 percent of community and municipal GHG emissions from 2020 business-as-usual (BAU) projected levels. The SAP provides a long-range strategy to achieve sustainability in the sectors of GHG emissions, energy, transportation and land use, solid waste, water, agriculture and open space, biological resources, air quality, public health, and economic development. The SAP reduction targets are based on the following objectives:

- 20 percent increase in the percentage of City employees who participate in travel demand management programs from 2006 levels.
- 20 percent increase in the percentage of non-City employees who participate in travel demand management programs from 2006 levels.
- 20 percent reduction in the municipal vehicle miles traveled (VMT) from 2006 levels.
- 20 percent reduction in the community VMT per capita from 2006 levels.

City of Tracy Municipal Code

The City's Municipal Code includes the following regulations that would reduce GHG emissions from future development:

- Green Building Standards Code (Chapter 9.14)
- Energy Code (Chapter 9.64)
- Water Management (Chapter 11.28)

City of Tracy General Plan

The General Plan includes the following GHG reduction policies, which are applicable to the project.

Objective LU-9.1 Undertake measures to reduce greenhouse gas emissions and improve the sustainability of actions by City government, residents and businesses in Tract.

P1: The City shall maintain, implement and monitor the Sustainability Action Plan, and adjust the Sustainability Action Plan as needed based on monitoring results and as funding becomes available.

Objective CC-2 Maximize direct pedestrian, bicycle and vehicle connections in the city.

Objective CC-2.2 Provide connections that reinforce the role and function of the Building Blocks within the City.

P1: The Downtown and Village Centers shall have direct pedestrian, bicycle and vehicular connections to all Neighborhoods or development projects within an Employment Area.

P2: Neighborhoods shall have direct pedestrian, bicycle and vehicular connections to their Focal Points and Village Center, compatible with the character, circulation network, and general configuration of the neighborhoods.

P3: As existing areas redevelop and change over time, new and increased connections to Focal Points and retail areas shall be developed.

P5: Streets shall be continuous within and between Neighborhoods, including those that are built by different developers or builders.

Objective CIR-1.2 Provide a high level of street connectivity.

P1: The City shall ensure that the street system results in a high level of connectivity, especially between residences and common local destinations, such as schools, Village Centers, retail areas and parks. The standard for roadway (vehicular) connectivity is defined as appropriate spacing of arterials and collectors and local roads as detailed above in Section B of this Element "Roadway Classifications and Standards."

P2: The City shall implement a connected street pattern with multiple route options for vehicles, bikes and pedestrians.

P3: New development shall be designed to provide vehicular, bicycle and pedestrian connections with adjacent developments.

Objectives CIR-1.8: Minimize transportation-related energy use and impacts on the environment.

P1: Transportation projects shall avoid disrupting sensitive environmental resources.

P2: When possible, road construction and repair projects shall use sustainable materials.

P3: The City shall encourage the use of non-motorized transportation and low-emission vehicles.

Objective CIR-3.1: Achieve a comprehensive system of city-wide bikeways and pedestrian facilities.

P1: The City shall incorporate appropriate bicycle and pedestrian facilities on all roadways constructed by the City, Class I to the extent feasible.

P2: To the extent possible, the City shall separate vehicular from bicycle and pedestrian traffic on higher-speed and higher-volume roadways through the use of off-street bicycle and pedestrian facilities.

P3: The City may separate bicycle from pedestrian users on high usage bicycle and pedestrian paths.

P4: The City's bicycle and pedestrian system shall have a high level of connectivity, especially between residences and common local destinations, such as schools, shopping and parks. A higher level of bicycle and pedestrian connectivity is defined as a shorter or similar distance to common destinations for bicycles and pedestrians compared to distances for vehicles.

Objective AQ-1.1: Improve air quality and reduce greenhouse gas emissions through land use planning decisions.

Objective AQ-1.2: Promote development that minimizes air pollutant and greenhouse gas emissions and their impact on sensitive receptors as a result of indirect and stationary sources.

P1. The City shall assess air quality impacts using the latest version of the CEQA Guidelines and guidelines prepared by the San Joaquin Valley Air Pollution Control District.

P2. The City shall assess through the CEQA process any air quality impacts of development projects that may be insignificant by themselves, but cumulatively significant.

P3. Developers shall implement best management practices to reduce air pollutant emissions associated with the construction and operation of development projects.

P13. Dust control measures consistent with San Joaquin Valley Air Pollution Control District rules shall be required as a condition of approval for subdivision maps, site plans, and all grading permits.

P14. Developments that significantly impact air quality shall only be approved if all feasible mitigation measures to avoid, minimize or offset the impact are implemented.

Objective AQ-1.3: Provide a diverse and efficient transportation system that minimizes air pollutant and greenhouse gas emissions.

P1. The City shall continue to work with the San Joaquin Council of Governments on regional transportation solutions.

THRESHOLDS

According to the SJVAPCD, impacts are less than significant if a project complies with adopted statewide, regional, or local plan for reduction or mitigation of GHG emissions. The vast majority of individual projects do not generate sufficient GHG emissions to create a project-specific impact through a direct influence on climate change; therefore, the issue of climate change typically involves an analysis of whether a project's contribution towards an impact is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects (CEQA Guidelines, Section 15355).

The SJVAPCD has evaluated different approaches for estimating impacts and summarizing potential GHG emission reduction measures. The SJVAPCD staff has concluded that "existing science is inadequate to support quantification of impacts that project specific GHG emissions have on global climatic change." This is readily understood when one considers that global climatic change is the result of the sum total of

GHG emissions, both man-made and natural that occurred in the past; that is occurring now; and will occur in the future. The effects of project specific GHG emissions are cumulative, and unless reduced or mitigated, their incremental contribution to global climatic change could be considered significant.

The *Final Draft Guidance for Assessing and Mitigating Air Quality Impacts* (SJVAPCD, 2015) provides an approach to assessing a project's impacts on greenhouse gas emissions by evaluating the project's emissions to the "reduction targets" established in ARB's AB 32 Scoping Plan. For instance, the SJVACD's guidance recommends that projects should demonstrate that "*project specific GHG emissions would be reduced or mitigated by at least 29%, compared to Business as Usual (BAU), including GHG emission reductions achieved since the 2002-2004 baseline period, consistent with GHG emission reduction targets established in ARB's AB 32 Scoping Plan. Projects achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG*."

Subsequent to the SJVAPCD's approval of the *Final Draft Guidance for Assessing and Mitigating Air Quality Impacts* (SJVAPCD 2015), the California Supreme Court issued an opinion that affects the conclusions that should/should not be drawn from a GHG emissions analysis that is based on consistency with the AB 32 Scoping Plan. More specifically, in *Center for Biological Diversity v. California Department of Fish and Wildlife*, the Court ruled that showing a "project-level reduction" that meets or exceeds the Scoping Plan's overall statewide GHG reduction goal is not necessarily sufficient to show that the project's GHG impacts will be adequately mitigated: "*the Scoping Plan nowhere related that statewide level of reduction effort to the percentage of reduction that would or should be required from individual projects...*" According to the Court, the lead agency cannot simply assume that the overall level of effort required to achieve the statewide goal for emissions reductions will suffice for a specific project.

Given this Court decision, reliance on a 29 percent GHG emissions reduction from projected BAU levels compared to a project's estimated 2020 levels as recommended in the SJVAPCD's guidance documents will not be the basis for an impact conclusion in this EIR. Given that the SJVAPCD staff has concluded that "*existing science is inadequate to support quantification of impacts that project specific GHG emissions have on global climatic change*," this analysis instead relies on a qualitative approach to evaluate the project's GHG impacts. Specifically, the analysis relies on an assessment of the proposed project for consistency with relevant planning documents and relevant laws is provided herein.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impact.

Short-Term Construction Greenhouse Gas Emissions

Construction of the project would result in direct emissions of CO_2, N_2O, and CH_4 from the operation of construction equipment and the transport of materials and construction workers to and from the project site. SJVAPCD does not have a threshold for construction GHG emissions, which are one-time, short-term emissions and therefore would not significantly contribute to long-term cumulative GHG emissions impacts of the proposed project. However, the SJVAPCD advises that construction GHG should be disclosed and a determination on the significance of construction

GHG emissions in relation to meeting AB 32 GHG reduction goals should be made. Total GHG emissions generated during all phases of construction were combined and are presented in *Table 4-5: Construction Greenhouse Gas Emissions*. The RCEM outputs are contained within the Appendix A.

Table 4-5: Construction Greenhouse Gas Emissions

Year	$MTCO_2e$[1]
2024	164.82
Total	164.82
Amortized	5.49
$MTCO_2e$ = metric tons of carbon dioxide equivalent. Source: SMAQMD, Road Construction Emissions Model version 9.0.0. Refer to Appendix A for model outputs.	

As shown in *Table 4-5*, project construction-related activities would generate approximately 164.82 $MTCO_2e$ of GHG emissions over the course of construction. One-time, short-term construction GHG emissions are typically summed and amortized over the project's lifetime (assumed to be 30 years). The amortized project emissions would be approximately 5.49 $MTCO_2e$ per year. Once construction is complete, the generation of construction-related GHG emissions would cease.

Long-Term Operational Greenhouse Gas Emissions

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased trips or vehicle miles traveled. Therefore, increase in operational emissions is not anticipated.

As discussed in impact b), below, the proposed development would be constructed in compliance with the City's SAP. The proposed project, therefore, would be consistent with the City's GHG reduction measures and General Plan and would have a less than significant GHG emissions impact.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant Impact.

City of Tracy Sustainability Action Plan Consistency

The City's SAP establishes a GHG emission reduction target that is based on SJVACPD threshold of a 29 percent reduction from BAU emissions. The City's target was also developed following a review of sustainability targets set by other entities, such as the Attorney General's Office, and have been refined iteratively and concurrently with the sustainability measures. The proposed project's consistency with applicable SAP measures is assessed in *Table 4-6: City of Tracy SAP Consistency* below. As shown in *Table 4-6*, the project would be consistent with applicable SAP measures and would not hinger its implementation or effectiveness. As the project would be consistent with the City's SAP, impacts in this regard would be less than significant.

Table 4-6: City of Tracy SAP Consistency

SAP Measures	Project Consistency
E-7: Energy Efficient Retrofits for City Street Lights. Retrofit City street lights to LED or induction lighting.	**Consistent.** The proposed project would conform to City of Tracy standards for street lighting that establish requirements for the use of LED lighting.
T-5.e: Smart Growth, Urban Design and Planning. Add to the Transportation Master Plan a program to close sidewalk gaps on key routes within the developed city, contingent on grant funding.	**Consistent.** New sidewalk and curb and gutter would be installed along Corral Hollow Road north of Linne Road to connect to the existing pedestrian network. In addition, a traffic signal and crosswalks would be installed to further improve the pedestrian network.
SW-1: Diversion of Construction Waste from Landfills. Amend the Municipal Code to require at least 50 percent diversion (i.,e. reuse or recycling) of non-hazardous construction waste from disposal.	**Consistent.** The project would not conflict with implementation of this measure. The project is required to achieve the recycling mandates via compliance with the CALGreen code.
Source: City of Tracy, *Sustainability Action Plan*, February 1, 2011.	

Cumulative Impacts

It is generally the case that an individual project of the project's size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of project-related GHG emissions would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. In addition, the project as well as other cumulative related projects, would be subject to all applicable regulatory requirements, which would further reduce GHG emissions. As discussed in GHG-2 discussion above, the project would be consistent with the City's SAP. Thus, the project would not conflict with any GHG reduction plan. Therefore, the project's cumulative contribution of GHG emissions would be less than significant and the project's cumulative GHG impacts would also be less than cumulatively considerable.

HAZARDS AND HAZARDOUS MATERIALS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
9. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			**X**	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?		**X**		
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			**X**	
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?			**X**	
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?			**X**	
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			**X**	
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?			**X**	

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. Construction equipment and construction activities include the use paints and solvents and other petroleum-based products, typically used for on-site construction

equipment and that would be used for the proposed project. These materials would be used during site preparation, removal activities, grading, paving of the new roadways, installation of curb and gutter, utility installation and other construction activities. Heavy construction equipment would be used for excavation and removals of existing hardscape. The use of these materials and equipment is typical for this type of construction and typically do not typically represent a substantial risk when property used. However, if an accident or a release does occur, a spill of these materials could pose a threat to human health and safety and could contaminate water, species habitat, and/or agricultural resources.

Any potentially hazardous materials such as fuels, greases, lubricants, solvents, or other materials would be used during construction of the proposed project would be handled on-site in accordance with applicable recommendation and safe handling requirements. The use or handling of these potentially hazardous materials would be short-term only during the construction phase of proposed project. The transport, removal, and disposal of hazardous materials on the project site would be conducted by a permitted and licensed service provider consistent with federal, state, and local requirements including the EPA, the California Department of Toxic Substances Control (DTSC), the California Occupational Safety and Health Administration (Cal/OSHA), Caltrans, the Resource Conservation and Recovery Act, and the City of Tracy fire department through the Conditionally Exempt Small Quantity Generator (CESQG) Program. With the compliance with local, state, and federal regulations short-term construction impacts associated with the handling, transport, use, and disposal of hazardous materials would be less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Potentially Significant Unless Mitigation Incorporated. As previously mentioned, the project site is within an existing roadway and previously disturbed undeveloped land and does not contain any known areas that have been reported to have experienced any hazardous materials incidents (see a) above and c), below.) for additional discussion.

The proposed project would occur within an existing roadway, but portions of the adjacent parcels that would be used and acquired are within existing agricultural, industrial, and railroad road right of way. In addition, the proposed project also would make minor modifications to the area containing a UPRR crossing of Corral Hollow Road within the northerly portion of the improvements. As search of both the Department of Toxic Substances Control (DTSC) Envirostor and California Water Boards Geotracker databases did not show any known hazards or previous hazardous releases within the project site (DTSC, 2022, and Waterboards, 2022). Nonetheless, there is the potential that unknown hazards exist below the ground surface and could be disturbed during construction activities. If such areas exist, and workers are exposed to substances, a risk to human health and safety could result. To minimize these effects, if materials are located during construction, work would cease in the area and the construction contractor would notify the City, City Fire Department, and DTSC, as applicable.

The use, clean up, and disposal of any potentially hazardous construction materials encountered during construction will be managed according to standard procedures to protect air quality, water

quality, and the environment as per state laws and is not expected to result in a reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. For example, in such event the project would be subject to the San Joaquin County Department of Environmental Health's Hazardous Materials Business Plan Program, which aims to protect the public health and safety and the environment by establishing business and area plans relating to the handling and release or threatened release of hazardous materials. If materials are located, the area would be evaluated and a clean-up plan would be implemented prior to resumption of construction activities in the vicinity. Mitigation Measure MM HAZ -1, would be implemented and further ensure impacts are less than significant.

Operation of the proposed project would not result in a hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The proposed project includes roadway widening, infrastructure, and associated improvements. The proposed project does not include any uses that would result in the generation or disposal of hazardous materials. While the roadway could be used by vehicles transporting materials, these vehicles would already be using the existing roadways and the project would not substantially increase the use of the roads for such activities. In addition, transport of hazardous materials would be done in accordance with regulations pertaining to their transport.

The needed grading is expected to be a balanced (even quantities of cut and fill) requiring no imported soil to backfill excavated areas. This would eliminate the potential risk of importing potentially contaminated soils to the project site. While the proposed project is not considered a sensitive land use, if imported fill materials are used, they the procedures outlined in the DTSC Information Advisory Clean Imported Material Fact Sheet would be followed. This would minimize the potential of introducing material that may result in a potential risk to human health or the environment at the project site. It should be noted, that fill material from undesirable commercial or industrial sites (e.g. former gasoline service stations, manufacturing facilities, etc.) would not be used. Fill materials would be sourced from nonindustrial areas, and not from sites undergoing an environmental cleanup per DTSC guidance.

A portion of the project site, the approximately 1.6 acres that would contain roadway improvements and the retention basin, and approximately 0.77 acres used for a temporary easement area are adjacent to the westerly alignment of Corral Hollow Road and in an area presently used as an orchard. DTSC has provided guidance related to the use of former agricultural land due the potential for such sites (used after 1950), to have used organochlorides for pest control. As noted in the DTSC Interim Guidance for Sampling Agricultural Properties, the guidance applies to proposed new and/or expanded school sites or other projects where a new land use could result in increased human exposure, especially residential use. The proposed project includes roadway improvements and does not include any habitable structures that would result in long term exposure. Future drivers that would use the roadway would be extremely transitory through the area and would not be exposed to any of the soils.

Thus, compliance with federal, state, and local regulations, the incorporation of the proposed project design features, and **MM HAZ-1**, belove, would reduce impacts associated with the

handling, transport, use, and disposal of hazardous materials and the release of hazardous materials into the environment would be less than significant

MM HAZ-1: In the event that hazardous materials are encountered during construction, the area will be evaluated by a qualified professional and a Soils management plan (SMP) shall be submitted and approved by the City/County of San Joaquin County Department of Environmental Health. The SMP shall require identification of the materials and shall establish management practices for the handling and disposal of the materials. Work shall not resume until the materials are removed and work is reauthorized by the City.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less Than Significant Impact. The proposed project would not create hazardous emissions or handle hazardous materials or increase the handling of materials or waste. The nearest school to the project site is Anthony Traina Elementary School approximately 0.5 miles to the northwest. There are no schools within 0.25 miles of the project site and as noted above the project would be in compliance with federal, state, and local regulations. As such, all preventive measures would be in place to limit the hazardous emissions and waste in such a way that would not impact the neighboring school. As such impacts are expected to be less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less than Significant Impact. There are no superfund sites or hazardous waste and substances sites (Cortese List) within the project site boundaries (DTSC, 2022a). Additionally, there are no known hazardous materials sites within the projects boundaries as identified on the State of California Geotracker Map (RWQCB, 2022) or on the DTSC Geotracker website (DTSC, 2022b). Therefore, a less than significant impact associated with hazardous materials sites would occur.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less than Significant Impact. The proposed project is located within the airport land use area for the Tracy Municipal Airport, which ls located approximately 0.5 miles southwest of the project site. The Tracy Municipal airport is owned and operated by the City of Tracy and is a general aviation airport that provides a range of aviation services jet fuel sales, and hangar and tie down rentals. None of the project areas are within Zone 1 – (Runway Protection Zone), but portions of the project site are located in Compatibility Zones 2 (Inner Approach/Departure Zone), and 3 (Inner Turning Zone), (San Joaquin County, 2018).

According to the Airport Land Use Compatibility Plan, certain actions, such as amendments to the general plan within the airport influence areas, changes to a master plan in the airport influence areas, etc., require mandatory ALUC review. The ALUC also lists 13 other actions that would render

a project potentially subject to ALUC review. Of the 13 project types, two would be potentially applicable to the proposed project and are shown below. :

- Proposals for new development (including buildings, antennas, and other structures) having a height of more than:
  - 35 feet within the Runway Project Zone or Inner Approach/Departure Zone;
  - 70 feet within Extended Approach/Departure Zone; or
  - 150 feet within Sideline Safety or Traffic Pattern Zone.
- Any project having the potential to create electrical or visual hazards to aircraft in flight, including"
  - Electrical interference with radio communications or navigational signals;
  - Lighting which could be mistaken for airport lighting;
  - Glare in the eyes of pilots using the airport; and
  - Impaired Visibility near the airport.

Although the project is not anticipated to use any signal masts of new streetlights greater than 35 feet in height that could inhibit the flight path of aircraft, and although the new lighting is not anticipated to be mistaken for airport lighting, due to the project's location, this document including a description of all proposed lighting and lighting mounts will be provided to the ALUC for their review. If the ALUC provides comments or suggestions needed to minimize potential conflicts, it would be included to the project. This coordination with the ALUC would ensure impacts remain less than significant.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The project site currently connects to an existing network of City streets. The proposed roadway widening and circulation improvements would allow for greater emergency access relative to existing conditions. During construction minor interruptions to service could occur, but full road closures are not anticipated and emergency services both for routine and emergency responses and evaluation would remain usable. Thus, the project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan and impacts would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less Than Significant Impact. The project site is not located within an area identified as having a high wildland fire potential. The project site is located in proximity to highly disturbed areas and not adjacent to any wildlands. To the west the project site would occur within a portion of an orchard but this area is not prone to experiencing wildfire. In 2008 CalFire determined that the County has no Very High Fire Hazard Severity Zones (VHFHSZ) within Local Responsibility Area (LRA) and there is no map showing VHFHSZ. Thus, the proposed project is not located in such an area and the proposed project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. A Less Than Significant impact would occur.

Cumulative Impacts

The incremental effects of the proposed project related to hazards and hazardous materials, if any, are anticipated to be minimal, and any effects would be site-specific. The proposed project is also not within an area classified as a VHFHSZ. Therefore, the proposed project would not result in incremental effects to hazards or hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed project would not result in cumulatively considerable impacts to or from hazards or hazardous materials.

HYDROLOGY AND WATER QUALITY

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
10. HYDROLOGY AND WATER QUALITY. Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?			**X**	
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?			**X**	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i) Result in substantial erosion or siltation on- or off-site?			**X**	
ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?			**X**	
iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?		**X**		
iv) Impede or redirect flood flows?			**X**	
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?			**X**	
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?			**X**	

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant Impact. The project site falls within the San Joaquin Valley Groundwater Basin. There are no surface waters or wetlands located on the project site per the National Wetlands Inventory (USFWS, 2022). The nearest surface water is the Delta-Mendota Canal which is located approximately 150 south of the southerly boundary of the project site. Thus, the proposed project does not contain any direct drainage connectivity to Waters of the US. During the project grading activities, trenching for utilities, and other standard ground-disturbing activities topsoil would be exposed. After grading and prior to overlaying the ground surface with the new roadway and impervious surfaces, the potential exists for wind and water erosion to discharge sediment and/or urban pollutants into stormwater runoff. If not properly controlled, this could adversely affect water quality.

In order to ensure that stormwater runoff from the project site does not adversely increase pollutant levels in adjacent surface waters and stormwater conveyance infrastructure, BMPs would be implemented. BMPs would be used to reduce the potential for pollutants in stormwater runoff from leaving the site. BMPs could include, but are not limited to, tracking controls, perimeter sediment controls, drain inlet protection, wind erosion/dust controls, and waste management control. The BMP's would be implemented in accordance with a site-specific Storm Water Pollution Prevention Plan (SWPPP), which would be developed to comply with the National Pollution Discharge Elimination System (NPDES).

The project also includes an approximate 0.35-acre retention basin. The retention basin would contain the surface water runoff and allow sediments to settle out prior to discharge of water. This project element in conjunction with the above compliance with and completion of NPEDS permit, SWPPP, BMPs, and conformance to applicable Federal, State, and Local regulations, the proposed project would have a less than significant impact related to water quality and water discharge requirements with conformance to the listed regulations. Additional mitigation would not be required.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less Than Significant Impact. The proposed project consists of roadway improvements and does not include uses such as residential, commercial, or industrial, that would result in a substantial increased the demand for water, including groundwater. During construction, a minimal amount of water would be used for construction and would be needed for activities such as watering bare ground for erosion control. Water, however, is anticipated to be supplied by existing City water supplies from existing waterlines within Corral Hollow and Linne Road.

In addition, while the proposed project would increase the volume of hardscape, the new areas would not be a substantial of volume such that the potential for groundwater would be significantly reduced. In addition, the proposed project includes a retention basin that would contain stormwater runoff, increase the time to discharge and increase the potential for infiltration and ground water recharge. Thus, impacts from project implementation and operation would be less than significant in this regard.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) Result in substantial erosion or siltation on- or off-site?

Less Than Significant Impact. Implementation of the proposed project would not alter a stream or a river. The existing roadway is a pervious surface and water drains to roadside ditches. The project improvements would increase impervious surfaces and incrementally increase the volume of stormwater runoff. As standard practice, the City requires post-project runoff to be equal to or less than pre-project runoff. The retention basin on the westerly side of Corral Hollow Road would help ensure the proposed project would not substantially increase the rate or amount of surface runoff. The retention basin would increase the time of concentration, facilitate recharge, and minimize the potential for flooding that could carry pollutants to off-site areas or other downstream receiving waters. In addition, as discussed in a), above. The proposed project would comply with the NPDES permit and implement a SWPPP with BMPs that would reduce the potential for substantial siltation and erosion.

ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?

Less Than Significant Impact. Related to the volumes of surface runoff, the proposed project would be subject to the requirements contained in the City of Tracy Municipal Code – Stormwater Management and Discharge Control which has the purpose of protecting and promoting the health, safety and general welfare of the citizens of the City by controlling non-stormwater discharges to the stormwater conveyance system. These requirements assist with protection of waterbodies through compliance with the Clean Water Act, Porter Cologne Water Quality Control Act, and NPDES permitting process.

To ensure the drainage plans are sufficient, the proposed project would be designed with a site-specific storm drainage plan and improvements would be made consistent with the overall storm drainage infrastructure approach presented in the 2012 City of Tracy Citywide Storm Drainage Master Plan. Prior to project approval, the City of Tracy Development Services Department and Utilities Department would review the storm-water improvement plans to ensure they would be adequate infrastructure capacity to collect and direct stormwater runoff to the conveyance system and to downstream areas such that flooding would not occur on-site or off-site. In addition, as discussed above, the project includes a retention basin on the westerly side of Corral Hollow Road that would contain water from storm events. Incorporation of these project design measures would ensure impacts are less than significant.

iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Potentially Significant Unless Mitigation Incorporated. To further reduce the potential for effect related to flooding and water runoff, the project also would include a SWPPP with BMPs to reduce

the potential for pollutants carried by stormwater from leaving the site and adversely affect downstream receiving water. The BMPs would reduce the volumes of disturbed soils, erosion, sediment, and pollutants from roadways to the extent feasible, to make their way into downstream waters. BMP's during both construction, such as the use of haybales, straw waddles, revegetation/hydroseeding, etc., and operations, such as the use of marked storm drains, filter socks, in drain screening media, etc., would be used during the two phases of the project. Mitigation Measure **MM HYD-1** would be implemented and would require the applicant to complete and coordinate a detailed storm drainage infrastructure plan with the City for review and approval. **MM HYD-1** would require a storm drainage plan to be designed and engineered to ensure that the post-project runoff is equal to or less than pre-project runoff and in on- off-site flooding impacts.

MM HYD-1: The proposed project's storm drainage infrastructure plan shall, to the satisfaction of the City engineer demonstrate adequate infrastructure capacity to collect and direct all stormwater generated on the project site to proposed stormwater conveyance system and demonstrate that the project will not result in-on or off-site flooding impacts. If the City engineer determines that the proposed stormwater drainage system would not be adequate, comments would be provided, and amendments to the plans shall be made to the engineer's satisfaction.

iv) Impede or redirect flood flows?

Less Than Significant Impact. The project site and surrounding areas are mapped in the San Joaquin County Flood Zone Viewer. The project area and surrounding vicinity are mapped within a Zone X. Zone X is defined as, "Areas determined to be outside the 0.2% annual chance (500-year) floodplain. The nearest mapped flood zone is approximately 1.0 miles to the southwest, south of the Tracy Boulevard crossing with the Mendota Canal. Thus, the proposed project located in an area with reduced flood risk and the proposed project would not impede or redirect flood flows. Impacts would be less than significant and mitigation is not required.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Less Than Significant Impact. The proposed project is located approximately 56 miles inland from the Pacific Ocean. As such, the potential for the project site to be inundated by a tsunami is remote. No steep slopes are located in the vicinity proposed project; therefore, the risk of mudflow is negligible. There are no adjacent or nearby contained bodies of water, except the Delta Mendota Canal, that would be affected by seiche or that could result in impacts to the project site. Impacts would be less than significant in this regard and mitigation is not required.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. As previously mentioned, the proposed project is within the San Joaquin Valley Groundwater Basin (SJVGWB). The SJVGWB is within the large San Joaquin River and Tulare Lake Hydrologic Regions. The northern portion of the basin is within the San Joaquin

River Hydrologic Region and consists of nine subbasins. The San Joaquin River Hydrologic Region of the basin covers approximately 5.15 million acres. Groundwater is used extensively in the San Joaquin Valley Groundwater Basin, primarily for agricultural and urban uses. This source accounts for approximately 48% of the groundwater used in the state.

San Joaquin Valley Regional Water Quality Control Board

The major source of recharge within the subbasin is from deep percolation of applied irrigation water and from canals and water storage facilities. Lesser groundwater recharge occurs from percolations from small streams, direct percolation of precipitation, and underflow down stream channels from the east including portions of the Stanislaus and Tuolumne rivers. In 2006, natural recharge to the subbasin was estimated at 86,000 acre-feet annually with an additional 92,000 acre-feet of recharge from applied water annually. Estimated annual extractions include 81,000 acre-feet for urban uses and 145,000 acre-feet for agricultural use. (CVRWQCB, 2006).

Eastern San Joaquin Integrated Regional Water Management Plan

The Eastern San Joaquin Integrated Regional Water Management Plan (IRWMP) defines and integrates key water management strategies to establish protocols and courses of action to implement the Eastern San Joaquin Integrated Conjunctive Use Program. The IRWMP was originally prepared in 2007, and updated in 2014, 2016, and most recently in 2020. Groundwater sustainability within the basin is based on 2014 state legislation enacted by the Sustainable Groundwater Management Act (SGMA) which was in response to overdraft conditions. Sustainability is generally defined as long-term reliability of the groundwater supply and the absence of undesirable result. Although the proposed project and Tracy is outside the ESJ Groundwater Management Area, Tracy receives treated Stanislaus River water through the South County Surface Supply Project and will be allocated up to 10,000 af/year.

Tracy Subbasin Groundwater Sustainability Plan

A Groundwater Sustainability Plan is being developed for the Tracy area. The GSA's have adopted the Final Tracy Subbasin Groundwater Sustainability Plan (GSP), which will be submitted to the California Department of Water Resources (DWR) who has up to two years to review. Prior to final approval the GSA will prepare an Annual Report for the subbasin. The Annual Report is due to the DWR by April 1, 2022 and every year thereafter. The GSAs will also continue to coordinate to monitor conditions in the Subbasin, implement projects and actions to manage the sustainability of the groundwater resources, and update the GSP every five years.

As previously discussed, the proposed project does include the construction of new roadway and hardscapes. While this would reduce the potential for recharge in these specific areas, the reduction would not be substantial. In addition, runoff from these areas would be conducted off-site to the stormwater drainage facilities which would enable ground water infiltration. In addition, the proposed project includes a retention basin which would contain stormwater run-off providing an opportunity for the water to infiltrate and recharge the aquifer. Lastly, the proposed project does not propose uses that would require ground water supplies that could reduce water volumes in the aquifer. Thus, the proposed project would not impede ground water recharge or conflict

with an applicable ground water management plan. Impacts would be less than significant and mitigation is not required.

Cumulative Impacts

The potential impacts related to hydrology and storm water runoff are typically site specific and site specific BMPs are implemented at the project level. The analysis above determined that the implementation of the proposed project would not result in significant impacts. In regard to proposed project impacts that would be considered less than significant, and impacts are not anticipated to result in compounded or increased impacts when considered with similar effects from other past, present, and reasonably foreseeable probable future projects. Other projects also would be subject to similar laws and requirements regarding hydrology practices, and would undergo evaluation and the development review process which would ensure their implementation.

Projects would be required to adhere to applicable General Plans goals, policies, and action statements; the City of Tracy's Municipal Zoning Code; the City's Standard Conditions of Approval; and the City's stormwater management guidelines regarding stormwater runoff and infrastructure. In addition, as discussed above, other projects would be required to implement stormwater pollution best management practices during construction and design measures to reduce water quality impacts and comply with the NPDES Municipal Regional Permit. Future developments in the watershed would also be required to comply with the SWRCB and RWQCB. Depending on the size of future projects, they would be required to obtain and comply with all required water quality permits and the Water Quality Control Plan, as needed and prepare and implement SWPPPS, implement construction BMPs, including BMPs to minimize runoff, erosion, and storm water pollution, comply with other applicable requirements. As part of these requirements, projects would be required to implement and maintain source controls, and treatment measures to minimize polluted discharge and prevent increases in runoff flows that could substantially decrease water quality. Conformance to these measures would minimize runoff from those sites and reduce contamination of runoff with pollutants. Therefore, related projects are not expected to cause substantial increases in storm water pollution. With compliance with State and local mandates, cumulative impacts would be less than significant, and project impacts would not be cumulatively considerable.

LAND USE AND PLANNING

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
11. LAND USE AND PLANNING. Would the project:				
a) Physically divide an established community?			**X**	
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?			**X**	

a) Physically divide an established community?

Less Than Significant Impact. The proposed project is located in the southwest portion of the City and would widen two existing roadways, Corral Hollow Road and Linne Road, make improvements within their intersection, improve the railroad crossing, install new signals and install new streetlights. Physical divisions of established communities, while they may be associated with roadway projects, typically occur when a new use is developed between two areas and severs or reduces a connection between the two. Projects that make travel between the areas more difficult can be considered to physically divide a community. The proposed project is surrounding by existing development including industrial, agriculture, and residential. The proposed project would increase the viability and ease of travel between these and other outlying areas by increased the improved roadway capacity and improving the Level of Service (LOS). Thus, the proposed project would not physically divide any surrounding communities and impacts would be less than significant. No mitigation is required.

The proposed project would result in the acquisition, see *Table 2 1: Project Parcels and Acquisition Areas*. This would consist of existing disturbed roadway and railroad shoulder and easement for railroad line. None of the areas within these parcels would affect any existing residential, businesses, or private structures, and railroad operations would not be affected. All improvements within the railroad easement would be made to ensure continued operations and improvements would be engineered so the existing rails, ties, and crossing are not substantially altered and remain functional. All improvements would be made through coordination with UPRR.

APN 025-311-020 and 025-302-112, would occur within an existing disturbed/mowed undeveloped portion of land that contains billboard, fencing, and gravel /dirt driveway used to access the structures on the property. The proposed project would not result in a taking of any of the existing habitable structures, but would result in the removal of some fencing, the billboard, and installation of a new concrete driveway to replace the dirt/gravel entrance. This also would result in the relocation of existing above ground powerlines but these are in existing right-of-way

on the road shoulder. Thus, while the proposed project would result in acquisition and change to the property, continued use and operation of the site would not be substantially inhibited. The property would still have ingress and egress in and to Corral Hollow Road and connectivity to off-site areas would be maintained.

A new retention basin (approximately 0.35 acres/15,400 sf) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. The proposed project would not affect ingress or egress from the project site and would not change any of the existing driveways. Removal of the billboard also would not result in a division. Lastly, due to the large size of the orchard, and relatively small number trees that would be removed, the orchard would remain viable and its use is anticipated to continue.

Thus, the acquisition and use of the listed properties would not be physically divided from other existing uses. Additionally, property owners for both uses would be compensated for the acquired property in accordance with City of Tracy policy. Thus, impacts in this regard would be less than significant and mitigation is not required.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact. The key planning documents that are directly related to, or that establish a framework for the development of the proposed project include the City of Tracy General Plan and Tracy Zoning Ordinance. The proposed project site is on land currently designated Commercial, Heavy Industrial, and Urban Reserve, and existing Linne Rd alignment and ROW in the General Plan and under the Zoning District Limited Industrial (IL), Railroad/UPRR ROW, Agriculture-Urban Reserve (AU). The project would be consistent with the City's zoning and General Plan land use designation upon approval of individual project specific use permits dependent on commercial use. The proposed project would not require any changes to any of the existing land uses that would result in impacts to the environment. In addition, the proposed project would not result in any conflicts with existing land use policies adopted for the purpose of avoiding or mitigation an environmental effect. Therefore, potential impacts are considered less than significant.

Cumulative Impacts

Implementation of the proposed project would not create a significant cumulative impact to the surrounding region since its surrounding area is planned for uses that are consistent with the widening of the roadway, installation of traffic signal, and other intersection improvements to improve existing traffic conditions and serve future planned uses. As a result, no cumulative impacts related to land use and planning would occur.

MINERAL RESOURCES

ENVIRONMENTAL IMPACTS Impact		Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
12.	**MINERAL RESOURCES. Would the project:**				
a)	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?			**X**	
b)	Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?			**X**	

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Less Than Significant Impact. As described in the Tracy General Plan EIR, the main mineral resources found in San Joaquin County, and the Tracy Planning Area, are sand and gravel (aggregate). These materials are primarily used for construction materials like asphalt and concrete. According to the California Geological Survey (CGS) evaluation of the quality and quantity of these resources, the most marketable aggregate materials in San Joaquin County are found in three main areas (San Joaquin County, 1992) that includes the following:

- In the Corral Hollow alluvial fan deposits of south Tracy.
- Along the channel and floodplain deposits of the Mokelumne River
- Along the San Joaquin River near Lathrop.

The proposed project is within the Corral Hollow area and would be located adjacent to an existing sand and gravel operation on the southeast corner of the Corral Hollow intersection with Linne Road. The proposed project would improve Linne Road adjacent to the northerly property boundary of the plant operations. The proposed project, however, would not occur within an area being actively mined or in an area in which mining would be expanded. In addition, the proposed project would not inhibit the continued use of the site for mineral extraction or concrete production. Therefore, the project would not result in the loss of availability of a known mineral resource. This impact is considered less than significant.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Less Than Significant Impact. The Surface Mining and Reclamation Act of 1975 (SMARA) requires classification of land into MRZs according to the known or inferred mineral potential of the area. Under SMARA, areas are categorized into MRZs as follows:

MRZ-1 Areas where the available geologic information indicates no significant mineral deposits or a minimal likelihood of significant mineral deposits.

MRZ-2 Areas where the available geologic information indicates that there are significant mineral deposits or that there is a likelihood of significant mineral deposits. However, the significance of the deposit is undetermined.

MRZ-3 Areas where the available geologic information indicates that mineral deposits are inferred to exist; however, the significance of the deposit is undetermined.

MRZ-4 Areas where there is not enough information available to determine the presence or absence of mineral deposits.

In 2012, the California Geological Survey (CGS) published an updated map of aggregate resource sectors within the County and that covered the project site. Portions of project parcels 025-302-012, 024-311-020, and 025-311-029 (to the south, southwest, and southeast of the alignment) are identified as being located within Sectors A-2d and A-2e. According to the published map, these are sectors designated by the state mining and geology board (1988) as containing regionally significant PCC-grade aggregate resources (CGS, 2012).

While these areas are identified, the proposed project would not result in a loss for potential productivity. The area within APN 025-302-012 is presently used for agricultural production, the area within APN 025-311-020 is outside the project footprint, and the area within APN 025-311—029 is outside any area currently used for extraction and would not affect any structures used for processing. As discussed above, the proposed project would not remove any area from potential mineral production and would not inhibit the continued use of the adjacent area for mineral production. Thus, impacts in this regard would be less than significant and mitigation is not required.

Cumulative Impacts

The proposed project would not, make a substantial contribution to the loss of a mineral resource. The proposed project would not preclude any area from use as mineral extraction and it is not feasible to use the project site for mineral resources. Thus, the proposed project would not in conjunction with any other past present or reasonably foreseeable project result in a cumulative significant impact. As a result, no cumulative impacts related to mineral resources would occur and mitigation is not required.

NOISE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
13. NOISE. Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			**X**	
b) Generation of excessive groundborne vibration or groundborne noise levels?			**X**	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			**X**	

REGULATORY SETTING

State

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of "normally acceptable", "conditionally acceptable", "normally unacceptable", and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 CNEL and "conditionally acceptable" up to 70 CNEL. Multiple-family residential uses are "normally acceptable" up to 65 CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code

The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as

residential buildings, schools, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings, the acceptable interior noise limit for new construction is 45 dBA CNEL.

Local

City of Tracy General Plan

TheTracy General Plan identifies goals and policies in the Noise Element. The Noise Element identifies and appraises noise generation in the community in order to minimize problems from intrusive sound and to ensure that development does not expose people to unacceptable noise levels. Relevant policies are listed below:

Objective N-1.2: Control sources of excessive noise.

P1: The City's Noise Ordinance, as revised from time to time, shall prohibit the generation of excessive noise.

P2: Mitigation measures shall be required for new development projects that exceed the following criteria:

- Cause the L_{dn} at noise-sensitive uses to increase by 3 dB or more and exceed the "normally acceptable" level.
- Cause the L_{dn} at noise-sensitive uses to increase 5 dB or more and remain "normally acceptable.

Cause new noise levels to exceed the City of Tracy Noise Ordinance limits.

P3: Pavement surfaces that reduce noise from roadways should be considered as paving or repavement opportunities arise.

P4: All construction in the vicinity of noise sensitive land uses, such as residences, hospitals, or convalescent homes, shall be limited to daylight hours or 7:00 AM to 7:00 PM. In addition, the following construction noise control measures shall be included as requirements at construction sites to minimize construction noise impacts:

- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.
- Locate stationary noise-generating equipment as far as possible from sensitive receptors when sensitive receptors adjoin or are near a construction area.

Utilize "quiet" air compressors and other stationary noise sources where technology exists.

Objective N-1.3: Consider noise issues in the Development Review process.

P1: Development projects shall be evaluated for potential noise impacts and conflicts as part of the Development Review process.

P2: Significant noise impacts shall be mitigated as a condition of project approval.

P3: New development projects shall have an acoustical specialist prepare a noise analysis with recommendations for design mitigation if a noise-producing project is proposed near existing or planned noise-sensitive uses.

P5: Site design techniques shall be considered as the primary means to minimize noise impacts as long as they do not conflict with the goals of the Community Character Element. Techniques include:

- Designing landscaped building setbacks to serve as a buffer between the noise source and receptor.
- Placing noise-tolerant land uses, such as parking lots, maintenance facilities, and utility areas between the noise source, such as highways and railroad tracks, and receptor.
- Orienting buildings to shield noise sensitive outdoor spaces from a noise source.
- Locating bedrooms or balconies on the sides of buildings facing away from noise sources.

Utilizing noise barriers (e.g., fences, walls, or landscaped berms) to reduce adverse noise levels in noise-sensitive outdoor activity areas.

City of Tracy Municipal Code

In addition to the standards set forth within the General Plan, Title 4.12, Article 9, Noise Control Ordinance, the City's Municipal Code provides the following General Sound Level Limits (Section 4.12.750):

- Residential Districts have a noise limit of 55 dBA
- Commercial Districts have a noise limit of 65 dBA
- Industrial Districts have a noise limit of 75 dBA
- Agricultural Districts have a noise limit of 75 dBA
- Aggregate Mineral Overlay Zones have a noise limit of 75 dBA

The City's Municipal Code, Title 4.12, Article 9, Noise Control Ordinance, provides the following construction and operational noise standards (Section 4.12.820):

Construction Noise Prohibition

The operation between the hours of 10:00 PM and 7:00 AM of any pneumatic or air hammer, pile driver, steam shovel, derrick, steam, or electric hoist, parking lot cleaning equipment, or other appliance, the use of which is attended by loud or unusual noise.

Business and Residential Relationships

Delivery vehicles shall have their engines turned off when stationary during the regular business hours (6:00 AM to 11:00 PM).

It is unlawful for stores to be loading, unloading, opening or other handling of boxes, crates, containers, building materials, garbage cans, other similar objects and trash compactor operations between the hours of 10:00 PM and 7:00 AM in an area between a business and residential in such a manner to cause a noise disturbance across a residential property line or at any time to violate the general sound level limits.

Store deliveries by motorized refrigeration systems shall not be left running between the hours of 10:00 PM and 7:00 AM within seventy-five feet of a residential zone, residential use, or sleeping quarters.

Note that the noise ordinance requirements cannot be applied to mobile noise sources, such as heavy trucks, when traveling on public roadways. Federal and State laws preempt control of mobile noise sources on public roads and airports.

EXISTING CONDITIONS

Existing Noise Sources

The City of Tracy is impacted by various noise sources. Mobile sources of noise, especially cars and trucks, are the most common and significant sources of noise in the City. Other sources of noise are the various land uses (i.e., residential, commercial, institutional, and recreational and parks activities) throughout the City that generate stationary-source noise.

Existing Stationary Noise

The primary sources of stationary noise in the project vicinity are those associated with the operations of industrial uses to the east, agricultural operations to the west, and nearby residential uses to the northeast and west of the project site. The noise associated with these sources may represent a single-event noise occurrence, short-term noise, or long-term/continuous noise.

Sensitive Receptors

Noise exposure standards and guidelines for various types of land uses reflect the varying noise sensitivities associated with each of these uses. Residences, hospitals, schools, guest lodging, libraries, and churches are treated as the most sensitive to noise intrusion and therefore have more stringent noise exposure targets than do other uses, such as manufacturing or agricultural uses that are not subject to impacts such as sleep disturbance. Adjacent land uses consist of industrial and agricultural operations with single-family residential uses located to the west and northeast. As shown in *Table 4-7: Sensitive Receptors,* sensitive receptors near the project site include multi- and single-family residences. These distances are from the project site to the sensitive receptor property line.

Table 4-7: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Single-family residential	50 feet east
Multi-family residential	330 feet northeast
Single-family residential	725 feet east
Single-family residential	1,075 feet northwest

ENVIRONMENTAL IMPACTS

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant Impact. Construction activities have the potential to create temporary, or periodic increases in ambient noise levels in the project vicinity above levels existing without the project. During the construction of the project, noise from construction activities would add to the noise environment in the project vicinity. The roadway construction would include the use of heavy equipment that can generate noise. Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction site. This noise increase would be of short duration and would likely occur primarily during daytime hours.

Noise sensitive receptors near the construction site would, at time, experience noise levels from construction activities; however, construction-related noise generally would occur during daytime hours only. The project site and vicinity were assumed for urban development as part of the City's General Plan and evaluated in the General Plan EIR. Build-out of the City's General Plan land use map, including the proposed roadway widening, will inherently result in construction and construction-related noise levels. Adherence to the City General Plan and City Municipal Code (Title 4.12, Article 9, Noise Control Ordinance), would minimize any impacts from noise during construction to the extent practicable. Because of the nature, time, and duration of construction activities near sensitive receptors noise impacts from construction activities would cease upon project completion. Therefore, implementation of the proposed project would have a less than significant impact relative to this topic.

Project construction would occur approximately 50 feet from the nearest sensitive receptor to the east along Corral Hollow Road. However, construction activities would occur throughout the project site and would not be concentrated at a single point near sensitive receptors. Noise levels typically attenuate (or drop off) at a rate of 6 dB per doubling of distance from point sources, such as industrial machinery. Noise generated by construction equipment can reach high levels. Typical noise levels associated with individual construction equipment are listed in *Table 4-8: Typical Construction Noise Levels.*

Table 4-8: Typical Construction Noise Levels

Equipment	Maximum Noise Level (dBA) from Source 50 feet (reference level)
Air Compressor	80
Backhoe	80
Compactor	82
Concrete Mixer	85
Concrete Pump	82
Concrete Vibrator	76
Crane, Mobile	83
Dozer	85
Generator[1]	56
Grader	85
Impact Wrench	85
Jack Hammer	88
Loader	80
Paver	85
Pneumatic Tool	85
Pump	77
Roller	85
Saw	76
Scarifier	83
Scraper	85
Shovel	82
Truck	84

1. Generator would include CAT XQ60 Rental Generator Set.
Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

Objective N-1.2, Policy P4 of the City's General Plan limits construction activities in the vicinity of noise sensitive land uses, such as residences, to 7:00 AM to 7:00 PM. The City's Municipal Code does not establish quantitative construction noise standards. Instead, the Municipal Code establishes limited hours of construction activities. As a result, this analysis conservatively uses the Federal Transit Authority's (FTA) threshold of 80 dBA (8-hour Leq) for residential uses to evaluate construction noise impacts. All motorized equipment used in such activity shall be equipped with functioning mufflers as mandated by the State.

Noise impacts for mobile construction equipment are typically assessed as emanating from the center of the equipment activity or construction site. Due to the nature of the project site and limitations on how many pieces of equipment can operate within the same area, maximum construction noise has been calculated for the loudest piece of equipment at the center of the construction area located nearest to sensitive receptors (approximately 65 feet and 330). The Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) was used to calculate noise levels during construction activities; refer to Appendix E: Noise Data. RCNM is a computer program used to assess construction noise impacts and allows for user-defined

construction equipment and user-defined noise limit criteria. Noise levels were calculated for each construction phase and are based on the equipment used, distance to the nearest property/receptor, and acoustical use factor for equipment.

The noise levels calculated in *Table 4-9: Project Construction Noise Levels*, show estimated exterior construction noise at the closest receptors to east and northeast of the project site. Based on calculations using the RCNM model, construction noise levels would range from approximately 77.7 dBA L_{eq} and 78.7 dBA L_{eq} and the single family residence located along Corral Hollow Road (located 65 feet from the centerline of Corral Hollow Road) and 63.6 dBA L_{eq} to 64.6 dBA L_{eq} at the multi-family residences to the northeast (located approximately 330 feet from the project site); see *Table 4-9*. The construction noise levels would not exceed the applicable FTA construction thresholds. Construction equipment would operate throughout the project site and the associated noise levels would not occur at a fixed location for extended periods of time. Although sensitive uses may be exposed to elevated noise levels during project construction, these noise levels would be acoustically dispersed throughout the project site and not concentrated in one area near sensitive uses. the impact from construction noise would be less than significant level.

Table 4-9: Project Construction Noise Levels

Construction Phase	Receptor Distance	Receptor Direction	Receptor Use	Modeled Exterior Noise Level (dBA L_{eq}) [2]	Noise Threshold (dBA L_{eq}) [3]	Exceeded?
Grubbing/Land Clearing	65	East	Single Family Residential	77.7	80	No
	330	Northeast	Multi-Family Residential	63.6		No
Grading/Excavation	65	East	Single Family Residential	78.7		No
	330	Northeast	Multi-Family Residential	64.6		No
Drainage/Utilities	65	East	Single Family Residential	78.7		No
	330	Northeast	Multi-Family Residential	64.6		No
Paving	65	East	Single Family Residential	77.7		No
	330	Northeast	Multi-Family Residential	63.6		No

Notes:
1. Distance is from the nearest receptors to the nearest construction activity area on the project site.
2. Modeled noise levels assume the operation of the loudest piece of equipment at the center of the construction area located nearest to sensitive receptors.
3. Federal Transit Authority's threshold of 80 dBA (8-hour Leq) for residential uses.

Source: Federal Highway Administration, *Roadway Construction Noise Model,* 2006. Refer to Appendix E: Noise Data for noise modeling results.

Although project construction would occur during normal daytime hours and would not exceed FTA thresholds, construction activities could result in a noticeable increase in ambient noise levels in the area. Therefore, prior to the issuance of any grading permits, the project applicant shall submit and implement a Construction Noise Management Plan that specifies hours of construction, noise and vibration minimization measures, posting and notification of construction schedules, equipment to be used, and designation of a noise disturbance coordinator. The noise disturbance coordinator shall respond to neighborhood complaints and shall be in place prior to the start of construction and implemented during construction to reduce noise impacts on neighboring residents and other uses. The noise logistic plan shall be submitted to the Community Development Department Director or Director's designee of the Director of the Community Development Department prior to the issuance of any grading permits. The Construction Noise Management Plan would help to reduce noise levels associated with the construction of the proposed project. Thus, the proposed project would have a less than significant impact in this regard.

Construction Noise Management Plan

Noise reduction measures may include, but are not limited to, the following:

a) Equipment and trucks used for project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds) wherever feasible.

b) Except as provided herein, impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used. This muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used, if such jackets are commercially available. this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures.

c) Temporary power poles shall be used instead of generators where feasible.

d) Stationary noise sources shall be located as far from adjacent properties as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the City of provide equivalent noise reduction.

e) The noisiest phases of construction shall be limited to less than 10 days at a time. Exceptions may be allowed if the City determines an extension is necessary and all available noise reduction controls are implemented.

f) Delivery of materials shall observe the hours of operation described above.

g) Truck traffic should avoid residential areas to the extent possible.

Construction Traffic Noise

Construction is estimated to be approximately three months. Construction noise may be generated by large trucks moving materials to and from the project site. Large trucks would be necessary to

deliver building materials as well as remove dump materials. The project would export a total of approximately 8,985 cubic yards (cy) and import a total of 217 cy of soil during grading. Based on the Road Construction Emissions Mode (RCEM) default assumptions for this project, the project would generate the highest number of daily trips during the grading phase. The model estimates that the project would generate up to 30 worker roundtrips, 47 daily hauling roundtrips, and five water truck roundtrips per day during grading.

According to Objective N-1.2, Policy P2 of the City's General Plan, mitigation would be required for new development that would cause a permanent noise increase of 3 dBA Ldn or more and exceed the "normally acceptable" level or cause a noise increase of 5 dBA Ldn or more and remain "normally acceptable". For reference, a 3 dBA Ldn noise increase would be expected if the project would double existing traffic volumes along a roadway and a 5 dBA Ldn noise increase would be expected if the project would triple existing traffic volumes along a roadway. Corral Hollow Road has approximately 633 PM peak hour trips.[2] A maximum of 82 peak hour project construction trips (assuming that all workers, haul trucks, and water trucks would travel from the site during the PM peak hour) would not double or triple the existing traffic volume. Therefore, construction related traffic noise would not be noticeable and would not create a significant noise impact.

Operations

The project consists of transportation improvements within Corral Hollo Road, Linne Road, within the intersection of the two roadways, and within portions of adjacent parcels. Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes is known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed project would widen Corral Hollow Road to match the width of this and other improvements to the south of the project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane). Project implementation is intended to support projected growth in the vicinity and would not directly result in increased traffic noise. Therefore, increase in operational noise is not anticipated.

b) Generation of excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact. Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise, vibration consists of an amplitude and frequency. A person's perception to the vibration will depend on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system which is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocity (PPV) in inches per second

[2] City of Tracy, *Tracy Hills Specific Plan Recirculated Draft Subsequent EIR,* Table 4.13-8, October 2015

(in/sec). Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of peak particle velocities.

Human and structural response to different vibration levels is influenced by several factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. FTA data indicates that the threshold for damage to structures ranges from 0.2 to 0.6 in/sec PPV. One-half this minimum threshold or 0.1 in/sec PPV is considered a safe criterion that would protect against architectural or structural damage. The general threshold at which human annoyance could occur is noted as 0.1 in/sec PPV.

Construction

Increases in groundborne vibration levels attributable to the project would be primarily associated with construction-related activities. Construction on the project site would have the potential to result in varying degrees of temporary groundborne vibration, depending on the specific construction equipment used and the operations involved. Ground vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The effect on buildings located in the vicinity of the construction site often varies depending on soil type, ground strata, and construction characteristics of the receiver building(s). The results from vibration can range from no perceptible effects at the lowest vibration levels, to low rumbling sounds and perceptible vibration at moderate levels, to slight damage at the highest levels. Groundborne vibrations from construction activities rarely reach levels that damage structures.

The types of construction vibration impacts include human annoyance and building damage. Human annoyance occurs when construction vibration rises significantly above the threshold of human perception for extended periods of time. Building damage can be cosmetic or structural. Ordinary buildings that are not particularly fragile would not experience cosmetic damage (e.g., plaster cracks) at distances beyond 30 feet. This distance can vary substantially depending on soil composition and underground geological layer between vibration source and receiver.

The FTA has published standard vibration velocities for construction equipment operations. In general, depending on the building category of the nearest buildings adjacent to the potential pile driving area, the potential construction vibration damage criteria vary. For example, for a building constructed with reinforced concrete with no plaster, the FTA guidelines show that a vibration level of up to 0.50 inch per second (in/sec) peak particle velocity (PPV) is considered safe and would not result in any construction vibration damage.

Table 4-10: Typical Construction Equipment Vibration Levels, lists vibration levels at 25 feet, 50 feet, and 125 feet for typical construction equipment. Groundborne vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. As indicated in *Table 4-10*, based on FTA data, vibration velocities from typical heavy construction equipment operations that would be used during project construction range from 0.003 to 0.089 in/sec PPV at 25 feet from the source of activity.

Table 4-10: Typical Construction Equipment Vibration Levels

Equipment	Peak Particle Velocity At 25 feet (in/sec)	Peak Particle Velocity At 50 feet (in/sec)	Peak Particle Velocity At 125v feet (in/sec)
Vibratory Roller	0.210	0.074	0.0113
Large Bulldozer	0.089	0.032	0.0048
Loaded Trucks	0.089	0.032	0.0048
Small Bulldozer/Tractors	0.003	0.001	0.0002

1. Calculated using the following formula: PPVequip = PPVref x (25/D)1.5, where: PPVequip = the peak particle velocity in in/sec of the equipment adjusted for the distance; PPVref = the reference vibration level in in/sec from Table 7-4 of the Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, 2018; D = the distance from the equipment to the receiver.

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018.

As shown in *Table 4-10*, the highest vibration levels are achieved with the vibratory roller operations. This construction activity is expected to take place during grading and paving. The nearest structure is approximately 50 feet from the active construction zone. As indicated in *Table 4-10*, construction vibration levels at the nearest sensitive receptors (50 feet away) would not exceed the FTA's 0.20 PPV threshold for construction vibration damage or the 0.1 in/sec PPV threshold of human annoyance. In addition, construction activities would occur throughout the project site and would not be concentrated at the point closest to the nearest structure. Therefore, vibration impacts associated with the project would be less than significant.

Operations

The project would not generate groundborne vibration that could be felt at surrounding uses. Project operations would not involve railroads or substantial heavy truck operations, and therefore would not result in vibration impacts at surrounding uses. As a result, impacts from vibration associated with project operation would be less than significant.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less Than Significant Impact. The proposed project is located within the Airport Land Use area for the Tracy Municipal Airport, which is located east of the project site. Tracy Municipal Airport is owned and operated by the City of Tracy. The airport is a general aviation airport and provides a range of aviation services including general aviation and jet fuel sales, and hangar and tie down rentals. The project site is located in the 60 dB event contour for this airport.

The project does not include any permanent residents or other uses that would place workers or other people in long-term exposure or in proximity to noise from the airport. However, in the short-term, workers within the project area could be subject to noise levels up to 60 dB as a result of the Tracy Municipal Airport operations. These noise levels would be short-term and infrequent.

Additionally, the construction workers are subject to loud noises as a result of construction equipment operation. The infrequent, short-term noise exposure along the project alignment would not result in health or safety concerns for the workers in the area. Additionally, construction workers typically use safety equipment, such as ear plugs or earmuffs, which can reduce noise level during particularly noisy activities. Implementation of the proposed project would have a less than significant impact and mitigation is not required.

Cumulative Impacts

Cumulative Construction Noise

The project's construction activities would not result in a substantial temporary increase in ambient noise levels. The City limits construction to the hours of 7:00 a.m. to 7:00 p.m. on Monday through Friday. The project would contribute to other proximate construction noise impacts if construction activities were conducted concurrently. However, based on the noise analysis above, the project's construction-related noise impacts would be less than significant following compliance with local regulations and the Construction Noise Management Plan outlined above.

Construction activities at other planned and approved projects would be required to take place during daytime hours, and the City and project applicants would be required to evaluate construction noise impacts and implement mitigation, if necessary, to minimize noise impacts. Each project would be required to comply with the applicable City of Tracy Municipal Code limitations on allowable hours of construction. Therefore, project construction would not contribute to cumulative impacts and impacts in this regard are not cumulatively considerable.

Cumulative Operational Noise

Cumulative noise impacts describe how much noise levels are projected to increase over existing conditions with the development of the project and other foreseeable projects. Cumulative noise impacts would occur primarily as a result of increased traffic on local roadways due to the buildout to of the area. As discussed above, the project would not directly result in an increase in operations at the intersection of Corral Hollow Road and Linne Road. Therefore, no impact would occur.

POPULATION AND HOUSING

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
14. POPULATION AND HOUSING. Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			**X**	
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?			**X**	

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The project site is currently designated for industrial, commercial, and urban reserve. The proposed project does not include any residential uses that would directly generate new residents and increase the population within the City or County. The proposed project also would not result in intensification of land uses, or the addition of structures or uses that would differ from the current General Plan, or that would require new employees or uses that would increase demand for permanent employees.

Projects that would not directly increase population still have the potential to result in indirect population growth through the creation of jobs or the extension of infrastructure into areas that were not previously served. While, the proposed project would increase the width and capacity of segments of Corral Hollow Road and Linne Road, install new signalization, and improve LOS, the improvements to the roadway system are a planned effort and coordinate with past and ongoing improvement plans to Corral Hollow Road to the north and south of the project. It should be noted all these improvements are along existing roadway segments. Lastly, in part, those improvements, as well as those of the proposed project would accommodate the future buildout under the General Plan. Thus, in this regard, the project would not result in growth inducement.

Although it is possible that demand for construction workers could induce a few workers to move into the City or Regional area for work opportunities, this is anticipated to be a very small number compared to the workers needed to build the project. In addition, because the size of the project is relatively small, the total demand for construction workers would be corresponding small. It is anticipated that with the recent and continuing growth of the City and County, there are adequate numbers of people already residing in the area and with existing construction companies to fill all

employment needs. Therefore, impacts from the proposed project to unplanned population growth are less than significant.

Lastly, any individual future projects would have to be consistent with the General Plan and are subject to environmental review under CEQA. No substantial population increases would result from implementation of the proposed project. Therefore, implementation of the proposed project would have a less than

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Less than significant Impact. The proposed project would result in the acquisition of portions of adjacent parcels for a total of approximately 1.59 total acres. The majority of these areas, however, consist of existing roadway shoulder, railroad right-of-way, orchard, and undeveloped property. Approximately 0.53 acres would be acquired from APN 025-311-020, which contains an existing business. The area acquired from this parcel, however, would be from an undeveloped portion of the parcel and no structures or habitable buildings would be removed or require removal. Thus, the proposed project would not displace any existing housing units or structures and would not result in a displacement. No replacement housing would be needed. Impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

Overall, the proposed project would serve the exiting demand from the existing population within the local vicinity and regional travelers. The proposed project is be consistent with the planned land uses in the City's General Plan and the population and employment projections for the City, County, and the region as a whole. While the proposed project result in minor takings, the project would not, in conjunction with other past, present, or reasonably foreseeable projects, make a substantial impact to cumulative growth. The proposed project and other projects that have been, will be developed, or that are in the planning process are considered in the context of their consistency with local and regional planning efforts to include population growth and the need for housing. Therefore, the proposed project would not cause a cumulatively considerable impact on population and housing and no mitigation is required.

PUBLIC SERVICES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
15. PUBLIC SERVICES. Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
i) Fire protection?			**X**	
ii) Police protection?			**X**	
iii) Schools?			**X**	
iv) Parks?			**X**	
v) Other public facilities?			**X**	

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

i) Fire protection?

Less Than Significant Impact. The project site is currently under the jurisdiction of the San Joaquin County Fire Authority (SSJCFA, 2022). The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in an intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for emergency services. Accordingly, the proposed project would not require the expansion or development of a new fire station or any other fire

infrastructure, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

ii) Police protection?

Less Than Significant Impact. The project site is currently under the jurisdiction of the Tracy Police Department (TPD) and the San Joaquin Sheriff's Office (SJSO). The proposed project would not include additional residential units, or people to the City of Tracy. The proposed project includes the widening of Corral Hollow Road (within SJSO jurisdiction) and Linne Road and signalization of the intersection (within TPD jurisdiction). These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for law enforcement services. Accordingly, the proposed project would not require the expansion or development of a new police station, or any other police related infrastructure, the construction of which could result in impacts to the environment. In addition, should emergency services be required, because the City and County boundaries would not change, the service areas for each department would not change. Thus, Impacts would be less than significant, and no mitigation is required.

iii) Schools?

Less Than Significant Impact. The San Joaquin County of Education is a regional agency that provides education al leadership, resources, and customized services to assist school districts that includes the Tracy Unified School District (SJCOE, 2022a and b). Residents within the vicinity of the project are served by the Tracy Unified School District for public education needs. The proposed project would not include additional residential units, or people to the City of Tracy. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for school services. Accordingly, the proposed project would not require the expansion or development of a school or any other education related infrastructure, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

iv) Parks?

Less Than Significant Impact. The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of parks within the City or region. Accordingly, the proposed project would not require the expansion or development of any park, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

v) Other public facilities?

Less Than Significant Impact. Other public facilities in the area such as health care, production, commercial, retail, residential, etc. would not be adversely impacted. The proposed project would not include additional residential units, or people to the City of Tracy or within the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of other public services. Accordingly, the proposed project would not require the expansion or development of any of these resources, the construction of which could result in impacts to the environment. Thus, Impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

The proposed project would not include additional residential units, or people to the City of Tracy or the County. The proposed project includes the widening of Corral Hollow Road and Linne Road and signalization of the intersection. These improvements would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan or that would increase the number of residents that could increase demand for or use of public services within the City or region. The proposed project also would not combine with past, present, and reasonably foreseeable project such that a cumulative impact would result. Lastly, the proposed project would not result in substantial incremental effects to public services or facilities that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable projects. The project alone would not result in cumulatively considerable impacts to public services or facilities.

RECREATION

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
16. RECREATION.				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			**X**	
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?			**X**	

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less Than Significant Impact. The proposed project does not include any residential units or any other type of use that would increase the population, or park and recreation facility demand in the area, or include any other type of use that would directly increase the use of park and recreation facilities. The proposed project would not result in an intensification of land uses, or the addition of structures or uses that would differ from the current General Plan. Therefore, the proposed project would not result in a substantial increase on the demand for existing recreational resources such that substantial physical deterioration would occur or be accelerated. Thus, impacts of the proposed project would be less than significant in this regard and mitigation is not required.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Less Than Significant Impact. The proposed project consists of a roadway improvements projects but does not include any new recreational resources that could result in impacts on the environment beyond those already evaluated as part of this document. Thus, the proposed project would not have a significant adverse physical effect on the environment, impacts would be less than significant, and no mitigation is required.

Cumulative Impacts

Development of the proposed project would not create a significant cumulative increase of recreational facilities. In addition, the proposed project would not combine with other past, present, or reasonably foreseeable projects and result in significant cumulative impacts. The

project would not impact any existing recreation facilities and would not create a substantial population increase to impact existing recreational facilities. Therefore, no cumulative impacts on recreational facilities would occur.

TRANSPORTATION

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
17. TRANSPORTATION. Would the project:				
a) Conflict with an program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?			**X**	
b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?			**X**	
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			**X**	
d) Result in inadequate emergency access?			**X**	

a) Conflict with an program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less than Significant Impact. No new structures, uses, or visitor serving areas are included in the project. The proposed project does not result in an overall increase in vehicle trips but would serve existing deficiencies and tie into existing two-lane improvements to the north and south within Corral Hollow Road. The proposed project does not include any trip generating uses that would result in additional vehicle miles travelled or a reduction of LOS. The proposed project also would include sidewalks and bicycle facilities along the widened roadway that would provide residents and users in the area with access to these alternative transportation uses. Impacts in this regard would be less than significant, and no mitigation is required.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Less Than Significant Impact. CEQA Guidelines Section 15064.3 states that "vehicle miles traveled" (VMT) is the preferred metric evaluating transportation impacts, rather than LOS. VMT measures the total miles traveled by vehicles generated by a project. While LOS focuses on motor vehicle traffic, VMT accounts for the total environmental impact of a project on transportation, including use of travel modes such as buses or bicycles. Section 15064.3(b) sets forth the criteria for analyzing transportation impacts using the preferred VMT metric.

As discussed in a) above, the proposed project does not include any new uses or structures, or visitor serving areas and it would not result in an overall increase in vehicle trips or vehicle miles

travelled. The proposed project would serve existing uses that are anticipated to be developed in accordance with adopted planning documents and improve the level of service and functionality of the intersection and roadways. Thus, impacts related to increased VMT are less than significant.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. No site circulation or access issues have been identified that would cause a traffic safety problem/hazard or any unusual traffic congestion or delay that could impede emergency vehicles or emergency access. The project does not include any design features or incompatible used that pose a significant safety risk. The project would create no adverse impacts to emergency vehicle access or circulation. Therefore, project implementation would have a less than significant impact in this regard.

d) Result in inadequate emergency access?

Less Than Significant Impact. Emergency vehicle access would be maintained at all times throughout construction activities, in accordance with the City and County routine/standard construction specifications as applicable. No site circulation or access issues have been identified that would cause a traffic safety problem/hazard or any unusual traffic congestion or delay that would impede emergency access to any local roadways or surrounding properties or result in a safety risk. All driveways and roads would be constructed to accommodate all emergency vehicles and personnel. Therefore, implementation of the proposed project would have a less than significant impact in this regard.

Cumulative Impacts

The proposed project would improve LOS at the intersection with the widening of the roadways to tie into existing and on-going roadway improvements and construction of signals and increase the functionality of travel in the area. The proposed project is intended to serve existing and planned uses and does not include any uses, combined with other past, present, and reasonably foreseeable projects that would contribute to an increase in VMT. Although other future uses in the vicinity including new residential uses may generate new vehicle trips, the proposed project would not generate new trips and would only serve to accommodate travel between existing and planned uses. Therefore, the proposed project would not result in incremental effects to transportation that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Potential impacts are not cumulatively considerable and less than significant.

TRIBAL CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
18. TRIBAL CULTURAL RESOURCES. Would the project:				
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?		**X**		
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?		**X**		

a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

And,

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Potentially Significant Unless Mitigation Incorporated. An *Archaeological Survey Report* for project site was conducted by Horizon Water and Environment in July 2022. As previously mentioned, there were no historical resources found to be impacted by the proposed project, this is substantiated through a CHRIS records search, background research, review of historical topographic and aerial imagery, a Sacred Land File Search, and a pedestrian survey. However, the absence of substantial surface prehistoric or historic-period archeological remains within the project vicinity and the existing level of disturbance does not preclude the possibility of subsurface resources.

The City has notified California Native American tribes who have formally requested notification on CEQA projects under Assembly Bill 52. This included notification to eight tribes (Ione Band of Miwok Indians, The Confederated Villages of Lisjan, Muwekma Ohlone Indian Tribe of the SF Bay Area, North Valley Yokuts Tribe, Tule River Indian Tribe, Buena Vista Rancheria of Me-Wuk Indians, Wilton Rancheria, and Wuksache Indian Tribe/Eshom Valley Band).

These notification letters were distributed to identified Native American Tribes on August 1, 2022. These letters are on file at the City of Tracy Planning Department. As of 30 days after sending the letters and publication of this document. No tribes have requested formal consultation.

Examples of significant archaeological discoveries that may meet the tribal cultural resource definition would include villages and cemeteries. Due to the possible presence of unknown tribal cultural resources within the project site, construction related impacts on tribal cultural resources would be potentially significant. Though the circumstances would present a low possibility, the following mitigation measure (MM) would reduce impacts in the unanticipated discovery of cultural resources during construction. With the implementation of **MM CUL-1**, **MM CUL-2**, and **MM CUL-3** above in Section 4.5 Cultural Resources, impacts would be less than significant.

Cumulative Impacts

The combination of the proposed project as well as past, present, and reasonably foreseeable projects in the local area would be required to comply with all applicable State, federal, and County and local regulations concerning preservation, salvage, or handling of cultural and paleontological resources, including compliance with required mitigation. Similar to the proposed project, these projects also would be required to implement and conform to mitigation measures, which would be likely to reduce impacts to less than significant. Although in the process of roadway improvements, some known or unknown resources may be lost, it is not anticipated that these impacts would be cumulatively considerable. In addition, implementation of Mitigation Measures **MM CUL-1, MM CUL-2,** and **MM CUL-3** would reduce project-specific impacts to a less than significant level. Therefore, the project's contribution to cumulative impacts would be less than significant.

UTILITIES AND SERVICE SYSTEMS

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
19. UTILITIES AND SERVICE SYSTEMS. Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?			**X**	
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?			**X**	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?			**X**	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			**X**	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?			**X**	

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. The proposed project will not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. The proposed project would not include additional residential units, or people to the City of Tracy or within the County such that new or expanded utilities would be required. No additional demand for water, wastewater, storm water drainage, electric power, natural gas, or telecommunications facilities will be created by the project. The project includes the widening of Corral Hollow Road and Linne Road, signalization of the intersection, installation of new lights, and curb and gutter and sidewalk

improvements. These improvements are part of a planned effort to coordinate improvements to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA. Accordingly, the proposed project would not require the expansion or development of new utilities that, the construction of which could result in impacts to the environment. Impacts would be less than significant, and no mitigation is required.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. The proposed project will not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. The proposed project would not include additional residential units, or people to the City of Tracy or within the County such that new demand for water would occur, or such that new or expanded water infrastructure would be required. The project includes the widening of Corral Hollow Road and Linne Road, signalization of the intersection, installation of new lights, and curb and gutter and sidewalk improvements. These improvements are part of a planned effort to coordinate improvements to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA.

It should be noted that limited volumes of water would be necessary during construction related activities for watering of soils for dust control, washing vehicles, mixing materials, etc. This use, however, would be temporary in nature for construction related activities only, and would not be in substantial volumes. Thus, the proposed project would not result is substantial use of water from the existing supplies during normal, dry, or multiple dry years. The project water demand would be served through existing entitlements and resources. Impacts would be less than significant in this regard and mitigation is not required.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments

Less Than Significant Impact. As previously stated, the proposed project would not result in intensification of land use, or the addition of structures or uses that would differ from the current General Plan. No additional demand for wastewater treatment, or other water treatment facilities would be needed or are proposed as part of the project. The proposed project could relocate some utilities within the project site to facilitate the transportation improvements such as electrical connections and horizontal movement of other lines (e.g., water, gas, etc.). The proposed project, however; would not increase the service capacity of these lines and the relocation would not be made with the intent to serve undeveloped areas. The movement of lines would, however, be done to accommodate the future buildout of the General Plan. In addition, any individual future projects would have to be consistent with the General Plan and would be subject to environmental review under CEQA. Thus, the proposed project would not result in any new wastewater generators, nor does it propose any improvements that would result in increased treatment demand by

wastewater treatment provider that new capacity would be needed. Impacts would be less than significant, and mitigation is not required.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? And,

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. As previously stated, the proposed project will not result in an intensification of land use, or the addition of structures or uses that would result in an increased demand for services. The proposed project is consistent with the General Plan and would be used to serve the existing and planned land uses in the vicinity. The proposed project would not result in a long-term use that would generate substantial volumes of waste that would require disposal. Construction of the proposed project, however, would result the generation of minor volumes of solid waste. Because the project consists of roadway improvements and does not include any structures that require building materials, waste generation would be minimal. Waste that is generated during construction could be self-hauled, or contract services with Tracy Delta Solid Waste Management could be made. Waste would be recycled as possible at the Lovelace Materials Recovery Facility and Transfer Station with non-recyclable materials anticipated to be taken to the Foothill Sanitary Landfill, which is projected to be open until 2082 and the project would not substantially reduce capacity.

Thus, the proposed project would not interfere with regulations related to solid waste or generate waste in excess of the capacity of local infrastructure. The proposed project would have a less than significant impact in this regard.

Cumulative Impacts

Utilities are generally provided or delivered on a local level but often originate from sources outside local areas as most areas are served through the regional distribution system. As discussed above, the proposed project does not include any uses that would require long term utilities services within the exception of a minimal increase in electricity demand for new traffic signals and lights. Taken in conjunction with past, present, and reasonably foreseeable projects the overall increased demand for utilities would be incrementally small and the project would not make a substantial cumulative contribution. Therefore, implementation of the project would not result in a cumulatively considerable contribution to impacts on water supply and wastewater, stormwater, or solid waste generation.

WILDFIRE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
20. WILDFIRE. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?			**X**	
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?			**X**	
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?			**X**	
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?			**X**	

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The proposed project includes roadway improvements and would not substantially impair an adopted emergency response plan or emergency evacuation plan. The proposed project could, during construction, require short term lane closures, and intermittent reductions in travel volumes and speeds due to the presence of equipment and personnel, but these interruptions would be temporary. After construction, the project would increase continuity between existing segments of both Corral Hollow Road and Linne Road and improve the LOS within the roadways and intersections. This would improve the viability of the roadways for emergency access as well as evacuations. The proposed improvements would intermittently require roadway maintenance; but such work is inherent to roadway operations and would not substantially hinder emergency access or evacuation. Therefore, impacts from project implementation would be considered less than significant in this regard.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Less Than Significant Impact. The risk of wildfire is related to a variety of parameters, including fuel loading (vegetation), fire weather (winds, temperatures, humidity levels and fuel moisture contents) and topography (degree of slope). Steep slopes contribute to fire hazard by intensifying the effects of wind and making fire suppression difficult. Fuels such as grass are highly flammable because they have a high surface area to mass ratio and require less heat to reach the ignition point. The County has areas with an abundance of flashy fuels (i.e., grassland) in the County. The project would not result in development of structures or housing which would subject residents, visitors, or workers to long-term wildfire danger. Therefore, impacts from project implementation would be considered less than significant in this regard.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Less Than Significant Impact. The proposed project includes standard infrastructure improvements associated a roadway widening. The proposed project is not located in a very high or high wildfire hazard severity zone and is predominantly surrounded by industrial and agricultural uses that are not prone to wildfire. The proposed project does not include the need for construction of use of roadways, fuel breaks, or water sources that could exacerbate wildfire hazards. The project would include relocation of some utilities, but the relocation would not be in any area prone to wildfire, and it would not result in temporary or long-term impacts in this regard. Impacts would be less than significant, and no mitigation is required.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Less Than Significant Impact. The proposed project site is not in a VHFHSZ nor located near steep slopes or hillsides. The proposed project would implement efficient landscape maintenance practices and design measures to decrease the release of stormwater running off the site; therefore, the proposed project site would not expose people to downstream flooding or landslides as a result of runoff. Impacts would be less than significant.

Cumulative Impacts

The proposed project area is not subject to natural wildfire areas. Consequently, implementation of the proposed project would not create a significant cumulative impact that would exacerbate wildfires. Impacts would be less than significant.

MANDATORY FINDINGS OF SIGNIFICANCE

ENVIRONMENTAL IMPACTS Impact	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
21. MANDATORY FINDINGS OF SIGNIFICANCE. Does the project:				
a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?			**X**	
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?			**X**	
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?			**X**	

a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant Impact. The analysis in this Initial Study includes an evaluation of the project impacts associated with aesthetics, agricultural and forest resources, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation/traffic, tribal cultural resources, utilities and service systems, and wildfire. The analysis covers a broad spectrum of topics relative to the potential for the proposed Project to have environmental impacts. This includes the potential for the proposed project to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to

drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

The proposed project would occur within an existing roadway and other adjacent highly disturbed areas that do not contain resources that would be commonly used by sensitive species or contain sensitive biological resources. In addition, due to past development efforts the potential for cultural resources or tribal cultural resources to be present or located during construction activities is considered to be low. Thus, for the reasons presented throughout this document, the proposed project would not substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

Nonetheless, the proposed project would be approved with adoption of mitigation to reduce potential impacts to nesting birds and includes mitigation for inadvertent discovery of cultural resources. Thus, it was found that the proposed project would have either no impact, a less than significant impact, or a less than significant impact with the implementation of mitigation measures.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less Than Significant Impact. The analysis in this Initial Study includes an evaluation of the project impacts associated with aesthetics, agricultural and forest resources, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation/traffic, tribal cultural resources, utilities and service systems, and wildfire. The analysis covers a broad spectrum of topics relative to the potential for the proposed project to have environmental impacts. It was found that the proposed project would have either no impact, a less than significant impact, or a less than significant impact with the implementation of mitigation measures. These mitigation measures would also function to reduce the project's contribution to cumulative impacts.

The proposed project would not increase the population or the use of public services and systems and would not conflict with any applicable plans for the area. The proposed project would increase the capacity of the roadway system, which could allow for future development near the project area. However, all uses accommodated by the widening and LOS improvements, would be in accordance with the General Plan and land use map. Furthermore, any future projects would be subject to environmental review under CEQA. There are no significant cumulative or cumulatively considerable effects that are identified associated with the proposed project after the implementation of all mitigation measures. With the implementation of all mitigation measures

proposed in this Initial Study, the proposed project would have a less than significant impact relative to this topic.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less Than Significant Impact. Potential adverse project effects on human beings were discussed in Section, *Air Quality*; Section, *Geology and Soils (seismic hazards)*; Section, *Hazards and Hazardous Materials*; Section, *Hydrology and Water Quality (flooding);* Section, *Transportation (traffic hazards)*; and Section, *Wildfire*. No potential adverse effects on human beings were identified. Potential adverse effects that were identified would be reduced to levels considered less than significant through compliance with applicable laws, regulations, and City ordinances and standards, along with mitigation measures where necessary.

Data Entry Worksheet

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a
yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	Corral Hollow and Linne Road	
Construction Start Year	2024	Enter a Year between 2014 and 2040 (inclusive)
Project Type	2	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	3.00	months
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	1	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	0.50	miles
Total Project Area	1.00	acre
Maximum Area Disturbed/Day	1.00	acre
Water Trucks Used?	1	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/googlemaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing			
	Grading/Excavation	20.00	21.70	898.50
	Drainage/Utilities/Sub-Grade			
	Paving			
Asphalt	Grubbing/Land Clearing			
	Grading/Excavation			
	Drainage/Utilities/Sub-Grade			
	Paving			

Mitigation Options

On-road Fleet Emissions Mitigation		Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation		Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to confirm compliance with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation). Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that can be modified by the user, although those modifications are optional.

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Construction Periods	User Override of Construction Months	Program Calculated Months	User Override of Phase Starting Date	Program Default Phase Starting Date
Grubbing/Land Clearing	0.50	0.30	6/1/2024	1/1/2024
Grading/Excavation	0.50	1.20	6/15/2024	1/17/2024
Drainage/Utilities/Sub-Grade	0.67	1.05	7/1/2024	2/2/2024
Paving	1.00	0.45	8/1/2024	2/23/2024
Totals (Months)		3		

Please note: You have entered a different number of months than the project length shown in cell D16.
Note: Soil Hauling emission default values can be overridden in cells D61 through D64, and F61 through F64.

Soil Hauling Emissions User Input	User Override of Miles/Round Trip	Program Estimate of Miles/Round Trip	User Override of Truck Round Trips/Day	Default Values Round Trips/Day	Calculated Daily VMT
Miles/round trip: Grubbing/Land Clearing		30.00		0	0.00
Miles/round trip: Grading/Excavation		30.00		47	1410.00
Miles/round trip: Drainage/Utilities/Sub-Grade		30.00		0	0.00
Miles/round trip: Paving		30.00		0	0.00

Emission Rates	ROG	CO	NOx	PM10	PM2.5	SOx	CO2	CH4	N2O	CO2e

Paving	0	0	0	0	1,200	40

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

1 Introduction and Project Description

1.1 Introduction

The Roadway Improvements for Traffic Signal Installation at the Corral Hollow Road and Linne Road Intersection Project (Project or proposed Project) is located in the City of Tracy (City) within San Joaquin County, California (see Figure 1). More specifically, the project site is located within the existing road grades at the intersection of Corral Hollow Road and Linne Road. Both roads will be widened at the intersection to provide both through lanes and right-turn lane pockets, which will require the acquisition of new right of way (ROW), as well as utility relocation. The Union Pacific Railroad (UPRR) runs perpendicular (east-west) to W. Linne Road directly north of the intersection, where it is crossed by Corral Hollow Road.

1.2 Purpose and Need

The proposed road widening and signalization along Corral Hollow Road would maintain road width consistency along Corral Hollow Road and increase the intersection level of service (LOS) at the intersection with W. Linne Road. Corral Hollow Road is currently being widened north of the intersection with W. Linne Road and private development will fund the widening east and south of the intersection. The Project would widen Corral Hollow Road to match the width of these other projects. The intersection of Corral Hollow Road currently operates at a deficient LOS. The improvements, including widening, addition of a dedicated turn lane, and addition of signalization, would improve the LOS. Intersection improvements would improve mobility, alleviate traffic congestion, and improve traffic efficiency along Corral Hollow Road.

1.3 Project Description

The proposed Project would make transportation improvements to Corral Hollow Road and Linne Road, within the intersection of the two roadways and within portions of adjacent parcels. Improvements would include widening Corral Hollow Road and Linne Road, and the addition of signals within the intersection.

Corral Hollow Road would be widened to two (2) travel lanes in each direction. These project improvements would start immediately north of the UPRR ROW and extend southerly to approximately 500 feet south of the intersection with W. Linne Road. Other improvements proposed along Corral Hollow Road would include the construction of a center median, curbs, and sidewalks. New sidewalk and curb and gutter would be installed on the westerly side of the roadway and at the two corners of the intersections. Standard sidewalks and curb ramps would be Americans with Disabilities Act (ADA) compliant. In addition, the driveways to the adjacent properties would be improved with new concrete driveways. A total of four new driveways would be installed.

A new retention basin (approximately 0.35 acres/15,400 square feet) would be installed adjacent to the southwest corner of the intersection and would require the removal of approximately 40 orchard trees. Other standard improvements would include the installation of new signage, roadway striping, and crosswalks. All roadway improvements would conform to Caltrans and City standards as applicable.

Minor improvements to W. Linne Road would be made, primarily in the westbound lanes. The road would be widened to enable paving and striping of a new right turn only lane. The existing left lane

would remain and be used as a left only lane to southbound Corral Hollow Road. The proposed Project would also install new traffic signals at the intersection of Corral Hollow Road and W. Linne Road as well as streetlights and a pre-signal north of the UPRR crossing for southbound traffic along Corral Hollow Road. Signals would be connected to existing infrastructure on the north side of Corral Hollow Road. Signal timing between the proposed traffic signal, the pre-signal, and raising and lowering of guard arms, would be created in coordination with UPRR.

Some ROW acquisitions would be required. In addition to the listed 40 orchard trees above, approximately 151 other trees would be removed, for new ROW and a temporary construction easement. The project would also require removal of some existing hardscape and fencing, grinding and matching with existing pavement grades, and utility relocation.

It should be noted that Corral Hollow Road is currently being widened north of the intersection and private development is anticipated to fund additional widening efforts to both roadways as development progresses and demand becomes known. Ongoing widening of Corral Hollow Road is occurring to the north, and the proposed Project would widen Corral Hollow Road to match the width of this and other improvements to the south of the Project site. This is intended to help ensure smooth traffic flow and avoid constriction that would occur under the existing alignment (from two lanes to a single lane).

1.3.1 Stormwater

The proposed Project would include new stormwater facilities and would utilize an approximate 0.35-acre retention basin to contain stormwater flows, promote water infiltration, and reduce potential for increased downstream stormwater flows.

1.3.2 Utilities

The proposed Project would tie into existing utilities for electrification of the new signals, streetlights, and other roadway and railroad crossings, as needed. As applicable, it would tie into existing water, stormwater, sewer, gas, electrical, and telecommunications utilities. Substantial alterations are not needed because the Project does not include new land uses. The proposed Project would realign the existing above ground utility lines and poles adjacent to the new roadways.

1.4 Construction

Some demolition, excavation, and grading would be required for this Project. Equipment that may be used to accomplish Project work is listed in Table 1 below. Some excavation to a maximum depth of 14 feet for the installation of traffic signal poles, six feet for the drainage feature, and four feet for road widening would be required only where these Project elements are proposed.

Table 1. Equipment

Bobcat/skid steer loader	Gradall (multi-purpose excavator)
Compactor (Ground)	Jackhammer
Concrete Mixer Truck	Pavement Scarifier/Roller
Concrete Saw	Pneumatic Tools
Crane or bucket truck	Truck (Dump/Flat Bed)
Dozer/Grader/Excavator/Scraper	

1.5 Biological Study Area

The Biological Study Area (BSA) includes the Corral Hollow Road and W. Linne Road intersection and adjacent areas (Figure 1). **Appendix A** provides representative site photographs.

2 Study Methods

2.1 Regulatory Requirements

2.1.1 Federal Endangered Species Act

The federal Endangered Species Act (ESA) is administered by the U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS). Overall, NMFS is responsible for protection of ESA-listed marine species and anadromous fish species, while other listed species fall under USFWS jurisdiction.

2.1.2 California Endangered Species Act

The California Endangered Species Act (CESA) incorporates provisions that permit impacts to species listed in California as rare, threatened, or endangered. CESA declares that it is the policy of the State that State agencies should not approve projects that would jeopardize the continued existence of a species listed under CESA as endangered or threatened or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if reasonable and prudent alternatives are available consistent with conserving the species or its habitat that would prevent jeopardy (California Fish and Game Code [CFGC] Section 2053).

Section 2080 of the CFGC prohibits the take of any species that is state-listed as endangered or threatened, or designated as a candidate for such listing. "Take" is defined by Section 86 of the California Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" an individual of a listed species. Under the CESA, the CDFW may issue an incidental take permit authorizing the take of listed and candidate species that is incidental to an otherwise lawful activity, subject to specified conditions.

2.1.3 Clean Water Act (CWA)

The federal Clean Water Act (CWA) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters. CWA requirements pertaining to the proposed project are described below.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S., must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Boards (RWQCB) administer the certification program in California.

Section 404 establishes United States Army Corps of Engineers (USACE) jurisdiction over fill materials in essentially all water bodies, including wetlands. All federal agencies are to avoid impacts to wetlands whenever there is a practicable alternative. Section 404 established a permit program administered by USACE regulating the discharge of dredged or fill material into waters of the U.S. (including wetlands).

Section 404 guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

2.1.4 Porter-Cologne Water Quality Control Act

The 1969 Porter–Cologne Water Quality Control Act (known as the Porter–Cologne Act) dovetails with the CWA. It established the State Water Resources Control Board (SWRCB) and divided the state into nine regions, each overseen by its own RWQCB. The SWRCB is the primary state agency responsible for protecting the quality of the state's surface water and groundwater supplies; however, much of the SWRCB's daily implementation authority is delegated to the nine RWQCBs, which are responsible for implementing CWA Sections 402 and 303[d]. In general, the SWRCB manages water rights and regulates statewide water quality, whereas RWQCBs focus on water quality within their respective regions.

The Porter–Cologne Act requires that the RWQCB develop water quality control plans (also known as Basin Plans) that designate beneficial uses of California's major surface-water bodies and groundwater basins and establish specific narrative and numerical water quality objectives for those waters. Beneficial uses represent the services and qualities of a waterbody (i.e., the reasons that the waterbody is considered valuable). Water quality objectives reflect the standards necessary to protect and support those beneficial uses. Basin Plan standards are primarily implemented by regulating waste discharges so that water quality objectives are met. Under the Porter–Cologne Act, Basin Plans must be updated every three years. Project activities that result in point-source discharges into state-regulated waters are subject to the RWQCB's Waste Discharge Requirements Program in order to ensure compliance with Basin Plan standards and water quality objectives.

2.1.5 Migratory Bird Treaty Act

The Migratory Bird Treaty with Canada, Mexico and Japan makes it unlawful to take, possess, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter, any migratory bird, or the parts, nests, or eggs of such a bird except under the terms of a valid Federal permit. The federal Migratory Bird Treaty Act (MBTA) applies to the removal of nests occupied by migratory birds during the breeding season.

2.1.6 California Fish and Game Code

Section 3503

Section 3503 of the CFGC prohibit the take, possession, or needlessly destruction of a nest or eggs of any bird, except as otherwise provided by CFGC or any regulation made pursuant thereto.

2.1.7 Executive Order 13112 – Invasive Species

On February 3, 1999, President William J. Clinton signed Executive Order (EO) 13112 requiring federal agencies to combat the introduction or spread of invasive species in the United States. The order defines invasive species as "any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem whose introduction does or is likely to cause economic or environmental harm or harm to human health." Federal Highway Administration guidance issued August 10, 1999 directs the use of the State's invasive species list, maintained by the California Invasive Species Council (ISCC) to define the invasive plants that must be considered as part of the National Environmental Policy Act (NEPA) analysis for a proposed project.

2.2 Studies Required

2.3 Literature and Database Review

Biological resources and potential impacts were identified through a literature and database review. A literature review was used to develop a list of special-status plant and wildlife species and natural communities. For purposes of this evaluation, special-status species are those that are listed under or included in:

- the federal ESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species;
- the California Endangered Species Act (CESA) as threatened, endangered, rare, or a candidate species;
- the California Native Plant Society (CNPS)'s California Rare Plant Rank (CRPR) designations as rare or endangered with ranks of 1A, 1B, 2A, 2B, or 3;
- Designated by CDFW as a California species of special concern; or
- Listed in the California Fish and Game (F&G) Code as a fully protected species (birds at Section 3511, mammals at Section 4700, reptiles and amphibians at Section 5050, and fish at Section 5515).

The following data sources on special-status species were queried:

- USFWS list of federally endangered and threatened species that may occur in the proposed Project, and/or may be affected by the proposed Project (USFWS 2022a);
- USFWS's Critical Habitat Portal (USFWS 2022b);
- National Wetland Inventory (NWI) results (USFWS 2022c);
- California Department of Fish and Wildlife's California Natural Diversity Database (CNDDB) queries for the nine U.S. Geological Survey (USGS) 7.5-minute Quadrangles surrounding and encompassing the BSA (Tracy, Veralis, Lathrop, Union Island, Clifton Court Forebay, Midway, Cedar Mountain, Lone Tree Creek, and Solyo);
- CNPS Inventory of Rare and Endangered Plants of California queries for the for the nine USGS 7.5-minute Quadrangles surrounding and encompassing the BSA; and
- eBird records for the study area (Cornell Lab of Ornithology 2022).

Results from the database queries are provided in **Appendix B**. A NMFS species list is not required, as the Proposed Project is outside of NMFS jurisdiction. Based on the results of the searches, preliminary field surveys were then conducted to evaluate the listed special-status plants, wildlife, and fish species and their potential to occur within the BSA, included in **Appendix C.**

Maps of existing biological resources, including an aerial photographic overview of the BSA (Figure 1), CNDDB special-status species occurrence records within five miles of the BSA (Figures 2 and 3), and critical habitat (Figure 4), were created based on the literature review. No critical habitat is present within the BSA.

2.4 Field Reviews

2.4.1 Survey Methods and Dates

Previous Surveys

Three surveys were conducted in 2018 for the Corral Hollow Road Widening Phase 2 Linne Road to I-580 Project. This road widening project overlaps the Proposed Project along Corral Hollow Road, and within the orchard. These surveys were conducted by Steve McMurtry of De Novo Planning Group to evaluate biological conditions within the project area (De Novo Planning Group 2020).

Current Survey

Horizon biologists Robin Hunter and Erica Caddell conducted a reconnaissance survey of the BSA on May 2, 2022. The survey was conducted on-foot in all accessible areas within BSA. Natural and anthropogenic features, land cover types, and the presence of common and special-status species were visually surveyed. Visual aids, such as binoculars, were used to better assess survey areas and wildlife species when appropriate.

2.5 Agency Coordination and Professional Contacts

No coordination with regulatory agencies has occurred.

3 Biological Study Area Description

3.1 Environmental Setting

3.1.1 Physical Conditions

Topography

Topography in the vicinity of the BSA is largely flat. Elevations in the BSA range from approximately 160-170 feet above mean sea level, sloping up towards the southwest (USGS 1981).

Climate

The study area has a Mediterranean climate characterized by cool, wet winters and hot, dry summers. Average temperatures range from a low of 36 degrees Fahrenheit (°F) in January to a high of 85°F in July (Natural Resources Conservation Service [NRCS] 2022a). Average annual precipitation is approximately 9.9 inches, with the majority of precipitation occurring from October through April (NRCS 2022a).

Soils

The Project area is underlain by Zacharias clay loam, 0 to 2 percent slopes (NRCS 2022b). This soil is not classified as a hydric soil (NRCS 2022c).

3.1.2 Land Use

The land uses in the vicinity of the BSA consist of a mix of agriculture, industrial, residential, and infrastructure (canals and airport). Residential uses are dominant to the north as new development is expanding southerly from the main City center. Residential development is located to the northwest of the Project site and additional homes are under construction. Further to the northwest the primary land use is agricultural production. To the southeast, south, and southwest, the Project is surrounded by a mix of land uses. This includes industrial uses for concrete production, the Tracy Municipal Airport, American Legion Park, the Tracy Water Treatment Plan, the northerly reach of the Delta Mendota Canal, and agricultural land.

Adjacent land uses to the north of Linne Road include highly disturbed roadway shoulder and the UPRR. This area is nearly devoid of vegetation and does not contain any structures. To the south of Linne Road is an industrial site with numerous buildings used for sand and gravel operations and manufacturing concrete products. To the southeast of the corner of Linne Road and Corral Hollow Road is a lot that is partially developed with three small single-story structures. The westerly side of this lot is adjacent to the eastern alignment of Corral Hollow Road. The northerly portion of the lot contains an undeveloped but disturbed area with an existing billboard. The southerly half of this parcel contains three structures. To the west of Corral Hollow Road is agricultural land that is cultivated with an orchard. There are above ground power lines strung on wooden power poles along both the southerly sides of Linne Road and the easterly side of Corral Hollow Road.

3.2 Biological Resources

3.2.1 Land Cover Types

This section describes habitats and land cover present within the BSA. The reconnaissance survey identified four land cover types in the study area: developed, landscaped, orchard, and ruderal. Vegetation within the study area was surveyed on foot. Botanical nomenclature follows the second edition of the Jepson Manual (Baldwin et al. 2012). The characteristics of each land cover type are described below.

Developed

Developed land cover includes W. Linne Road, Corral Hollow Road, adjacent driveways, and the UPRR tracks. Vegetation in these areas, if present at all, is usually sparse and dominated by opportunistic weedy herbaceous species. Wildlife species typically associated with developed areas include striped skunk (*Mephitis mephitis*), raccoon (*Procyon lotor*), and Virginia opossum (*Didelphis virginiana*).

Landscaped

Landscaped areas of the BSA are characterized by ornamental vegetation. Due to its close proximity to the more expansive developed areas, wildlife associated with landscaped vegetation is the same as associated developed cover.

Orchard

An almond (*Prunus dulcis*) orchard is present in the western portion of the BSA. The understory vegetation that would provide food and cover for wildlife is sparse in this orchard, limiting the abundance and diversity of wildlife species that may be found there. Species such as the side-blotched lizard (*Uta stansburiana*), pocket gopher (*Thomomys bottae*), squirrel (*Citellus* spp.), and western brush rabbit (*Sylvilagus bachmani*) can occur in this habitat type.

Ruderal

Ruderal vegetation is characterized by non-native forbs and grasses in a disturbed habitat typically along the edges of development or areas with frequent anthropogenic impacts (e.g., mowing/discing). This vegetation type is present to the north of the orchard and in the disced field located to the southeast of the intersection.

3.2.2 Aquatic resources

No aquatic resources were present within the BSA. A rock-lined constructed detention basin is located just outside the BA, to the northwest of the intersection.

3.2.3 Invasive species

Table 2 identifies the invasive species observed in BSA during the field survey. The species listed in the table were observed at numerous locations in the BSA and are considered invasive based on the ISCC invasive plant species list.

Table 1: Invasive Species Observed in the BSA

Scientific Name	Common Name	Cal-IPC Ranking*
Bromus madritensis ssp. rubens	red brome	High
Carduus pycnocephalus	Italian thistle	Moderate
Centaurea solstitialis	yellow star thistle	High
Convolvulus arvensis	field bindweed	Not listed
Festuca perennis	Italian ryegrass	Moderate
Hordeum murinum	Foxtail barley	Moderate
Lactuca serriola	Prickly lettuce	Not listed
Malva parviflora	Cheeseweed mallow	Not listed

* California Invasive Plant Council (Cal-IPC) ranking for ecological impacts.

3.2.4 Habitat Connectivity

Habitat within and in the vicinity of the BSA is largely isolated, and connectivity is substantially restricted due to the surrounding land uses. The BSA is largely developed, landscaped, disturbed, or in orchard cultivation. The overall degree of noise and human presence and activity within and adjacent to the BSA further reduces the quality of habitat within the BSA.

3.3 Special-Status Species

3.3.1 Plants

Special-status plants known to occur in the vicinity of the BSA were evaluated for their potential to occur (**Appendix C**). No special-status plants are anticipated to occur in the BSA.

3.3.2 Wildlife

Special-status wildlife known to occur in the vicinity of the BSA were evaluated for their potential to occur are described in detail in Appendix C and summarized below. Additional detail is provided in Chapter 4.

San Joaquin kit fox (*Vulpes macrotis mutica*) is known to occur in the vicinity of the BSA (Figure 3). Burrowing owl (*Athene cunicularia*) and Swainson's hawk (*Buteo swainsoni*) are known to occur at several locations within 5 miles of the Proposed Project (Figure 3). A Swainson's hawk was also observed perching on a power pole in the BSA during the May reconnaissance survey.

Several species of special-status bats may forage over the BSA, including pallid bat (*Antrozous pallidus*), Townsend's big-eared bat (*Corynorhinus townsendii*), and western mastiff bat (*Eumops perotis californicus*).

3.3.3 Critical Habitat

No Critical Habitat is designated within the study area (USFWS 2022b).

3.4 Regional Species and Habitats and Natural Communities of Concern

This section describes special-status species, their habitats, their potential to occur within the BSA. Table 3 includes the species that have potential to occur in the BSA. Complete lists of all special-status plant, wildlife, and fish species considered are included in Appendix C.

Table 2: Species with Potential to Occur.

Scientific Name **Common Name**	**Status (Federal / State)**	**General Habitat Description**	**Potential to Occur at the Project Site** **Effect Finding for Federally Listed Species**
Vulpes macrotis mutica San Joaquin kit fox	FE/ST	Annual grasslands or grassy open stages with scattered shrubby vegetation. Needs loose-textured sandy soils for burrowing and suitable prey base.	**May occur.** No dens were observed during the May 2022 reconnaissance survey; however, this species is known from the vicinity of the BSA and could travel through the BSA. **May affect, not likely to adversely affect.**
Buteo swainsoni Swainson's Hawk	-/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	**Present.** Potentially suitable foraging habitat is present in the vicinity of the BSA. This species is not anticipated to nest within the BSA, but may nest in the vicinity. No suitable nest trees are present within the BSA. One individual observed perching in the BSA during the May 2022 reconnaissance survey.
Athene cunicularia burrowing owl	-/SCC	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	**May occur.** Potentially suitable foraging habitat is present and there are known CNDDB occurrences within 5 miles of the BSA (CDFW 2022). The BSA is not anticipated to provide suitable nesting habitat due to the lack of burrows observed during May 2022 reconnaissance survey.

Scientific Name **Common Name**	**Status (Federal / State)**	**General Habitat Description**	**Potential to Occur at the Project Site** **Effect Finding for Federally Listed Species**
Antrozous pallidus pallid bat	-/SSC	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**Possible.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Corynorhinus townsendii Townsend's big-eared bat	-/SCC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. This species generally roosts in caves, abandoned mines, and occasionally buildings and is extremely sensitive to human disturbance (Pierson and Rainey 1998).	**May occur.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Eumops perotis californicus western mastiff bat	-/SSC	Many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	**May occur.** Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.

Status Legend

Federal:

FE = federally listed as endangered

- = no listing status

State

ST = state threatened

SSC = species of special concern

4 Results: Biological Resources, Discussion of Impacts and Mitigation

4.1 Habitats and Natural Communities of Special Concern

Natural communities of special concern include those that are regulated by federal, state, or local jurisdictions, have limited distributions, and/or support populations of special-status plants or wildlife. Federal and state agencies also consider wetlands and waters of the United States as features of special concern. No natural communities of special concern, wetlands, or waters of the United States were identified within the BSA. Therefore, no impacts would occur.

4.2 Critical Habitat

USFWS and NMFS designated critical habitat to protect areas that are essential to the survival of federally listed species of plants and wildlife. No critical habitat is present within the BSA. Therefore, no impacts would occur.

4.3 Special Status Plant Species

Many special-status plant species were identified by the CNDDB, CNPS, and USFWS databases as having potential to occur in the region (see Appendix B). However, no special-status plant species are expected to occur in the BSA due to the lack of suitable habitat. No special-status plant species were observed during the biological reconnaissance-level survey, or in previous surveys conducted within the BSA. Since special-status plant species are not expected to occur within the BSA, the Project would not impact any special-status plants.

4.4 Special Status Animal Species

The CNDDB and USFWS databases identified special-status wildlife species that have potential to occur in the region (see Appendix B). Based on the observations made during the biological reconnaissance-level surveys, all but eight species were determined to have no potential or were not expected to occur within the BSA due to the lack of suitable habitat. The special-status species with potential to occur include San Joaquin kit fox, Swainson's hawk, burrowing owl, pallid bat, Townsend's big-eared bat, and western mastiff bat.

4.4.1 San Joaquin Kit Fox

Survey Results

The BSA is mainly comprised of roadways and orchard. These areas may be utilized by San Joaquin kit fox for dispersal and occasional foraging, but are generally not suitable for extended periods of occupation (USFWS 2010). No dens were observed during reconnaissance surveys. Due to the very limited extent of suitable habitat, this species is considered unlikely to occur in the BSA.

Project Impacts

Although it is unlikely that San Joaquin kit fox would occur within the BSA, construction activities could create temporary barriers to movement and dispersal of this species.

Avoidance and Minimization Efforts

Potential impacts to San Joaquin kit fox would be minimized by implementing Avoidance and Minimization Measure (AMM)-1, which requires pre-construction surveys for San Joaquin kit fox dens and additional avoidance or minimization measures.

AMM-1: Avoid and Minimize Impacts to San Joaquin kit fox:

- A qualified biologist will conduct preconstruction surveys no less than 14 days and no more than 30 days before the commencement of activities to identify potential dens more than 5 inches in diameter within 200 feet of ground disturbing activities. The City will implement USFWS' (2011) Standardized Recommendations for Protection of San Joaquin Kit Fox Prior to or During Ground Disturbance. The City will notify USFWS in writing of the results of the preconstruction survey within 30 days after these activities are completed.
- If potential dens are located within the proposed work area and cannot be avoided during construction activities, a USFWS-approved biologist will determine if the dens are occupied. If occupied dens are present within the proposed work, their disturbance will be avoided. Exclusion zones will be implemented following the most current USFWS procedures (currently USFWS 2011). The City will notify USFWS immediately if a natal or pupping den is found in the survey area, and will present the results of pre-activity den searches within 5 days after these activities are completed and before the start of construction activities in the area.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to San Joaquin kit fox would be avoided through the implementation of AMM-1.

4.4.2 Swainson's Hawk

Survey Results

A Swainson's hawk was observed perching on a power pole in the BSA during the May reconnaissance survey. No suitable nesting habitat for this species is present within the BSA. Marginally suitable nesting habitat is present in the tree located to the northeast of the intersection of Corral Hollow Road and the Delta Mendota Canal, to the southeast of the BSA. Trees that provide marginally suitable nesting habitat area also present in the residential development to the north of W. Linne Road. This species may also forage within or adjacent to the BSA.

Project Impacts

Although no nesting habitat is present within the BSA, this species could nest in the marginally suitable habitat that is present within ½ mile of the BSA. Construction could disturb nesting Swainson's hawk through generation of noise or visual distraction. No suitable nesting habitat would be removed by the Project.

The Project would not remove foraging habitat for Swainson's hawk, but would result in temporary noise and visual disturbance during construction that could cause these species to avoid foraging within or adjacent to the BSA. Due to the large amount of foraging habitat available in the region, this would not be a significant impact.

Avoidance and Minimization Efforts

Implementation of AMM-2 would minimize impacts on Swainson's hawk.

> **AMM-2: Conduct Swainson's Hawk Surveys**
>
> If construction occurs between February 1 and August 31, the City or its contractor(s) shall require that a qualified biologist conduct surveys no more than 10 days before the start of construction for Swainson's hawk in accordance with the recommended timing and methodology developed by the Swainson's Hawk Technical Advisory Committee (2000 or most recent). Surveys will cover a minimum ½-mile radius around the construction area. If nesting Swainson's hawk are detected, buffers shall be established around active nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active nests will be ½ mile unless a qualified biologist determines, based on a site-specific evaluation, that a smaller buffer is sufficient to avoid impacts on nesting raptors. Factors to be considered when determining buffer size include the presence of natural buffers provided by vegetation or topography, nest height, locations of foraging territory, and baseline levels of noise and human activity. Buffers shall be maintained until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to Swainson's hawk would be avoided through the implementation of AMM-2.

4.4.3 Burrowing Owl

Survey Results

No burrows potentially suitable for burrowing owl were observed during reconnaissance surveys, and no burrowing owls, whitewash, or other evidence of occupation by burrowing owls was observed. Burrowing owl could forage within the vicinity of the BSA. However, this species may disperse and colonize suitable habitat within the BSA.

Project Impacts

If present in the vicinity of the BSA, construction could disturb burrowing owls through noise, visual distraction, or direct impacts to occupied habitat.

Avoidance and Minimization Efforts

Implementation of AMM 3 would minimize the potential for impacts on burrowing owls

> **AMM-3: Nesting Bird Avoidance:**
>
> To the extent feasible, construction activities should be scheduled to avoid the nesting season. If Project activities are scheduled to take place outside the nesting season, impacts to nesting

birds protected under the MBTA and California Fish and Game Code would be avoided. The nesting season for most birds in San Joaquin County extends from February 1 through August 31. If it is not possible to schedule Project activities outside the nesting season, then the following measures will be implemented:

- A qualified biologist will conduct pre-construction surveys for nesting birds. These surveys shall be conducted no more than seven days prior to the initiation of Project activities, including tree and vegetation removal. During these surveys, the biologist shall inspect all trees and other potential nesting habitats (e.g., shrubs, ruderal areas, burrows, and structures) in and immediately adjacent to the construction areas for nests.
- If an active nest is found sufficiently close to work areas to be disturbed by these activities, a non-disturbance buffer zone will be established around the nest at the biologist's discretion and in accordance with regulatory permits and conditions to ensure that no nests of special-status species or species protected by the MBTA and California Fish and Game Code shall be disturbed during Project implementation. Buffers zones will remain until the birds have fledged or the nest is no longer active as determined by a qualified biologist.

Compensatory Mitigation

No compensatory mitigation is necessary because impacts to burrowing owl would be avoided through the implementation of AMM-3.

4.4.4 Special-status Bats

Survey Results

Several species of special-status bats may forage over the BSA, including pallid bat, Townsend's big-eared bat, and western mastiff bat. Suitable roosting habitat for these species is not present within the BSA.

Project Impacts

Construction of the Project is anticipated to have minimal impacts on bat foraging, and no impacts on bat roosting. Therefore, impacts would not be significant and no avoidance or minimization measures or compensatory mitigation would be required.

4.5 Nesting Birds

Migratory birds and their occupied nests, young, and eggs are protected under federal and state laws. The BSA and immediately surrounding area includes a few trees and shrubs that provide suitable nesting habitat for a variety of bird species protected under the CFGC and the MBTA.

4.5.1 Survey Results

Two inactive nest structures were observed in a shrub within the BSA during the May 2022 survey. Trees and shrubs within and adjacent to the BSA provide suitable nesting substrate for bird species protected by MBTA.

4.5.2 Project Impacts

Impacts to active nests belonging to MBTA- and CFGC-protected bird species could occur throughout the BSA and immediately surrounding nesting substrate from construction activities. Indirect effects including project-related noise and vibration generated from nearby construction activities may disrupt nesting activity or nest fitness that could result in nest abandonment, potentially to the point of nestling mortality. Suitable nesting substrate occurs in shrubs and trees in and surrounding the BSA, and MBTA-protected bird species could nest within and adjacent to the BSA. Therefore, active nests of MBTA-protected species could be impacted by the Project.

4.5.3 Compensatory Mitigation

No compensatory mitigation is necessary because impacts to nesting birds would be avoided through the implementation of AMM-3.

4.5.4 Avoidance and Minimization Efforts

Active bird nests protected by CFGC sections 3503 and 3503.5, as well as the MBTA will be avoided through the implementation of AMM-3

5 Summary and Conclusions

5.1 Federal Endangered Species Act Consultation Summary

Horizon biologists obtained a USFWS list of federally listed species potentially occurring in the BSA and vicinity on April 27, 2022, available in **Appendix B**. Additionally, the biologists obtained CNDDB and CNPS lists of special-status species occurrences in the BSA and surrounding vicinity, including federally listed species, prior to biological surveys. No other coordination with USFWS has occurred. This Project is located outside of NMFS jurisdiction; therefore, a NMFS species list is not required and no effects to NMFS species would occur.

Evaluations of federally listed species resulted in one species with a "may affect, but not likely to adversely affect" determination. The Project may affect, but is not likely to adversely affect San Joaquin kit fox. AMMs are proposed that would avoid and minimize effects on San Joaquin kit fox resulting from construction of the Project. No other federally-listed species will be impacted by this Project. Full species tables are provided in **Appendix C**. No coordination with U.S. Fish and Wildlife Service has occurred.

5.2 Essential Fish Habitat Consultation Summary

No Essential Fish Habitat is present within the BSA. Therefore, no impacts would occur.

5.3 California Endangered Species Act Consultation Summary

Swainson's hawk is listed as threatened under CESA, and was observed within the BSA. With implementation of AMMs, the Project would not impact CESA-listed species. Therefore, an Incidental Take Permit is not required. No consultation with CDFW has occurred to date.

5.4 Wetlands and Other Waters Coordination Summary

No wetlands or other waters are present within the BSA; therefore, no coordination is required.

5.5 Other

5.5.1 Migratory Bird Treaty Act

The Migratory Bird Treaty Act protects migratory bird nests from disturbances that leads to nest abandonment and/or loss of nest success. CFGC sections 3503 and 3503.5 also protect active bird nests from being taken, possessed, or needlessly destroyed. Birds have potential to nest within trees and structures within the BSA; however, the implementation of AMM-3 ensures that active nests are avoided by project-related disturbance. Project activities will avoid the nesting season (February 1 to August 31) to the extent feasible. Should Project activities be required to occur during the nesting season, a pre-construction survey will identify active nests and establish no disturbance buffers. Therefore, the Project will have no effect on active bird nests protected by the MBTA or CFGC section 3503 and 3503.5.

Appendix B
USFWS, CNPS, and CNDDB Species Lists

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

San Joaquin County, California

Local office

Sacramento Fish And Wildlife Office

(916) 414-6600

Federal Building

2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern https://www.fws.gov/program/migratory-birds/species
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your

project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Common Yellowthroat *Geothlypis trichas sinuosa* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/2084	Breeds May 20 to Jul 31
Golden Eagle *Aquila chrysaetos* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31
Nuttall's Woodpecker *Picoides nuttallii* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9410	Breeds Apr 1 to Jul 20

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Yellow-billed Magpie Pica nuttalli — Breeds Apr 1 to Jul 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9726

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

NOT FOR CONSULTATION

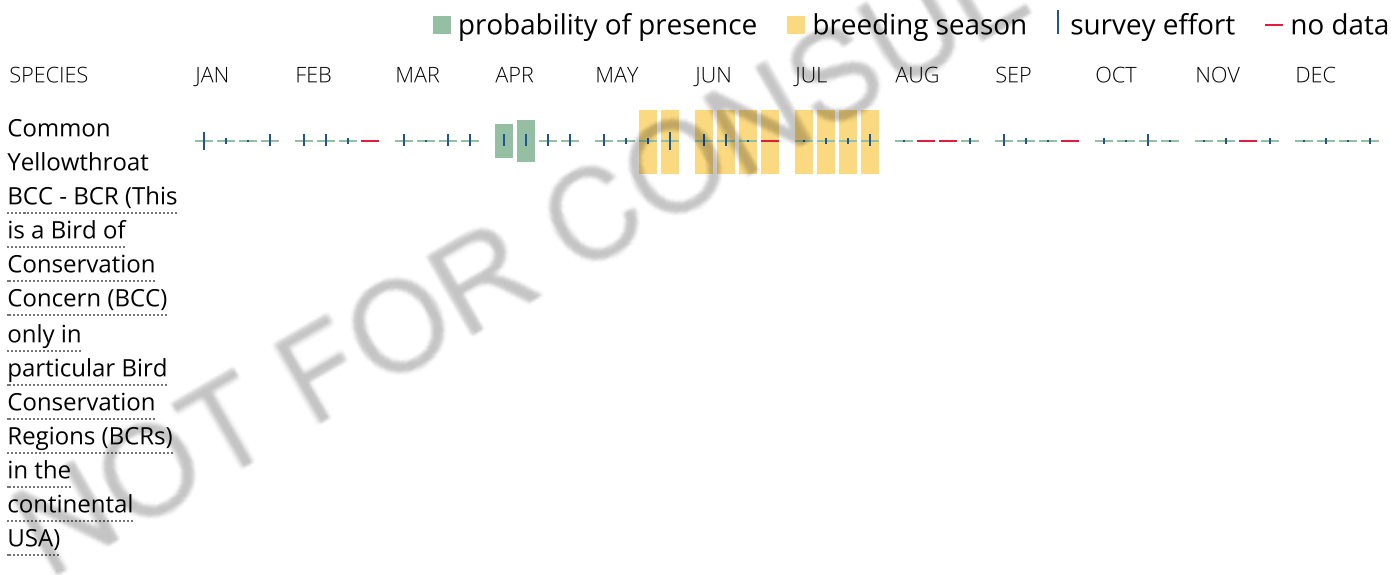
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

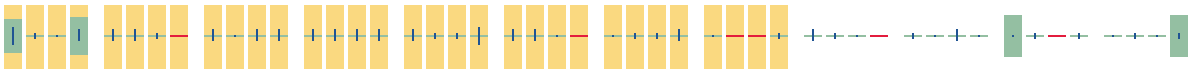
No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

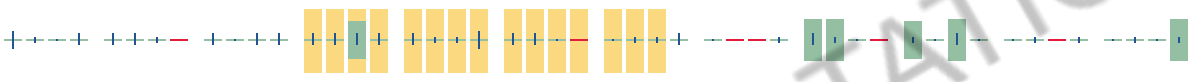


NOT FOR CONSULTATION

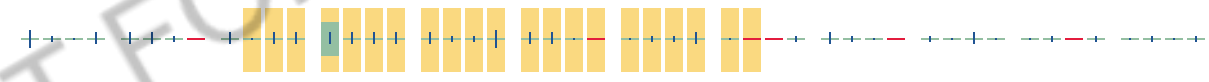
Golden Eagle Non-BCC Vulnerable (This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.)



Nuttall's Woodpecker BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

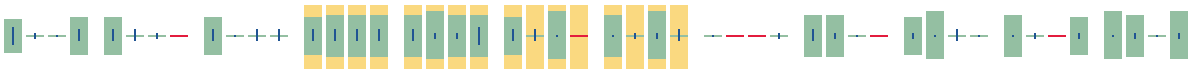


Tricolored Blackbird BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



NOT FOR CONSULTATION

Yellow-billed Magpie BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

NOT FOR CONSULTATION

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

NOT FOR CONSULTATION

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

WETLAND INFORMATION IS NOT AVAILABLE AT THIS TIME

This can happen when the National Wetlands Inventory (NWI) map service is unavailable, or for very large projects that intersect many wetland areas. Try again, or visit the NWI map to view wetlands at this location.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Appendix C
Special-status Species Tables

Appendix C: Special-status Species Tables

Table C-1: Special-status Plants

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Amsinckia grandiflora large-flowered fiddleneck	FE/SE/1B.1	Cismontane woodland, valley and foothill grassland. Annual grassland in various soils. 275-550 meters.	None. Suitable habitat is not present in the BSA
Allium sharsmithiae Sharsmith's onion	-/-/1B.3	Chaparral, Cismontane woodland, ultramafic. Rocky, serpentine slopes. 425-975 meters.	None. Suitable habitat is not present in the BSA
Atriplex cordulata var. cordulata heartscale	-/-/1B.2	Chenopod scrub, valley and foothill grassland, meadows. Alkaline flats and scalds in the Central Valley, sandy soils. 0-560 meters. Blooms April to October.	None. Suitable habitat is not present in the BSA
Astragalus tener var. tener Alkali milk-vetch	-/-/1B.2	Alkali playa, valley and foothill grassland, vernal pools. Low ground, alkali flats, and flooded lands; in annual grassland or in playas or vernal pools. 0-170 meters.	None. Suitable habitat is not present in the BSA
Blepharizonia plumosa big tarplant	-/-/1B.1	Valley and foothill grassland. Dry hills and plains in annual grassland. Clay to clay-loam soils; usually on slopes and often in burned areas. 30-505 meters. Blooms July to October.	Not expected. Marginally suitable habitat is present in the BSA.
Campanula exigua chaparral harebell	-/-/1B.2	Chaparral. Rocky sites, usually on serpentine in chaparral. 90-1375 m.	None. Suitable habitat is not present in the BSA.
Caulanthus lemmonii Lemmon's jewelflower	-/-/1B.2	Pinyon and juniper woodland, valley and foothill grassland. 75-1,585 meters. Blooms February to May.	None. Suitable habitat is not present in the BSA.
Centromadia parryi ssp. Congdonii Congdon's tarplant	-/-/1B.1	Valley & foothill grassland. Alkaline soils, sometimes described as heavy white clay. 0-245 m.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Chlorogalum pomeridianum var. minus dwarf soaproot	-/-/1B.2	Chaparral. Serpentine. 120-1220 m.	None. Suitable habitat is not present in the BSA.
Cirsium crassicaule slough thistle	-/-/1B.1	Chenopod scrub, marshes and swamps, riparian scrub. Sloughs, riverbanks, and marshy areas. 3-95 m.	None. Suitable habitat is not present in the BSA.
Cirsium fontinale var. campylon Mt. Hamilton thistle	-/-/1B.2	Cismontane woodland, chaparral, valley and foothill grassland. In seasonal and perennial drainages on serpentine. 75-890 m.	None. Suitable habitat is not present in the BSA.
Delphinium californicum ssp. Interius Hospital Canyon larkspur	-/-/1B.2	Cismontane woodland, chaparral, coastal scrub. In wet, boggy meadows, openings in chaparral and in canyons. 195-1095 m.	None. Suitable habitat is not present in the BSA.
Delphinium recurvatum Recurved larkspur	-/-/1B.2	Chenopod scrub, valley and foothill grassland, cismontane woodland. On alkaline soils; often in valley saltbush or valley chenopod scrub. 3-790 m.	None. Suitable habitat is not present in the BSA.
Eriastrum tracyi Tracy's eriastrum	-/SR/3.2	Chaparral, cismontane woodland, valley and foothill grassland. Gravelly shale or clay; often in open areas. 315-2400 m.	None. Suitable habitat is not present in the BSA.
Eryngium racemosum Delta button-celery	-/SE/1B.1	Riparian scrub. Seasonally inundated floodplain on clay. 3-75 meters. Blooms June to October.	None. Suitable habitat is not present in the BSA.
Eryngium spinosepalum Spiny-sepaled button-celery	-/-/1B.2	Vernal pools, valley and foothill grassland. Some sites on clay soil of granitic origin; vernal pools, within grassland. 15-1270 m.	None. Suitable habitat is not present in the BSA.
Eschscholzia rhombipetala diamond-petaled California poppy	-/-/1B.1	Valley and foothill grassland. Alkaline, clay slopes and flats. 30-625 meters. Blooms March to April.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Extriplex joaquinana San Joaquin spearscale	-/-/1B.2	Chenopod scrub, alkali meadow, playas, valley and foothill grassland. In seasonal alkali wetlands or alkali sink scrub with Distichlis spicata, Frankenia, etc. 0-800 m.	None. Suitable habitat is not present in the BSA.
Fritillaria falcata Talus fritillary	-/-/1B.2	Chaparral, cismontane woodland, lower montane coniferous forest. Mostly on serpentine talus, but occasionally found on granitics. 425-1435 m.	None. Suitable habitat is not present in the BSA.
Helianthella castanea Diablo helianthella	-/-/1B.2	Broadleafed upland forest, chaparral, cismontane woodland, coastal scrub, riparian woodland, valley and foothill grassland. Usually in chaparral/oak woodland interface in rocky, azonal soils. Often in partial shade. 45-1070 m.	None. Suitable habitat is not present in the BSA.
Hesperolinon breweri Brewer's western flax	-/-/1B.2	Chaparral, cismontane woodland, valley and foothill grassland. Often in rocky serpentine soil in serpentine chaparral and serpentine grassland. 195-910 m.	None. Suitable habitat is not present in the BSA.
Hibiscus lasiocarpos var. occidentalis woolly rose-mallow	-/-/1B.2	Marshes and swamps (freshwater). Moist, freshwater-soaked river banks and low peat islands in sloughs; can also occur on riprap and levees. In California, known from the delta watershed. 0-155 m.	None. Suitable habitat is not present in the BSA.
Hoita strobilina Loma Prieta hoita	-/-/1B.1	Chaparral, cismontane woodland, riparian woodland. Serpentine; mesic sites. 60-975 m.	None. Suitable habitat is not present in the BSA.
Leptosyne hamiltonii Mt. Hamilton coreopsis	-/-/1B.2	Cismontane woodland. On steep shale talus with open southwestern exposure. 535-1280 m.	None. Suitable habitat is not present in the BSA.
Lilaeopsis masonii Mason's lilaeopsis	-/-/1B.1	Marshes and swamps, riparian scrub. Tidal zones, in muddy or silty soil formed through river deposition or river bank erosion. In brackish or freshwater. 0-10 m.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Limosella australis Delta mudwort	-/-/2B.1	Riparian scrub, marshes and swamps. Usually on mud banks of the Delta in marshy or scrubby riparian associations; often with *Lilaeopsis masonii*. 0-5 m.	None. Suitable habitat is not present in the BSA.
Madia radiata showy golden madia	-/-/1B.1	Valley and foothill grassland, cismontane woodland. Mostly on adobe clay in grassland or among shrubs. 75-1220 m.	None. Suitable habitat is not present in the BSA.
Malacothamnus hallii Hall's bush-mallow	-/-/1B.2	Chaparral, coastal scrub. Some populations on serpentine. 10-735 m.	None. Suitable habitat is not present in the BSA.
Micropus amphibolus Mt. Diablo cottonweed	-/-/3.2	Valley and foothill grassland, cismontane woodland, chaparral, broadleafed upland forest. Bare, grassy or rocky slopes. 45-825 m.	None. Suitable habitat is not present in the BSA.
Navarretia nigelliformis ssp. radians shining navarretia	-/-/1B.2	Cismontane woodland, valley and foothill grassland, vernal pools. Apparently in grassland, and not necessarily in vernal pools. 60-975 m.	None. Suitable habitat is not present in the BSA.
Phacelia phacelioides Mt. Diablo phacelia	-/-/1B.2	Chaparral, cismontane woodland. Adjacent to trails, on rock outcrops and talus slopes; sometimes on serpentine. 605-1345 m.	None. Suitable habitat is not present in the BSA.
Puccinellia simplex California alkali grass	-/-/1B.2	Meadows and seeps, chenopod scrub, valley and foothill grasslands, vernal pools. Alkaline, vernally mesic. Sinks, flats, and lake margins. 1-915 meters. Blooms March to May	None. Suitable habitat is not present in the BSA.
Senecio aphanactis Chaparral ragwort	-/-/2B.2	Chaparral, cismontane woodland, coastal scrub. Drying alkaline flats. 20-1020 m.	None. Suitable habitat is not present in the BSA.
Spergularia macrotheca var. longistyla Long-styled sand-spurrey	-/-/1B.2	Marshes and swamps, meadows and seeps. Alkaline. 0-220 m.	None. Suitable habitat is not present in the BSA.

Scientific/Common Name	Status (Federal/ State/CRPR)	Habitat	Potential to Occur in the Project Area
Trichocoronis wrightii var. wrightii Wright's trichocoronis	-/-/2B.1	Marshes and swamps, riparian forest, meadows and seeps, vernal pools. Mud flats of vernal lakes, drying river beds, alkali meadows. 5-435 m.	None. Suitable habitat is not present in the BSA.
Tropidocarpum capparideum Caper-fruited tropidocarpum	-/-/1B.1	Valley and foothill grassland. Alkaline clay. 0-360 m.	None. Suitable habitat is not present in the BSA.

Status Legend

Federal:

FE = federally listed as endangered

FT = federally listed as threatened

- = no listing status

State:

SE = state listed as endangered

SR = state designated as rare

CRPR (California Rare Plant Rank):

1B = Plants Rare, Threatened, or Endangered in California and Elsewhere

2B = Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3 = Plants about which more information is needed, a review list

Threat Ranks =

0.1 = Seriously threatened in California

0.2 = Moderately threatened in California

Table C-2. Special-status Animal Species

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Invertebrates			
Branchinecta lynchi vernal pool fairy shrimp	FT/-	Endemic to the grasslands of the Central Valley, Central Coast mountains, and South Coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	**None.** Suitable habitat is not present in the BSA.
Danaus plexippus monarch butterfly	SC	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby. Closed-cone coniferous forest.	**None.** Suitable habitat is not present in the BSA.
Desmocerus californicus dimorphus valley elderberry longhorn beetle	FT/-	Occurs only in the Central Valley of California, in association with blue elderberry (*Sambucus mexicana*). Prefers to lay eggs in elderberries 2-8 inches in diameter; some preference shown for "stressed" elderberries.	**None.** Suitable habitat is not present in the BSA. No elderberry plants are present.
Lepidurus packardi vernal pool tadpole shrimp	FE/-	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass-bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	**None.** Suitable habitat is not present in the BSA.
Amphibians and Reptiles			
Ambystoma californiense California tiger salamander	FT/ST, SSC	Central Valley distinct population segment (DPS) federally listed as threatened. Santa Barbara and Sonoma County DPS federally listed as endangered. Need underground refuges, especially ground squirrel burrows, and vernal pools or other seasonal water sources for breeding.	**Not expected.** Suitable aquatic habitat is not present in the BSA. The BSA is greater than 1.3 miles (migratory distance) from known occurrences of this species.
Anniella pulchra Northern California legless lizard	-/SSC	Sandy or loose loamy soils under sparse vegetation. Soil moisture is essential. They prefer soils with a high moisture content.	**None.** Suitable habitat is not present in the BSA.
Arizona elegans occidentalis California glossy snake	SSC	Patchily distributed from the eastern portion of San Francisco Bay, southern San Joaquin Valley, and the Coast, Transverse, and Peninsular	**None.** Suitable habitat is not present in the BSA.

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
		ranges, south to Baja California. Generalist reported from a range of scrub and grassland habitats, often with loose or sandy soils.	
Emys marmorata western pond turtle	-/SSC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation, below 1,830 meters elevation. Need basking sites and suitable upland habitat (sandy banks or grassy open fields) up to 0.5 kilometer from water for egg-laying.	None. Suitable habitat is not present in the BSA.
Masticophis flagellum ruddocki San Joaquin coachwhip	-/-/SSC	Open, dry habitats with little or no tree cover. Found in valley grassland and saltbush scrub in the San Joaquin Valley. Needs mammal burrows for refuge and oviposition sites.	Not expected. Marginally suitable habitat is present in the BSA.
Masticophis lateralis euryxanthus Alameda whipsnake	FT/ST	Typically found in chaparral and scrub habitats but will also use adjacent grassland, oak savanna and woodland habitats. Mostly south-facing slopes and ravines, with rock outcrops, deep crevices or abundant rodent burrows, where shrubs form a vegetative mosaic with oak trees and grasses.	None. Suitable habitat is not present in the BSA.
Phrynosoma blainvillii Coast horned lizard	SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	Not Expected. Marginally suitable habitat is present in the BSA.
Rana draytonii California red-legged frog	FT/SSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	None. Suitable habitat is not present in the BSA.
Spea hammondii Western spadefoot toad	SSC	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	None. Suitable habitat is not present in the BSA.
Thamnophis gigas giant garter snake	FT/ST	Prefers freshwater marsh and low-gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the garter snakes in California.	None. Suitable habitat is not present in the BSA.

Appendix C: Special-status Species Tables

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Birds			
Agelaius tricolor Tricolored Blackbird	-/SC, SSC	Highly colonial species, most numerous in Central Valley and vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few kilometers of the colony.	Not expected. Marginally suitable foraging habitat is present in the vicinity of the BSA. Suitable nesting habitat is not present. CNDDB known occurrences within 5 miles of the BSA (CDFW 2022).
Athene cunicularia burrowing owl	-/SSC	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	Possible. Potentially suitable foraging habitat is present and there are known CNDDB occurrences within 5 miles of the BSA (CDFW 2022). The BSA is not anticipated to provide suitable nesting habitat due to the lack of burrows observed during May 2022 reconnaissance survey.
Ammondramus savannarum Grasshopper sparrow	SSC	Dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs and scattered shrubs. Loosely colonial when nesting.	None. Suitable habitat is not present in the BSA.
Asio flammeus Short-eared owl	SSC	Found in swamp lands, both fresh and salt; lowland meadows; irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.	None. Suitable habitat is not present in the BSA.
Buteo swainsoni Swainson's Hawk	-/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	Present. Potentially suitable foraging habitat is present in the vicinity of the BSA. This species is not anticipated to nest within the BSA, but may nest in the

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
			vicinity. No suitable nest trees are present within the BSA. Observed one individual during reconnaissance survey May 2022.
Circus hudsonius Northern harrier	SSC	Coastal salt and freshwater marsh. Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	None. Suitable habitat is not present in the BSA.
Coccyzus americanus occidentalis Western yellow-billed cuckoo	FT/SE	Riparian forest nester along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.	None. Suitable habitat is not present in the BSA.
Elanus leucurus White-tailed kite	FP	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Not expected. Marginally suitable foraging habitat is present in the vicinity of the BSA. Suitable nesting habitat is not present.
Lanius ludovicianus loggerhead shrike	-/SSC	Broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	Not expected. Marginally suitable foraging habitat is present in the BSA.
Melospiza melodia Song Sparrow ("Modesto" population)	-/SSC	Emergent freshwater marshes, riparian willow thickets, riparian forests, and vegetated irrigation. Inhabits cattails (*Typha* spp.), bulrush (*Schoenoplectus* spp.) and other sedges; also known to frequent tangles bordering sloughs.	None. Suitable habitat is not present in the BSA.
Vireo bellii pusillus Least Bell's Vireo	FE/SE	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 610 meters (2,000 feet). Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, *Baccharis*, mesquite.	None. Suitable habitat is not present in the BSA.
Fish			

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Hypomesus transpacificus Delta smelt	FT/SE	Sacramento–San Joaquin River Delta. Seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay. Seldom found at salinities > 10 parts per thousand; most often at salinities < 2 parts per thousand.	None. Suitable habitat is not present in the BSA.
Oncorhynchus mykiss irideus steelhead – Central Valley DPS	FT/-	Populations in the Sacramento and San Joaquin Rivers and their tributaries.	None. Suitable habitat is not present in the BSA.
Mammals			
Antrozous pallidus Pallid bat	-/SSC	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Corynorhinus townsendii Townsend's big-eared bat	-/SSC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. This species generally roosts in caves, abandoned mines, and occasionally buildings and is extremely sensitive to human disturbance (Pierson and Rainey 1998).	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Eumops perotis californicus western mastiff bat	-/SSC	Many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	Possible. Suitable roosting habitat is not present in the BSA. This species may forage in the BSA.
Neotoma fuscipes riparia riparian (=San Joaquin Valley) woodrat	FE/SSC	Riparian areas along the San Joaquin, Stanislaus, and Tuolumne Rivers. Needs areas with mix of brush and trees. Needs suitable nesting sites in trees, snags, or logs.	None. Suitable habitat is not present in the BSA.
Sylvilagus bachmani riparius riparian brush rabbit	FE/SE	Riparian areas on the San Joaquin River in northern Stanislaus County. Dense thickets of wild rose, willows, and blackberries.	None. Suitable habitat is not present in the BSA.
Taxidea taxus American badger	-/SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	Not Expected. Marginally suitable habitat is present in the BSA. No dens were observed during the reconnaissance survey.

Scientific/Common Name	Status (Federal/ State)	Habitat	Potential to Occur in the Project Area
Vulpes macrotis mutica San Joaquin kit fox	FE/ST	Annual grasslands or grassy open stages with scattered shrubby vegetation. Needs loose-textured sandy soils for burrowing and suitable prey base.	Possible. No dens were observed during the May 2022 reconnaissance survey; however, this species is known from the vicinity of the BSA.

Status Legend

Federal:

FE = federally listed as endangered

FT = federally listed as threatened

- = no listing status

State:

SC = state candidate for listing as threatened or endangered

SE = state listed as endangered

SSC = California species of special concern

ST = state listed as threatened

FP = fully protected

Construction Site Well Review (CSWR) ID: 1012667

Assessor Parcel Number(s): 25302012, 24014033, 24401008, 25311020, 25311002, 25311029, 25311030, 24014021, 24402031, 24401007

Property Owner(s): Union Pacific Railway

Project Location Address: Corral Hollow Road and Linne Road Tracy, California 95376

Project Title: 2022110250: Linne Road/Corral Hollow Road Intersection Improvement Project

Public Resources Code (PRC) § 3208.1 establishes well reabandonment responsibility when a previously plugged and abandoned well will be impacted by planned property development or construction activities. Local permitting agencies, property owners, and/or developers should be aware of, and fully understand, that significant and potentially dangerous issues may be associated with development near oil, gas, and geothermal wells.

The California Geologic Energy Management Division (CalGEM) has received and reviewed the above referenced project dated 12/15/2022. To assist local permitting agencies, property owners, and developers in making wise land use decisions regarding potential development near oil, gas, or geothermal wells, the Division provides the following well evaluation.

The project is located in San Joaquin County, within the boundaries of the following fields:

N/A

Our records indicate there are no known oil or gas wells located within the project boundary as identified in the application.

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0

- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

As indicated in PRC § 3106, the Division has statutory authority over the drilling, operation, maintenance, and abandonment of oil, gas, and geothermal wells, and attendant facilities, to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil, gas, and geothermal deposits; and damage to underground and surface waters suitable for irrigation or domestic purposes. In addition to the Division's authority to order work on wells pursuant to PRC §§ 3208.1 and 3224, it has authority to issue civil and criminal penalties under PRC §§ 3236, 3236.5, and 3359 for violations within the Division's jurisdictional authority. The Division does not regulate grading, excavations, or other land use issues.

If during development activities, any wells are encountered that were not part of this review, the property owner is expected to immediately notify the Division's construction site well review engineer in the Northern district office, and file for Division review an amended site plan with well casing diagrams. The District office will send a follow-up well evaluation letter to the property owner and local permitting agency.

Should you have any questions, please contact me at (805) 937-7246 or via email at Miguel.Cabrera@conservation.ca.gov.

Sincerely,

Miguel Cabrera
Northern District Deputy

GOVERNOR'S OFFICE OF PLANNING AND RESEARCH
Dec 15 2022
STATE OF CALIFORNIA

COMMENTS TO REQUEST FOR REVIEW FOR THE MITIGATED NEGATIVE DECLARATION, LINNE ROAD/CORRAL HOLLOW ROAD INTERSECTION IMPROVEMENT PROJECT, SCH#2022110250, SAN JOAQUIN COUNTY

Pursuant to the State Clearinghouse's 14 November 2022 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Mitigated Negative Declaration* for the Linne Road/Corral Hollow Road Intersection Improvement Project, located in San Joaquin County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore, our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of

Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at:

https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4684 or Peter.Minkel2@waterboards.ca.gov.

Agenda Item 3.B

RECOMMENDATION

The Planning Commission recommends that the City Council conduct a public hearing and, upon conclusion, introduce an Ordinance:

1) **Certifying, in accordance with the California Environmental Quality Act (CEQA), an Environmental Impact Report (EIR), adopting a Mitigation Monitoring and Reporting Program (MMRP), and making findings of fact and a statement of overriding considerations, for the annexation and future development of industrial buildings on the 191.18 acre property located at the northeast corner of Grant Line and Paradise Roads (Assessor's Parcel Numbers 213-170-14, -24, -25, -26, -27, And -48), collectively the Property;**

2) **Amending the Northeast Industrial ("NEI") Specific Plan to add the Property to the NEI Specific Plan Area with a land use designation of Light Industrial (SPA22-0003);**

3) **Approving the prezoning of the Property to NEI Specific Plan Zone (AP20-0003); and**

4) **Approving the submittal of a petition to the San Joaquin County Local Agency Formation Commission for annexation of the Property to the City of Tracy.**

EXECUTIVE SUMMARY

The Planning Commission recommends that the City Council adopt an Ordinance effectuating the various actions stated in the title above (collectively, the Project). The Property consists of six (6) separate parcels totaling approximately 191.18 acres owned by three different parties, who collectively are the Project applicants: the Tracy Alliance Group owns two parcels totaling approximately 122.44 acres; Suvik Farms, LLC, owns three parcels totaling approximately 46.61 acres; and Zuriakat owns one parcel of approximately 22.17 acres. All three property owner groups have signed the Project applications.

The proposed NEI Specific Plan land use and prezoning designations would allow development of the Property with approximately 3.3 million square feet of warehouse and related uses, subject to the issuance of one or more Development Review Permits pursuant to Article 30 (Chapter 10.08 – Development Review) of the Tracy Municipal Code, and the Environmental Impact Report (EIR) evaluates the potential environmental effects from this level of development. On January 25, 2023, the Planning Commission considered the EIR and voted 4 to 0 (one member was absent) to recommend that the City Council certify the EIR as adequate and in full compliance with the California Environmental Quality Act (CEQA) requirements and approve the applications noted above. Council considered the applications on August 15, 2023, and continued the hearing to November 7, requesting additional steps be taken by the applicant to address comments received regarding potential air quality and traffic impacts.

Between August 13 and October 9, 2023, the City received ten additional comment letters on the EIR and the Project, including a letter from the Project applicants proposing to modify the Project by incorporating various additional design and operational features intended to address the comments on the Project's potential air quality, truck traffic and energy use impacts.

(Attachment D). An Errata has been prepared to the Final EIR to provide written responses to the last ten comment letters (See Attachment F).

BACKGROUND AND LEGISLATIVE HISTORY

The Property has been located within the City's Sphere of Influence (SOI) since the July 1993 General Plan Update (Attachment A). In the 30 years since the Property has been within the SOI, it has been designated Industrial by the City's General Plan. Lands within the City's SOI can be pursued for annexation into the City limits and, upon approval of annexation by the San Joaquin County Local Agency Formation Commission (LAFCo), become the subject of development applications presented to the Planning Commission and City Council. In 2019, LAFCo approved the City's Municipal Services Review, which shows the Property is located within the 10-year planning horizon. LAFCo policies require 10 and 30-year "horizons" in an effort to plan for and evaluate upcoming development within the City's SOI. LAFCo's policies allow for the annexation of lands within both the 10- and 30-year horizons, with lands in the 10-year horizon anticipated (though not required) to be annexed first, as landowner demand for development of properties is not controlled by the City.

When annexing property into the City, pre-zoning must be established to determine the zoning designation that will take effect upon annexation approval by LAFCo. The proposed zoning is the City's existing NEI Specific Plan Zone, as set forth in Tracy Municipal Code Section 10.08.3022. Because the Property is not yet within the NEI Specific Plan area, the addition of this Property to the NEI Specific Plan Zone would also require an NEI Specific Plan amendment (Attachment B), revising the boundary map of the Specific Plan area to include the Property and assigning the Property a land use designation of Light Industrial. Any future development of the Property would be required to comply with the design and development requirements of the NEI Specific Plan.

On January 25, 2023, the Planning Commission held a public hearing and voted 4 to 0, with one member absent, to recommend that the City Council adopt an ordinance to certify the EIR, amend the NEI Specific Plan, pre-zone the Property, and authorize the submittal of a petition to LAFCo to annex the Property to the City.

On August 15, 2023, the City Council held a public hearing and after discussion and deliberation voted 4-1 to continue consideration to November 7, 2023.

ANALYSIS

Project Proposal

The proposed Project would establish land use and zoning designations for the Property that would govern development of the Property upon its annexation to the City. The proposed land use and zoning designations would allow for development of up to 3,352,320 square feet of warehouse and distribution and related uses on the Property, subject to the subsequent issuance of one or more Development Review Permits pursuant to Article 30 (Chapter 10.08 – Development Review) of the Tracy Municipal Code.

The Property is within unincorporated San Joaquin County adjacent to the City's northeastern City limits and adjacent to the City's NEI Specific Plan area (Attachment A). Any development of the Property in the City would require approval of annexation into the City by the San Joaquin

LAFCo, an amendment to the NEI Specific Plan, pre-zoning, a Tentative Parcel Map or Lot Line Adjustment(s) to create the final lot configurations, and one or more Development Review Permits. Because the applicants have not yet determined the ultimate lot configurations or finalized any development plans, any applications for tentative maps, lot line adjustments or development review permits would be processed at a later date by City staff.

Land use, Zoning and Specific Plan

The subject Property is within the City's SOI, with a General Plan land use designation of Industrial. The applicants propose to annex the Property into the City Limits, amend the NEI Specific Plan to incorporate the Property and assign it a land use designation of Light Industrial, and assign it a zoning designation of NEI Specific Plan Zone. This zoning for the site is logical as it is adjacent to the existing NEI Specific Plan area and all the adjacent properties in the City are developed with warehouses, as is proposed for the Property. This is also consistent with the General Plan designation of Industrial, which was assigned to the Property when it was first added to the SOI in 1993 and has remained since that time. The proposed revisions to bring the Property within the coverage of the NEI Specific Plan can be found in Attachment B. The NEI Specific Plan is the principal planning document for the area, and approximately 80% of the existing Specific Plan area is already developed. In accordance with the City's General Plan policies, including Land Use Objective 2.3, the annexation and development of this acreage are consistent with the expansion of the City's industrial base.

Timing of Development

With the Property divided among three property owners, staff expects development of the Property to occur in three phases, with the Tracy Alliance Group expected to develop its portion of the Property first. Based on preliminary site plans provided by the Group, this first phase is expected to include three warehouse buildings totaling approximately 1.8 million square feet on the Group's 122.44 acres (Attachment C). Staff has no specific information about the timing of development on the Suvik Farms and Zuriakat parcels.

Applicant's Proposed Project Design Modifications

During the City Council discussion on August 15, 2023, 21 members of the public commented, with approximately half in favor of the Project and half opposed. Those opposed cited several issues, though the majority of the comments focused on concerns about air quality and truck traffic, both existing and potentially caused or increased by the proposed project. There were also a number of comments regarding the potential negative effects of the Project on the residents of the nearby Banta community in unincorporated San Joaquin County. In response to these comments, Council continued the hearing to this meeting and encouraged staff to work with the applicants to further address the Project's potential impacts.

On October 9, 2023, one of the Property owner groups, the Tracy Alliance Group, submitted a letter proposing to modify the Project by incorporating various additional design and operational features intended to address the comments on the Project's potential air quality, truck traffic and energy use impacts (See Attachment D). City staff has confirmed with the other two Property owner groups that they are aware of and support the Tracy Alliance Group's proposal.

City staff and the City's environmental consultant have evaluated the Tracy Alliance Group's proposed design changes and determined that they would not change the analyses or

conclusions of the EIR or require recirculation of the Draft EIR. And while staff could support the incorporation of many of the proposed modifications to the applicant's proposed project, the actions presently before the City Council are legislative actions (i.e., the NEI Specific Plan amendment and pre-zoning) that do not involve the issuance of a development review permit or other permit for construction, and therefore are not actions upon which the City could impose conditions of approval to effectively ensure that the proposals would be implemented. In addition, staff has determined that certain of the proposals are either inconsistent with certain laws and City policies and cannot be implemented without a legally viability mechanism, such as a development agreement, which the Project applicants have not requested, or are dependent upon many complex and uncertain third-party actions such that the proposed benefits may be unachievable in the end. As such, applicants' latest 'enhanced project proposals' are not included in the current Project that is before the City Council. Should the City Council approve the proposed Project, these project proposals can be reconsidered by staff during subsequent development applications, such as for a subdivision map or a development review permit.

CEQA DETERMINATION

The Project is subject to the environmental review requirements of CEQA. On August 28, 2020, the City published a Notice of Preparation (NOP) for the EIR, to solicit comments from responsible agencies, various City departments, and the public regarding what areas and issues should be studied in the EIR. A scoping meeting for that NOP was held by the Planning Commission on September 9, 2020, after which the EIR analysis commenced. On April 20, 2022, the City published a Notice of Availability for the Draft EIR (Attachment E), notifying the public of its publication and of opportunities for public review and comment, and a public hearing to solicit comments was held on May 25, 2022. The public comment period closed on June 3, 2022. On January 25, 2023, the Planning Commission considered the EIR and voted 4 to 0 (one member was absent) to recommend that the City Council certify the EIR as adequate and in full compliance with CEQA requirements.

During the public comment period for the Draft EIR, the City received six written comment letters, and one verbal comment at the Planning Commission hearing. Five (5) additional comment letters were received after the close of the public comment period. Two were received in August 2022, shortly after the close of the public comment period. Two additional comment letters, both from the Sierra Club, were received in February 2023, eight months after the close of the public comment period and several weeks after the Planning Commission's January 25 hearing. A fifth comment letter, from the law firm of Shute Mihaly & Weinberger on behalf of the Sierra Club, was received April 13, 2023. In response to the Sierra Club's comments, Mitigation Measure AIR-1.e was revised to add signage requirements to control truck traffic entering and exiting the Project site and to advise truck drivers that truck traffic to and from the Project site is not permitted in the community of Banta in unincorporated San Joaquin County, to the east of the Project site.

Immediately prior to the August 15, 2023 City Council hearing, an additional nine comment letters were received, including a third comment letter from the Sierra Club received on the date of the hearing, August 15, 2023. Finally, and as noted above, on October 9, 2023, the City received a tenth comment letter from the applicants proposing changes to the Project in response to the Sierra Club's letters and the comments and discussion at the August 15 hearing. An Errata has been prepared to the Final EIR to provide written responses to the last ten comment letters (See Attachment F).

The analyses of the potential environmental effects as noted in the Draft and Final EIRs results in the conclusion that some impacts of the proposed Project are potentially significant and unavoidable. These include the following:

- Project-level conversion of prime farmland
- Cumulative conversion of prime farmland
- Project-level impact related to implementation of the applicable air quality plan
- Project-level impact related to cumulatively considerable net increase of reactive organic gases and carbon monoxide during construction, and reactive organic gases and oxides of nitrogen during operation
- Project-level impact related to exposing sensitive receptors to substantial pollutant concentrations
- Cumulative air quality impact
- Project-level vehicle miles traveled (VMT) impact
- Cumulative VMT impact

The State Guidelines for CEQA provide that "no public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more potentially significant environmental effects of the project unless the public agency makes one or more written findings for each of those potentially significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

> (1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.
> (2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
> (3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR." (Guidelines, § 15091).

These required findings must be supported by substantial evidence in the record. The required findings are set forth in Attachment G (CEQA Findings).

CEQA further requires that a lead agency (the City) balance the benefits of a project against its unavoidable environmental risk in determining whether to approve the Project. If the benefits outweigh the unavoidable adverse effects, those effects may be considered "acceptable" pursuant to CEQA Guidelines Section 15093(a). CEQA requires that a lead agency support, in writing, the specific reasons for considering a project acceptable when significant impacts are infeasible to mitigate. Those reasons must be based on substantial evidence in the EIR or elsewhere in the administrative record pursuant to CEQA Guidelines Section 15093(b). The lead agency's written reasons are referred to as a Statement of Overriding Considerations. This Statement of Overriding Considerations is also set forth in Attachment G (CEQA Findings).

In addition, as required by Section 15097 of CEQA's implementing regulations, the City has prepared a Mitigation Monitoring and Reporting Program ("MMRP") to ensure that, if the Project is approved, the mitigation measures in the EIR will be implemented appropriately. The MMRP can be found in Attachment H.

PUBLIC OUTREACH / INTEREST

This item was duly noticed in the local newspaper and public hearing notices were mailed to all owners of property within 300 feet of the subject site. There was additional outreach throughout the CEQA process where, at each stage, the various portions of the project's CEQA review (NOP, DEIR, FEIR) were posted with the State Office of Planning and Research, the San Joaquin County Clerk, posted on the City's website, and mailed/emailed to all interested parties on the Tracy Alliance and overall CEQA interested parties lists.

The Planning Commission met and considered this agenda item on January 25, 2023. After hearing from staff, the applicant, and various interested parties, voted 4-0 (with one member absent) to recommend that City Council certify the EIR and approve the applications.

COORDINATION

This development application was reviewed by multiple City Departments and the South San Joaquin County Fire Authority as part of the City's normal application review process. As a part of the Project review, the EIR was also provided to the State Office of Planning and Research, various State and County agencies, posted at the San Joaquin County Clerk's office and on the City's website. This staff report was prepared by the Development Services Planning Division.

FISCAL IMPACT

This agenda item will not require any expenditure of funds. A Cost Recovery Agreement was executed with the applicants at the time of application, with the applicants reimbursing the City for all the costs associated with the review of the applications, including the EIR.

ACTION REQUESTED OF THE CITY COUNCIL

The Planning Commission recommends that the City Council approve an Ordinance in substantially the form of Exhibit 1 to Attachment I, to:

1. Certify, in accordance with the California Environmental Quality Act (CEQA), an Environmental Impact Report (EIR), adopting a Mitigation Monitoring and Reporting Program (MMRP), and making findings of fact and a statement of overriding considerations, for the annexation and future development of industrial buildings on the 191.18 acre property located at the northeast corner of Grant Line and Paradise Roads (Assessor's Parcel Numbers 213-170-14, -24, -25, -26, -27, and -48), collectively the Property; and

2. Amend the NEI Specific Plan to add the property to said Specific Plan with a land use designation of Light Industrial (SPA22-0003); and

3. Approve the prezoning of the property to northeast industrial specific plan zone (AP20-0003); and

4. Approve the submittal of a petition to the San Joaquin County LAFCo to annex the property to the City of Tracy.

INTRODUCTION

The 1,061-acre Northeast Industrial Area Specific Plan aims to develop a well-planned industrial zone that will attract businesses to Tracy, and provide local employment opportunities. The Specific Plan anticipates a mixture of industrial uses, including rail-dependent industries and "flex-tech" light industrial.

PLANNING AREA LOCATION

Location

The Northeast Industrial planning area lies along the northeast boundary of the City of Tracy. The area is generally bounded to the north by 1-205, to the south by the Southern Pacific Railroad tracks, to the east by Banta Road, and the west by MacArthur Drive. Grant Line Road bisects the area.

Surrounding Land Uses

Presently, properties along MacArthur Drive directly west of the site are developed with industrial uses, such as the U.S. Cold Storage facility. North of the site are industrial and commercial uses, including the Tracy Outlets at MacArthur Drive and Pescadero Avenue. The Yellow Freight Company is also located to the north, between the site and 1-205. Agricultural uses are found on lands to the east.

Lands directly to the north and west of the site are included in the I-205 Corridor Specific Plan and the 1988 Industrial Areas Specific Plan. To the east is the residential Banta area of the county. The project site in the context of the existing industrial and commercial uses, and existing specific plan areas is shown in Figure 1.

Land Ownership

The Northeast Industrial planning area is currently made up of 67 properties, with a variety of owners. Parcels range in size from small half acre home sites to large agricultural and industrial holdings. The assessor's parcel numbers and ownership of the area is shown in Figure 2a and 2b.

EXISTING PLANNING AREA CONDITIONS

Site Features

Land uses within the Northeast Industrial Area are currently light industrial and agricultural, with a number of dairy operations and rural residences remaining. Few other significant site features are present. The topography is relatively level.

A Westside Irrigation District (WSID) supply or tailwater ditch crosses the area. Two properties near I-205 are located just inside the FEMA 100 year flood line found in the vicinity of the I-205/Paradise Road overcrossing. The 100-year floodplain impacts on the NEI Specific Plan area would only result from the unlikely event of a levee failure along the San Joaquin River or Paradise Cut. Furthermore, the volume of the breach flow would need to be sufficient to inundate over 10 square miles prior to flows reaching the NEI area, which is an extreme event. If flood flows reached the NEI, they would fill available storage in the stormwater detention basin below the flood level and any additional flood flow volumes would be pumped into the Eastside Channel. Furthermore, the City's Municipal Code (Title 9 Building Regulations, Chapter 9.52 Floodplain Regulations),

would require all new construction and substantial construction pertaining to buildings have the lowest floor, including basement, elevated to or above the base flood elevation.

The existing conditions of the planning area are shown on Figures 3 and 4.

None of the parcels are under Williamson Act contracts, except for the Suvik Farms parcels (Parcel Numbers 64, 65 and 66 on Figure 2b). The Suvik Farms parcels are covered by an active Williamson Act contract. Pursuant to the applicable provisions of the California Government Code, the Suvik Farms landowners initiated a Notice of Nonrenewal in 2017 for the contract, beginning a nine-year process to formally expire the contract. Based on the date of the Notice of Nonrenewal, the contract will expire on August 21, 2026. Should development of the Suvik Farms parcels be pursued prior to the Williamson Act contract expiration date, the applicant for the development of the Suvik Farms parcels would be required to petition the City Council for cancellation. So long as the cancellation occurs prior to urban development, then no conflicts would occur.

Existing Roadway Network

The Plan area is served by a number of existing roadways, some of which have been improved to meet the circulation needs of the NEI area, and others that will be constructed or improved as traffic demand requires.

Regional access for the area is provided by Interstate 205 (I-205) to the north and Interstate 5 (I-5) to the east. I-205 is an east-west freeway which extends from I-5 west to I-580 with I-580 continuing west into the Bay Area. I-5 is a north-south freeway which extends throughout California. Currently, Plan area access to I-205 is via an interchange at MacArthur Drive. I-5 access is via the full access interchange at Kasson Road (an extension of Grant Line Road). I-5 access is also available (to/from the north only) via an interchange at Eleventh Street. The primary local roadways serving the area are MacArthur Drive, Pescadero Avenue, East Grant Line Road, Chrisman Road and Paradise Road.

RELATIONSHIP TO TRACY'S GENERAL PLAN

General Plan Land Use Designations
The City of Tracy General Plan designates the entire Northeast Industrial area for Industrial land uses. Specific uses allowed in the industrial category range from flex/office space to manufacturing to warehousing and distribution. Ancillary uses, such as restaurants, consumer services, and parks may be allowed to serve the daily needs of the workers.

Tracy's Growth Strategy
The City of Tracy has embraced a "balanced growth" strategy, seeking to direct growth in an efficient, cost-effective manner, balancing land uses and appropriate use of the land with well-planned and utilized infrastructure. This strategy seeks to improve the jobs/housing balance and to encourage development of employment opportunities and capitalize on freeway interchanges with industrial, retail, and service-related development.

The northeastern sector of Tracy has been designated as one area in which the City's industrial growth will occur. Adjacent to existing industrial development and with direct access to the I-205 freeway and rail transportation, the Northeast Industrial area is ideally situated to attract and support business without the need for major infrastructure expenditures.

General Plan Goals Furthered by the Northeast Industrial Area Development
The Northeast Industrial Specific Plan proposes development consistent with the General Plan. It furthers many of the Goals and Policies stated in the General Plan and it implements many of the Actions set forth in the General Plan. Following is a summary of General Plan Goals, Policies, and Actions to which the Northeast Industrial Specific Plan contributes.

Land Use

Objective LU-1.1 Establish a clearly defined urban form and city structure.

Policy P1: New development and redevelopment in existing areas shall be organized as a series of residential Neighborhoods, Employment Areas, Corridors, Village Centers, the Downtown and the I-205 Regional Commercial Area.

- Employment Areas are the job-centers of the city and include office districts, retail centers and industrial areas.

Objective LU-2.3 Expand the City's industrial base.

Policy P1: The Northeast Industrial Area should contain a mix of heavy industrial, light industrial, warehouse, and distribution users to maximize rail and highway access on large parcels of land. The Northeast Industrial Area should also contain commercial uses and services to meet the daily needs of workers.

Objective LU-6.2 Ensure land use patterns that minimize conflicts between transportation corridors and neighboring uses.

Policy P1: Uses that are compatible with the noise, air quality and traffic impacts associated with freeways, such as auto-oriented commercial and industrial uses, should be located near and along freeway corridors whenever possible.

Economic Development

Objective ED-4.1 Ensure an adequate, balanced supply of all land uses for future economic development.

Action A1: Monitor current and future land supply needs for industrial, office and retail growth.

Objective ED-6.3 Promote expansion in the Northeast Industrial Area.

Policy P1: The City shall encourage and facilitate the development and buildout of the entire 870-acre Northeast Industrial Area.

Policy P2: The City shall direct business attraction efforts to manufacturing uses, rather than warehouse distribution facilities, due to their higher employment densities.

Policy P3: Developers should consider flexible facility design and construction types that can accommodate future manufacturing uses with higher employment densities.

Policy P4: The City should support efforts to attract private developers and equity investors to participate in the development of the area.

Community Character

Objective CC-11.2 Encourage attractive design in Employment Areas.

Policy P1: Development in Employment Areas should adhere to high-quality design standards.

Policy P4: Building setbacks for office buildings or office portions of industrial buildings should be minimized to ensure that buildings define the edges of the street.

Policy P6: Loading facilities in Employment Areas should be screened from view from public streets to the extent possible.

Policy P9: Fencing visible from the public right-of-way shall be visually appealing when used in industrial and commercial developments.

Objective CC-11.3 Minimize the impact of parking on the pedestrian environment in Employment Areas.

Policy P1: The impact of parking in Employment Areas on the pedestrian environment should be minimized with attractive landscaping.

Policy P2: Parking lots should be set back from the street with a landscaped buffer wherever possible.

Circulation

Objective CIR-1.4 Protect residential areas from commercial truck traffic.

Policy P1: Significant new truck traffic generating uses shall be limited to locations along designated truck routes, in industrial areas or within ¼-mile of freeways.

PROJECT CHARACTERISTICS

Project Objectives
The objectives of the project are:

- To develop the Northeast Industrial Area as a high-quality industrial and commercial site of significant benefit to the City of Tracy and the nearby region.
- To develop a well-planned site that will attract businesses to Tracy, providing local employment opportunities.
- To develop the Northeast Industrial Area for primarily mixed industrial uses, including rail-dependent industries.
- To minimize project-related impacts to Tracy's transportation network.
- To provide a flexible phasing program that allows market forces to dictate reasonable growth increments, while ensuring that agricultural properties are allowed to remain until ready to develop.
- To create a project consistent with the goals of the General Plan.
- To integrate the Northeast Industrial Area into the development pattern of the City of Tracy.
- To integrate mitigation for environmental impacts into the design of the project.

Land Use Designations
The Northeast Industrial Area will consist primarily of light industrial land uses. In addition, general commercial land uses are planned at major intersections along Pescadero Avenue and Grant Line Road. Figure 5 shows the configuration of the land uses in the planning area.

The development prototypes included in the Design Guidelines indicate possible site planning scenarios for environmental impact analysis.

Light Industrial Land Uses (LI)
Light Industrial land uses cover approximately 990 acres of the planning area. Assuming a Floor Area Ratio (FAR) of 0.5, approximately 21.6 million square feet of light industrial, warehouse and manufacturing facilities would be provided. Light industrial land uses would be compatible with existing industrial land uses to the west and north, as well as with freeway noise, and rail noise and vibration.

Several types of light industrial land uses are appropriate in the Northeast Industrial Area. It is anticipated that warehousing and distribution businesses with low employee densities will be the predominant development type. This development pattern is similar to those that have located in Tracy in recent years. The southern portion of the Planning Area is appropriate to uses that require rail access.

The City of Tracy is also interested in attracting higher employee density businesses to the area. It is anticipated that there may be a future demand for a "Flex-Tech" development that would accommodate research & development businesses and call centers.

The light industrial zone may also be appropriate for service commercial businesses with little pedestrian traffic, that are not necessarily compatible with general commercial land uses, such as automotive supply and plumbing stores. Commercial development may be permitted on sites designated Light Industrial without the site being redesignated General Commercial if:

1. The site is a minimum of one acre and located on the northwest or southwest corners of Pescadero Avenue and Paradise Road or the northwest or southwest corners of Grant Line Road and Paradise Road.
2. The site has City Engineer-approved access from at least two streets.
3. The proposal is for a convenience retail or general commercial service use to the industrial area, such as restaurants, hotels, or convenience stores and service stations.
4. 15,000 square feet of retail within an industrial warehouse located on the southwest corner of Chrisman Road and Paradise Road.

A variety of parcel sizes are foreseeable, probably ranging from 5 to 50 acres, depending upon the type of industrial user attracted to the area. Since market forces will dictate that eventual parcel size, the Specific Plan does not reflect an exact parcelization plan.

Existing Agricultural and Residential Uses
The parcels containing former dairy operations; existing agricultural operations, and/or former or existing residences, may remain in operation until ready to develop. The planned light industrial land uses will be compatible with these properties. (The agricultural lands are subject to the City's Right to Farm Ordinance, discussed below)

General Commercial Land Uses (GC)
Three parcels of general commercial, totaling 45.5 acres are provided within the planning area. These commercial sites are intended to expand upon the existing commercial uses adjacent to the I-205/ MacArthur Drive interchange, take advantage of the freeway-oriented traffic circulation of the site, and serve the local industrial community. The largest parcel (25.5 acres) is located in the northwest comer of the project along Pescadero Avenue. This parcel provides for potential factory outlet expansion or other interstate-related commercial uses. General Commercial land uses provide for service commercial oriented land uses, such as animal shelters, who's land use characteristics are compatible with industrial uses.

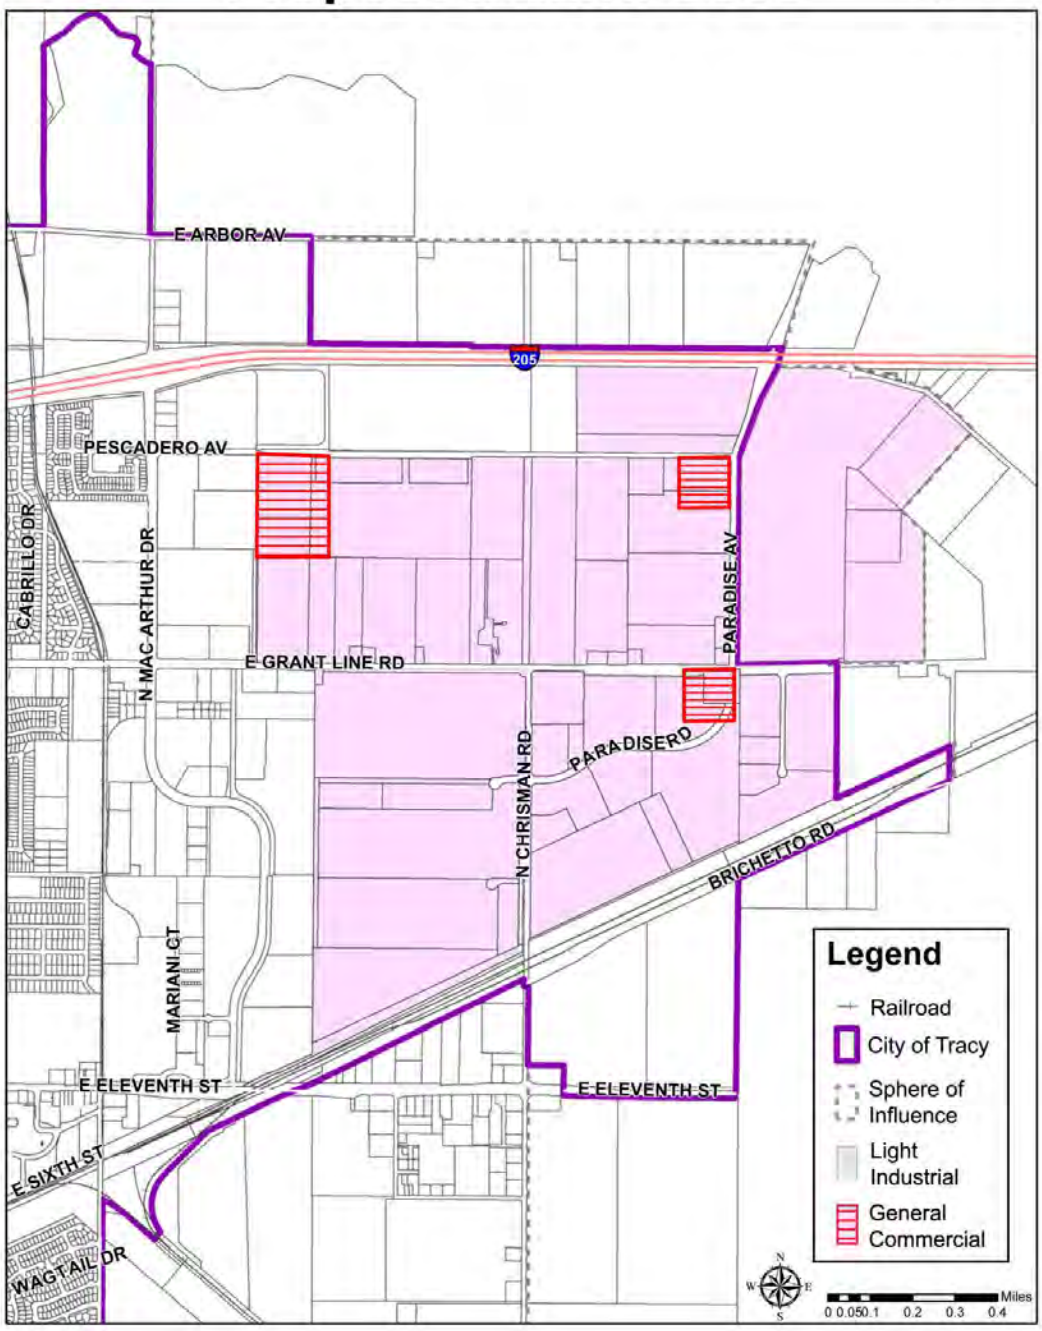
Right to Farm Provisions
Agricultural operations currently exist within the Northeast Industrial planning area. This Specific Plan intends to allow the continued operation of these existing agricultural uses until such time as the owners wish to convert their property to nonagricultural uses.

When nonagricultural land uses move into areas near to pre-existing agricultural operations, the agricultural operations frequently become the subject of nuisance complaints. Chapter 10.24 of the Tracy Municipal Code, the Right to Farm Ordinance, declares that farming operations are not a nuisance, and recognizes the right to farm within the incorporated City. Agricultural and dairy operations are included in the Permitted Uses (page 36) for both the Light Industrial and General Commercial land use designations.

Mineral Extraction
A number of the parcels in the Northeast Industrial planning area have mineral rights that are owned by different owners than the underlying land. It is possible that these owners may choose to exercise these rights at some time in the future. As such, mineral extraction is included as a Conditionally Permitted use within the Light Industrial land use designation. Any mineral extraction operation will be unobtrusive, and will be a subsidiary use to the primary use of the parcel.

Proposed Land Uses

Figure 5



CIRCULATION AND TRANSPORTATION

The Northeast Industrial Specific Plan provides for efficient circulation by automobiles and trucks. The proposed land use mix, street geometry, and proximity to the interstate freeway system will minimize project-related impacts to Tracy's transportation network.

The distribution, location and extent of the roadway improvements within the Specific Plan area shall be subject to the NEI Phase I Finance and Implementation Plans, dated December 1999 (Resolution Numbers 99-462 and 99-485), April 1, 2003 (Resolution Number 2003-100), January 4, 2005 (Resolution Number 2005-023), February 21, 2006 (Resolution Number 2006-069), and April 15, 2008 (Resolution Number 2008-065), and the NEI Phase II Finance and Implementation Plans, dated January 2006 (Resolution Number 2006-038) and January 15, 2008 (Resolution Number 2008-010). All future roadway improvements will also be subject to any revisions or updates to the NEI Finance and Implementation Plans, and subject to the development impact fees as established in those plans. Figures 6 and 7A and 7B show the original roadway network and street sections for the Specific Plan, which will be modified by the Finance and Implementation Plan process.

Water Supply and Distribution

The distribution, location and extent of the water improvements within the Specific Plan area shall be subject to the NEI Phase I Finance and Implementation Plans, dated December 1999 (Resolution Numbers 99-462 and 99-485), April 1, 2003 (Resolution Number 2003-100), January 4, 2005 (Resolution Number 2005-023), February 21, 2006 (Resolution Number 2006-069), and April 15, 2008 (Resolution Number 2008-065), and the NEI Phase II Finance and Implementation Plans, dated January 2006 (Resolution Number 2006-038) and January 15, 2008 (Resolution Number 2008-010). All future water improvements will also be subject to any revisions or updates to the NEI Finance and Implementation Plans, and subject to the development impact fees as established in those plans. Figure 10 shows the original water master plan for the Specific Plan, which will be modified by the Finance and Implementation Plan process.

Police Protection

Police services to the project will be provided by the City of Tracy Police Department.

Fire Protection

The planning area is located within the boundaries of the Tracy Fire Department. The Tracy Fire Department will provide fire protection service and paramedic ambulance service to the planning area.

Other Utilities

Pacific Gas and Electric (PG&E) will provide electricity and natural gas to the planning area. Comcast and/or AT&T will provide telephone/internet service to the planning area.

DESIGN GUIDELINES

The Specific Plan includes design guidelines and development standards to guide site planning and architecture. These design guidelines are similar to those adopted in the Industrial Areas and I-205 Corridor Specific Plans, which are adjacent to the planning area.

Streetscapes

1. The design of the streetscape should integrate, in a consistent and creative manner, plant materials, paths, berming, lighting, and signage to produce an attractive and functional environment.
2. All landscaping should employ a mix of trees, shrubs, groundcovers and turf, where appropriate. The plant palette should be relatively limited and applied in groupings of similar species rather than a few plans of many different species planted together. The use of water conserving plantings, such as California natives and drought tolerant trees, shrubs, and turf is encouraged, and compliance with the state's water efficient landscape guidelines is required.
3. The use of lawn substitutes is encouraged in all medians and for parkways. The use of turf should be minimized and reserved for areas of high use or visibility and temporary median planting in anticipation of future street widths.
4. Automatic irrigation is required for all landscape areas. Plants should be watered and maintained on a regular basis. Irrigation systems should be designed so as not to overspray walks, buildings, and parking areas, etc. The use of water conserving systems, such as drip irrigation for shrub and tree planting, is encouraged.
5. Tree plantings should reflect street hierarchy with larger trees along arterial streets and smaller trees on industrial streets. Tree plantings shall be symmetrical and of the same species in the parkways on both sides of the streets. One tree species or mixture of species shall be planted consistently at regular intervals along the entire length of a street. Spacing interval shall be no greater than 40 feet on center. Where trees are planted in medians, the plantings shall be continuous and at regular intervals. Spacing of median trees shall be no greater than 30 feet on center. Different tree species shall be planted at intersections to highlight these areas.
6. Adequate sight lines shall be maintained at all times

Recommended Trees for Major Streets

The following list identifies recommended trees for the major streets that form the framework of the area:

Street	***Parkway***	***Median***
Grant Line Rd	Pistacia chinensis	Prunus serrulata cvs.
	Chinese Pistache	Flowering Cherry
Paradise Rd/ Loop Rd	Celtis sinensis	Pyrus calleryana 'Bradford'
	Chinese Hackberry	Bradford Pear
Pescadero Ave	Fraxinus oxycarpa 'Raywoodii'	Pyrus calleryana 'Aristocrat'
	Raywood Ash	Aristocrat Pear

Select one of the following street trees for use on each industrial road:

Botanical Name	***Common Name***
Eucalptus gunnii	Cider Gum
Fraxinus oxycarpa 'Raywoodii'	Raywood Ash
Fraxinus uhdei	Evergreen Ash
Platanus acerifolia	Sycamore

Street Lighting

1. Illumination standards for arterial and industrial streets should reflect the different right-of-way widths and functions.
2. Light fixtures and standards shall meet all safety standards and shall be employed throughout the length of the street. It is recommended that one lighting fixture style be employed for use on all streets. Where possible, light standards shall be located in medians.

Building Floor Area Ratio and Height

Land Use	*Max. Floor Area Ratio*	*Max. Building Height*
General Commercial	0.35	46 ft.
Office	0.35	60 ft.
Light Industrial	0.50	60 ft.

Building Setbacks

The following shall be the minimum building and parking setbacks required for all building types. Figure 14 illustrates these guidelines.

1. Building setback from any property line adjacent to a street or Caltrans right-of-way shall be 25 feet minimum. Rear and side yard building setbacks from property lines not adjacent to a street or Caltrans right-of-way shall be 15 feet minimum.
2. A 5 foot wide landscape setback is required along property lines not adjacent to a right-of-way. On the property lines perpendicular to the street frontage on industrial streets, the landscaped setback is only required to a point 150 feet onto the parcel from the street right-of-way or 50 feet back of building face, whichever is greater.
3. Parking setback from any property line along a public street or the Caltrans right-of-way for commercial land uses shall be 10 feet and for industrial uses shall be 15 feet.
4. Parking shall not be permitted within 10 feet of the building entry face of any commercial structure. In the event the building has an arcade or other shade structure along this frontage, the structure can be located within this required setback. Parking shall not be permitted within 15 feet of the office face or portion of a building. On industrial buildings, a 15 foot setback to the parking area shall be provided at building entries.
5. Commercial buildings shall be sited so as to create and enhance the streetscape. This can only be accomplished if all or a portion of the buildings are located near the street. On commercial sites of over 4 acres, at least one building must be located with a minimum setback from public-right-of-way to building face of 50 feet. On corner sites adherence to this requirement is encouraged on both frontages, however, only required on the major street frontage.

Figure 11

Parking and On-Site Vehicular Circulation

1. Parking, on-site circulation, and loading area standards shall be as required by the provisions of Title 10, Article 26, Off-Street Parking Requirements of the Tracy Municipal Code unless modified below or as part of the Development Review approval. Portions of off-street parking requirements are summarize below.
2. Parking lots containing 10-20 spaces may include a maximum of 20% of the total number of spaces for compact cars. These spaces shall be designed and marked in accordance with City standards and distributed throughout the lot. Parking areas containing 20 or more spaces may include a maximum of 30% of the total number of spaces for compact cars.
3. Minimum off-street parking standards:

Uses	***Minimum Parking Spaces Required***
Retail	One space per 250 square feet of gross floor area
Vehicle sales and rentals, including recreational vehicles and mobile homes	One space per 250 square feet of gross floor area plus one space per vehicle for sale or stored on lot.
Office: business, professional (not including medical or dental), banks	One space per 250 square feet of gross floor area
Dental and medical clinics or office	One space per 200 square feet of gross floor area
Motor vehicle repair garages	One space per 600 square feet of gross floor area; repair stalls not counted as parking spaces
Cafes, restaurants, and other establishments for the sale and consumption of food and beverages	Dining: one space per 45 square feet of customer area and one space per 250 square feet of all other area, plus additional spaces connected to uses such as drinking establishments. Drinking bars, cocktail lounge: one space per 35 square feet of drinking, bar, lounge area.
Manufacturing	One space per 600 square feet of gross floor area, or if the number of employees on the maximum work shift can be verified, one space per one employee on the maximum work shift
Warehouses/Storage and Distribution	One space per 1,000 square feet of the first 20,000 square feet of gross floor area, plus one space per 2,000 square feet of the second 20,000 square feet of gross floor area, plus one space per 4,000 square feet of the remaining square feet of gross floor area.

Loading and Unloading Spaces

1. Sufficient off-street loading and unloading spaces shall be provided on each site, and adequate provisions and space shall be made for maneuvering freight vehicles and handling all freight. All loading activity, including turnaround and maneuvering, shall be made on site.
2. In commercial areas, truck loading areas and docks shall not be permitted between building(s) and the public street unless enclosed with architectural screen of material similar to building.
3. In industrial areas, truck loading areas and docks shall not be permitted between building(s) and the street unless the building(s) are set back from the curb a minimum of 125 feet and doors are screened by landscaping, berms, and/or fences.

4. Buildings, structures, and loading facilities shall be designed and placed upon the site so that vehicles, whether rear loading or side loading, may be loaded or unloaded at any loading dock, door, or area without extending beyond the property line.

Figure 12

Driveway Standards

Driveways should be carefully located so as not to impede the primary function of the streets, which is to carry through traffic. It should be noted that these spacing guidelines are minimum values. The goal should be to exceed them where possible.

1. Individual industrial parcels on major arterial streets may have driveways, but they should be carefully located so as not to impede the traffic efficiency. In general, parcels with frontage on the major arterials should have their entryway on side streets if possible. If a parcel's only frontage is on the major arterial, every effort should be made to consolidate access at a single driveway. Spacing standards for driveways on major arterials shall be as follows:
    a. Full access driveways , 500 ft. minimum
    b. Partial access driveways (right in/out, left turn in), 500 ft. minimum
    c. Right turn in and out, 350 ft. minimum upstream from an intersection
    d. Right turn in and out, 200 ft. minimum downstream from an intersection
2. On industrial streets, spacing for full access driveways is 450 feet, minimum. "T" intersections are encouraged over four-way intersections. Every effort should be made to consolidate driveways.
3. No driveway shall be located closer than 200 feet to the radius return point at intersections.
4. Driveways shall be a minimum of 25 feet wide. Subsequent development shall demonstrate driveway width and placement can accommodate truck turning movement and clearing without blocking roadways.
5. Driveway width modifications may be approved with shared (ganged) driveways. Ganged driveways which serve two adjacent sites will be required to install landscaped islands along parking adjacent to the gang driveway and a landscape zone at the end of the common drive will act as a terminus to the view line down the ganged driveway.
    a. Full curb returns (as opposed to a standard driveway) shall be utilized for entries to all sites of over ten acres in size or for common driveways that serve two adjacent sites that together total more than ten acres.
6. Access driveways shall provide adequate length to accommodate off-street vehicle stacking needs during times of peak use.
7. Parcel entry should be clear, attractive, and inviting; circulation should direct employee and visitor traffic clearly through the site to main building entries and drop-off points and service trucks to loading.
8. In commercial areas, vehicular entries to the site shall be well defined and recognizable to motorists. Improvements should include accent paving, signs, special plantings, and lighting. Such improvements shall not block motorists' sight lines to oncoming traffic.

Freeway Interface

The control of views of Tracy from I-205 is critical for the establishment of a quality image for the community.

1. Locate services and storage areas to minimize visibility from I-205.
2. All freeway setback zones shall be planted with a combination of trees, shrubs, and groundcover. Automatic irrigation is required of all planted area. Use large scale trees, from a 24-inch box minimum, grouped in single species clusters. Mass trees to avoid blocking views of commercial signage while providing at least one tree per 1,500 square feet of setback area. Plant shrubs in an informal hedge near the property line with gaps between hedges of 50 feet maximum. Install from 5 gallon cans, minimum, in single species clusters at least 100 feet long. Hydroseed or otherwise install permanent groundcover in all places not planted with shrubs.

Figure 14

Building Architecture

1. Use of creative building design and construction techniques is encouraged. Special attention should be given to that portion of the building visible from adjacent roadways or public parking areas.
2. Large buildings should have facades that include variations in massing, form, and texture. Continuous surface treatments of a single material should be minimized. Architecture should be used to highlight building entries.
3. Any accessory buildings and enclosures, whether attached or detached from the main building, shall be of similar compatible design and materials.
4. Continuous arcades along the front of commercial buildings are encouraged as they provide the pedestrian protection from the weather, reduce solar gain, and can serve to enhance the character of what might otherwise be simple, formless structures. When more than one building is to be developed on a commercial site, the buildings should be designed to relate to one another as a total composition with well thought out relationships to one another.

Signs

1. Signs must conform to the requirements of Signs, Title 10, Article 35 of the Tracy Municipal Code as modified herein.
2. A site sign program should be integrated into a total design concept for a site and its buildings. The primary goal of the project sign system is to provide information and identification. When more than one sign is permitted, all signs shall be of similar style, shape, and materials.
3. All signs must be approved prior to installation, and should be designed in a manner that coordinates the sign designs and locations with the site plan and building architecture for each project. The sign plans should include:
    a. **Detatched Business Identification Signs:** One such monument sign (as defined by the Tracy Municipal Code) shall be allowed for each street frontage of the site. These signs may only contain the symbol and/or name of the business and its street address. The sign shall be free standing, may be double-sided, and shall be set back a minimum of 5 feet from the public right-of-way. Sign area shall not exceed 32 square feet per frontage and sign shall not exceed 6 feet in height from finished grade. Signs should generally be oriented perpendicular to approaching traffic.
    b. **Wall signs:** On large single tenant buildings, signs should be located immediately above or adjacent to the primary building entrance. No sign shall extend above dominant roof lines. The area of any single sign shall not exceed 100 square feet. Total area shall not exceed one-half square foot of sign per lineal foot of business being served.

       On smaller multi-tenant buildings, signs should be located at the frontage of each individual lessee. The area of any single sign shall not exceed 100 square feet nor more than 75 percent of the tenant frontage. Capital letters shall be no more than 2.5 feet in height and lower case letters no more than 1.5 feet in height. When individually-lettered wall signs comprise over 50 percent of the sign area of all sign types, total sign area shall not exceed 1.2 square feet per lineal foot of business being served. When comprising less than 50 percent of the total sign area, the maximum sign area shall be one-half square foot per lineal foot of business being served.
    c. **Directional Signs:** Signs required or desired to assist patrons in accessing the facility shall be located in the site parking areas. The design of such signs shall be simple and easily legible.

There is no limit to the number of signs provided on a site; however, no single sign shall exceed 6 square feet in area, except that vehicular "stop" signs shall be mounted per State standards.

4. A sign may be illuminated provided that no flashing, traveling, animated, or intermittent illumination shall be used. Such illumination shall be confined to the area of the sign except when such illumination is back lighting for an otherwise non-illuminated sign. No sign illumination shall cast a glare which is visible from any street.
5. Signs should be constructed with quality materials and in a craftsman-like manner to ensure both an attractive appearance and durability.

Landscaping

Minimum on-site landscaping requirements shall be established by Off-Street Parking Requirements (Title 10, Article 26 of the Tracy Municipal Code), except as modified below.

Summary of Requirements	***Commercial***	***Industrial***
Landscaped frontage setback	10 feet	15 feet
Minimum number of trees in parking area	1 tree per 5 spaces	1 tree per 10 spaces
Percentage of landscaping in parking areas:		
0 - 15 cars	5%	5%
16 - 30 cars	10%	5%
31-60 cars	15%	7½%
Over 60 cars	20%	10%

1. While commercial uses benefit from a well-landscaped parking area and visibility from the street, views of industrial uses benefit from a more generously landscaped streetscape. Thus, parking lot landscaping requirements for industrial uses may be reduced as specified in the Off-Street Parking Requirements in order to create a large landscape setback along the street. These provisions allow the reduction of 50 percent of the required landscaping based on the provision of a 15 foot landscape setback along the street frontage. The 15 foot strip may be included in the calculation of the total parking lot landscaping requirement. The remainder of the landscaping requirement must be distributed over the lot(s) to provide shade and landscape building frontage. Canopy trees shall be evenly distributed throughout the parking area to provide shade.
2. On-site landscaping along rights-of-way between property lines and buildings, parking lots, or vehicular circulation improvements shall be installed by the property owner. This landscaping shall be designed as an extension of the adjacent public right-of-way landscaping. Completion of landscaping on the site shall be simultaneous with completion of the building and other improvements on the site.
3. Landscaping shall not obstruct sight lines at street or driveway intersections.
4. In place of the wheel stops at parking lots, landscape areas and pedestrian walkways may be extended not more than 2 feet into required parking spaces, to include a 6" concrete curb. In such cases, no credit toward parking lot landscape requirements shall be given for the resulting additional landscaping.
5. Screening of the parking area from public rights-of-way in industrial areas shall be provided with a 2½ to 3 foot high element, measuring from the top of the parking area pavement. Screening may consist of one or a combination of the following:
    a. Berms landscaped with ground cover, trees, and shrubs;
    b. Solid, low profile, decorative masonry walls;
    c. Evergreen shrubbery which, when solely used as screening, shall be continuously maintained to provide solid screening.

6. Generous landscaping screening is required adjacent on all street frontages for industrial areas. These areas should be landscaped with a combination of trees, shrubs, and ground cover to soften views of parking areas.
7. Tree planting and selection and massing should be compatible with streetscape plantings. Provide minimum 1 tree per 400 square feet of landscape setback. The plant palette should be relatively limited and applied in groupings of similar species rather than a few plants of many different species planted together.
8. The use of water conserving plantings, such as California natives and drought tolerant trees, shrubs, and turf is encouraged. The use of turf in the narrow planting islands is discouraged.
9. Live plant materials shall be used in all landscaped areas. The use of gravel, colored rock, bark, and other similar materials are not acceptable as a sole groundcover material.
10. All trees shall be of 24 inch box size minimum at planting with a minimum branching height 5 years after installation of 10 feet above road or parking surfaces and 6 feet at pedestrian areas. Shrubs shall be of 5 gallon size minimum with a maximum on-center spacing of 24 inches. Likewise, groundcover may be planted at 1 gallon size minimum with a maximum spacing of 12 inches on center.
11. Automatic irrigation is required for all landscaped areas. Irrigation systems shall be designed so as not to overspray walks, buildings, and parking areas.

Screening and Storage

1. All exterior trash areas, storage structures, and service areas shall be screened from public view with a wall or fence of a minimum height of 8 feet above the street curb level. Storage areas shall be set back a minimum of 50 feet from streets, unless fully enclosed in an architecturally compatible enclosure.
2. No storage areas are allowed within the landscape easements, front setbacks, or side or rear yard landscaped buffers.
3. Roof-mounted equipment shall be screened from street view. Pad-mounted transformers, utility connections, and meter boxes shall be screened and integrated into the site plan.
4. The design of masonry walls, fencing, trash enclosures, and similar accessory site elements should be compatible with the architecture of the building and should use similar materials. Where masonry walls are along property frontage, they should enhance the entrance to the property and should not impair traffic safety by obscuring views. Long expanses of wall surfaces should be architecturally designed to prevent monotony.
5. The use of chain link fences shall be discouraged, and no chain link fences shall be visible from any public right-of-way.

Development Review Process

All development in the NEI shall be subject to the requirements of Tracy Municipal Code Article 30, Development Review (TMC Sections 10.08.3920 through 10.08.4110).

Environmental Performance Standards

Use Restrictions

No use shall be permitted to exist or operate on any lot which:

1. Emits dust, sweepings, dirt, cinders, fumes, odors, radiation, gases and vapors, or discharges liquid or solid wastes or other harmful matter into the atmosphere or any body of water which may, according to the appropriate agency, adversely affect the health and safety persons within the area or the health and safety of persons in adjacent areas or the use of adjacent properties.

2. Discharges waste or any harmful substance, as defined by the Municipal Code, into any public sewer or storm drainage system.
3. Produces intense glare or heat, unless such use is performed only within an enclosed or screened area, and then only in such manner that glare or heat emitted will not be discernible from any exterior lot line.
4. Creates a sound pressure level in violation of any regulation of any public body having jurisdiction. This requirement shall also be applicable to the disposal of trash and waste materials.
5. Allows the visible emissions of smoke (outside any building) other than the exhausts emitted by motor vehicles or other transportation facilities or any emissions in violation of any regulation of any public body having jurisdiction. This requirement shall also be applicable to the disposal of trash and waste materials.
6. Creates a ground vibration that is perceptible, without instruments, at any point along any of the exterior lot lines.

Hazardous Wastes and Water Pollutants

1. All new industries locating with the area will be required to obtain a Discharge Permit from the Director of Utilities prior to occupancy. This permit shall establish the amount and quality of wastes allowed to be discharged into the City's sanitary sewer.
2. The quality of wastewater entering the city sewage system from the proposed uses shall be measured by the Biochemical Oxygen Demand (BOD) and Total Suspended Solids (TSS) levels referenced in the local Water Quality Control Board 208 Plan. Users that are not expected to comply with these standards will be required to provide on-site pretreatment facilities.
3. The storage and distribution of hazardous materials shall be subject to the rules of the San Joaquin County Health District.
4. Industries regularly using significant quantities of hazardous chemicals as defined by State Law in the course of their operations shall be required to obtain a Conditional Use Permit.

Mineral Extraction

1. Mineral extraction shall only be permitted as a subsidiary use to main use of the site.
2. Locate equipment, storage, and facilities for mineral extraction to avoid visibility from the public street.

Dairy Uses

1. With development applications for an individual site, provide information demonstrating provisions of adequate buffers between proposed development and adjacent existing dairy uses.
2. Existing dairy uses are exempted from the Environmental Performance Standards.

Permitted and Conditionally Permitted Uses

The following table indicates uses which are to be permitted and permitted subject to Conditional Use Permits in the Northeast Industrial area. The land use designations are abbreviated as follows:

LI: Light Industrial
GC: General Commercial

The uses shown in Table 18 as Permitted ("P") are those that are deemed acceptable anywhere in the assigned land use designation. They are uses that, when developed in conformance with this Plan, will not require special conditions in order to avoid negative impacts.

The uses shown as Conditionally Permitted ("C") are of two types. Some of these uses are not acceptable in every location within a land use but are acceptable in certain locations. Other uses may require special conditions to make them acceptable at particular locations, due to their potential negative impacts on existing or planned uses. This may be because of their potential nuisance aspects, such as noise or hazardous wastes.

Where neither a "P" or "C" is shown for a particular land use district, that use is not allowed.

Table 1: Permitted and Conditionally Permitted Land Uses

Land Uses	***LI ●***	***GC***
Agricultural, including dairies	P ◊	P ●, ◊
Accessory uses and structures; not including warehouses located on the same site as a permitted use	P	P
Administrative, executive, research, medical offices	P	P
Call centers	P	P
Accessory uses and structures located on the same site as a conditional use	C	C
Warehousing and distribution facilities	P	
Manufacturing, repair, assembly, or packaging of products from previously prepared materials, such as cloth, plastic, leather, or semi-precious metals or stones, but not including such operations as saw or planing mills, any manufacturing involving primary production of wood, metal, or chemical products from raw materials	P	
Manufacture of food products, pharmaceuticals, biotechnology products and the like, but not including fish or meat products, sauerkraut, vinegar, or the like, or rendering or refining of fats and oils.	P	
Laboratories, including chemical, physical materials testing, electronic, agricultural, photographic film processing, and general research	P	
Electrical industrial apparatus manufacturing, service, and repairs, including motors, generators, welding equipment, electrical transmission and distribution equipment, and turbines and pumps.	P	
Manufacture, repair of optical electronic, timing, and measuring instruments	P	
Dairy products plants	P	
Machine shops	P	
Heating, plumbing, and ventilating equipment manufacturing, servicing, repairs	P	
Refrigerator, furnace, water heater, and other household appliance manufacturing, service and repairs, not incidental to retail sales	P	

Furniture and cabinet assembling whose activities are carried on entirely within an enclosed building and which have no construction yards on the lot	P	
Parcel delivery service and vehicle storage inside and outside the building	P	
Truck terminals	P	
Mini storage	P	
Equipment storage	P	
Janitorial services and supplies	P	
Printing, including lithographing, engraving, and other such similar reproduction services	P	
Automotive supply stores	C	
Rental yards, including the rental of hand tools, garden tools, power tools, trucks, trailers, and other similar equipment	C	
Building materials sales, lumberyards (outside storage)	C	
Repair, painting, and body work for automotive, motorcycle, and farm machinery	C	
Boat sales, service, repair	C	
Service stations, provided all operations except sales of gas and oil are conducted within an enclosed building. Sales shall be limited to petroleum products and automotive accessories, and retail products typically found in a convenience store.	C	
Wholesale trade business	C	
Intermediate manufacturing uses involving the processing of raw materials, including food and paper processing, wineries, and concrete mixers	C	
Mineral and hydrocarbon extraction	C	
Recycling (collection and sorting)	C	
Outlet stores and centers		P
Warehouse retail, including furniture, office supply, sporting goods, or wholesale merchandising		P
Hardware stores, including garden centers		P
Home improvement and interior decorating stores, including carpet, drapery, floor covering, paint, glass, and wallpaper shops		P
Garden centers, including plant nurseries and retail sales		P
Sporting goods and toy stores		P
Specialty retail stores selling those items and services normally sold in department stores (including clothing, shoes, and accessories)		P
Shoe and clothing repair		P
Food markets, convenience markets		P
Liquor stores		P
Drug stores and prescription pharmacies		P
Restaurants, including fast food		P

Art galleries and artists supply stores		P
Barbershops, beauty shops, and hairstylists		P
Financial institutions, including banks, savings and loan offices, finance companies, credit unions, and related services		P
Refrigerator, furnace, water heater, and other household appliance sales including repair, provided repair services are incidental to retail sales.		P
Laundries and dry cleaners		P
Photocopying and related duplicating services, not including printing, lithographing, engraving, or such similar reproduction services		P
Pet and bird stores with incidental veterinary services		P
Animal Shelters		P
Video stores, sales, and rental		P
Automobile and motorcycle sales and rental, including new and used sales		C
Bars without significant food service		C
Building materials sales (no outside storage)		C
Miniature golf		C
Service stations, provided all operations except sales of gas and oil are conducted within an enclosed building. Sales shall be limited to petroleum products and automotive accessories, and retail products typically found in a convenience store.		C

●: Subject to compliance with the Environmental Performance Standards. Note that as defined by State law, any business using significant quantities of hazardous materials requires a Conditional Use Permit.

◊: Existing dairy operations are exempt from the Environmental Performance Standards.

Re: Tracy Alliance Project: Enhanced Design Features

Dear Bill and Victoria:

This letter is sent on behalf of our client, Dermody Properties (Tracy Alliance Group), which is a co-applicant with Suvik Farms, LLC (Suvik) and the Zuriakat Group (Zuriakat), for the Tracy Alliance project (Project).

Brief Project Background.

By way of brief background, the Project would develop up to a total of three million three hundred fifty-two thousand three hundred twenty (3,352,320) square feet of manufacturing, warehouse and distribution uses and related on- and off-site improvements. The overall purpose of the Project is to provide high-quality buildings to attract Class A manufacturing and other light industrial businesses to the Tracy community and to provide local employment opportunities. The Project will be located on a total of approximately 191 acres, located at the northeast corner of Grant Line Road and Paradise Road (collectively, Project Site). The Project Site is within unincorporated San Joaquin County adjacent to the City's northeastern municipal limits and the City's Northeast Industrial (NEI) Specific Plan (NEI Specific Plan) area.

The Project Applicants Are Committed To Incorporating Additional Enhanced Design Features In Addition To Satisfying CEQA Mitigation Measures That Were Identified During A Comprehensive CEQA Process.

As documented at length in the EIR, the Project has been subject to robust environmental review for more than three years; this CEQA process has analyzed, disclosed and mitigated to the extent feasible all significant impacts, including those

associated with air quality, greenhouse gas (GHG) emissions, and transportation impacts (see, e.g., Column 1 of attached Exhibit 1, for Air Quality Mitigation Measures).

In an effort to continue to address in good faith concerns raised by certain members of the public – *and although not required to do so for purposes of CEQA or otherwise* – the Project applicants voluntarily agreed to incorporate additional design features for the City Council's consideration at its August 15th hearing. These features are set forth in detail in Column 2 of attached Exhibit 1.

Furthermore, after receiving direction from several Council members at the August 15th hearing, the Project applicants have continued to diligently and in good faith explore additional enhanced features. These new additional measures, coupled with some proposed refinements to previously proposed features, are detailed in Column 3 of attached Exhibit 1.

As is evident in the attached materials and as otherwise discussed at length throughout the process, the Project applicants are committed to going "above and beyond" in terms of their delivery of a state-of-the-art industrial project that promotes numerous "good neighbor," sustainability and energy conservation policies and incorporates various enhanced features, such as, among others:

- Limiting building size to a maximum of 75,000 sf within 400 feet of eastern property line.
- Facilitating the installation of a community solar array if accepted into the Community Solar Program created under Assembly Bill 2316 (2023).
- Requiring tenants to utilize East Bay Community Energy, a renewable source of energy.
- Installing conduit to facilitate future EV charging stations for HHD trucks and install EV charging stations for passenger vehicles in excess of the number required under applicable standards.
- Working with the City to help secure alternative energy funds through grant programs, including committing to funding up to $50,000 to support these efforts.
- Installing sensitive design and buffering with respect to loading docks.
- Prohibiting cold storage uses and transport refrigeration units (TRUs).
- Incorporating LEED building standards.

- Incorporating numerous design elements to help ensure efficient traffic circulation patterns.

Other Substantial And Numerous Benefits Amply Justify City's Approval Of The Project.

On November 7, 2023, the City Council will consider and take action on the Project (including the necessary legislative entitlements consisting of a specific plan amendment to include the Project Site within the NEI Specific Plan boundaries and related prezoning as well as approval to initiate annexation proceedings). In addition to the substantial number of enhanced features and measures summarized above and detailed in Exhibit 1, the City's rationale to approve the Project is well-founded given its other numerous and significant benefits, including:

- The Project Site will be included as part of the NEI Specific Plan, which is in the northeastern sector of Tracy that has been identified for industrial growth. With direct access to Interstate 205 (I-205) and rail transportation, the Project Site (and the remaining portions of the NEI Specific Plan area) are ideally situated to attract and support businesses without the need for major infrastructure expenditures, and result in the siting of industrial uses in proximity to other similar uses and appropriately distanced and buffered from sensitive receptors. This enables City to facilitate goals of economic development and employment generation, while also helping to ensure the availability of lands in other locations in Tracy for non-industrial uses; this encourages an appropriately diverse and balanced approach to land use consistent with City's General Plan.

- Development of the Project will employ approximately 1,871 people creating local and regional employment opportunities that improve the jobs-to-housing ratio and expand economic opportunities in the Tracy community.

- The Project will create a substantial number of temporary and permanent jobs during both construction and operation and assist in fulfilling City's priorities for future growth anticipated by the Tracy General Plan.

- At buildout, the Project will generate significant tax revenue for the benefit of the Tracy community.

- The location of the Project will provide a high level of accessibility and reduce the commute for local residents, promoting the planned, orderly, efficient development of the area.

- The Project will provide an efficient circulation system and facilitate a future planned interchange at Paradise Road and I-205 through the reservation of land for the southeast quadrant of the planned interchange.

- The Project will improve mobility and provide bicycle and pedestrian connections by constructing a Class I bicycle path to accommodate both pedestrians and bicycles pursuant to City's Transportation Master Plan for both Grant Line Road and Paradise Road. These connections will ultimately provide access to the nearest transit facility, thereby improving access to alternative modes of transportation.

- The Project will maximize the utility of its location and infrastructure to develop industrial uses in a manner that will promote land use patterns that reduce the number and length of motor vehicle trips and reduce vehicle miles traveled (VMT) impacts consistent with City's planned industrial vision.

****

In conclusion, the Tracy Alliance Group and other Project applicants remain committed to delivering a thoughtfully designed, state-of-the-art, high quality industrial project that meets and exceeds the City's expectations. To that end, they are committed to incorporating the enhanced measures set forth herein as part of all phases of the Project's development and operation during the life of the Project. We look forward to further presenting this information to the Council for its consideration on November 7th.

Very truly yours,

MILLER STARR REGALIA

D	MM AIR-1d: Clean Truck Fleet	---	---	---	---

E	MM AIR-1e: Operational Truck Fleet Routing	**COA No. 8: Signage and Traffic Patterns** A. Entry gates into the loading dock/truck court area shall be positioned after seventy (70) feet or more of total available stacking depth inside the property line. B. The proposed project shall be designed to provide adequate on-site parking for commercial trucks and passenger vehicles pursuant to applicable City parking requirements, and onsite queuing for trucks that is away from sensitive receptors to the extent feasible. C. Unless not physically feasible, truck entries shall be located on Collector Streets, and vehicle entries shall be designed to prevent truck access on streets that are not Collector Streets. (Collector Streets = Thru, Local, STAA Truck Routes). D. Anti-idling signs indicating a 3-minute diesel truck engine idling restriction shall be posted at the project facilities along entrances to the project site and in the dock areas. E. Prior to issuance of the certificate of occupancy for each building, the relevant facility operator shall establish and submit for approval to the Planning Director a Truck Routing Plan to and from the State Highway System based on the City's latest Truck Route Map. F. Facility operators shall post signs in prominent locations inside and outside of each building indicating that off-site parking for any employee, truck, or other operation related vehicle is strictly prohibited. G. Signs shall be installed at all truck exit driveways directing truck drivers to the truck route as indicated in the Truck Routing Plan and State Highway System. H. If a project building is greater than 400,000 square feet, the subject building shall include a truck operator lounge equipped with clean and accessible amenities such as restrooms, vending machines, television, and air conditioning.	**PDF No. 8: Signage and Traffic Patterns** A. Entry gates into the Project's loading dock/truck court area(s), as shown on plans submitted to City in connection with each individual development proposal's Development Review Permit process, shall be positioned ~~after~~ such that there is seventy (70) feet or more of total available stacking depth inside the property line. B. ~~The proposed project shall be designed to provide adequate on-site parking for commercial trucks and passenger vehicles pursuant to applicable City parking requirements, and~~ Onsite queuing for trucks ~~that is away from sensitive receptors~~ shall, to the extent feasible, be located at least 100 feet from sensitive receptors. C. Unless not ~~physically~~ feasible as a result of physical site constraints, truck entries shall be located on Collector Streets, and vehicle entries shall be designed to prevent truck access on streets that are not Collector Streets. (Collector Streets = Thru, Local, STAA Truck Routes). D. Anti-idling signs indicating a 3-minute diesel truck engine idling restriction shall be posted ~~at the project facilities~~ along entrances to the project site and in the dock areas. E. Prior to issuance of the certificate of occupancy for each building, the relevant facility operator shall establish and submit for approval to the Planning Director a Truck Routing Plan ("Truck Routing Plan") to and from the State Highway System based on the City's latest Truck Route Map. F. Facility operators shall post signs in prominent locations inside and outside of each building indicating that off-site parking for any employee, truck, or other operation related vehicle is strictly prohibited. G. Signs shall be installed at all truck exit driveways directing truck drivers to the truck route as indicated in the Truck Routing Plan and State Highway System. H. If a project building is greater than 400,000 square feet, the subject building shall include a truck operator lounge equipped with clean and accessible amenities such as restrooms, vending machines, television, and air conditioning.	**EDITS to PDF No. 8: Signage and Traffic Patterns Following 8/15 Hearing** 8A. Strengthened and clarified text. 8B. Provided specific information to further clarify obligation. 8C. Strengthened and clarified text. 8D. Clarified text to further delineate scope of obligation. 8E. Provided specific reference to "Truck Routing Plan" to clarify scope of obligation.	**Compliance Verification** Prior to issuance of building permits (for 8A through 8D, 8G, and 8H); and prior to issuance of certificate of occupancy (for items 8E and 8F), the City shall review Truck Routing Plans, parking plans, and other architectural site plans.
F	MM AIR-1f: Idling Limitation	---	---	---	---
G	MM AIR-1g: Electric On-Site Off-Road and On-Road Equipment	---	---	---	---

H	MM AIR-1h: Vegetated Project Site Buffer	**COA No. 7: Buffers** A. If a project building is less than 50,000 square feet, then a 10-foot wide landscaping buffer shall be provided, measured from the subject building to the property line of all adjacent sensitive receptors. Buffer areas shall include, at a minimum, a solid decorative wall(s) of 10 feet or more in height, natural ground landscaping, and solid screen buffering trees, unless there is an existing solid block wall. Trees used for this purpose shall be evergreen, drought tolerant, minimum 36-inch box, and shall be spaced at 40 feet on center. B. If a project building is 50,000 square feet or more, then a 20-foot wide landscaping buffer shall be provided, measured from the subject building to the property line of all adjacent sensitive receptors. Buffer areas shall include, at a minimum, a solid decorative wall(s) of 10 feet or more in height, natural ground landscaping, and solid screen buffering trees, unless there is an existing solid block wall. Trees used for this purpose shall be evergreen, drought tolerant, minimum 36-inch box, and shall be spaced at 40 feet on center. C. Trees shall be installed in automobile parking areas to provide at least thirty five percent (35%) shade cover of parking areas within 15 years. D. All landscaping shall be drought tolerant, and to the extent feasible, species with low biogenic emissions. Palm trees shall not be utilized. E. All landscaping areas shall be properly irrigated for the life of the facility to allow for plants and trees to maintain growth. F. Loading docks and truck entries shall be oriented away from abutting sensitive receptors, to the extent feasible. If a project building is more than 400,000 square feet, the subject building's loading docks shall be located a minimum of 300 feet away, measured from the property line of the sensitive receptor to the nearest dock door which does not exclusively serve electric, natural gas or hydrogen gas trucks using a direct straight-line method.	**PDF No. 7: Buffers** A. If a project building is less than 50,000 square feet, then a 10-foot wide landscaping buffer shall be provided, measured from the subject building to the property line of all adjacent sensitive receptors. Buffer areas shall include, at a minimum, a berm and/or solid decorative wall(s) totaling ~~of~~ 10 feet or more in height, natural ground landscaping, and solid screen buffering trees, unless there is an existing solid building wall. Trees used for this purpose shall be evergreen, drought tolerant, minimum 36-inch box, and shall be spaced at 40 feet on center. B. If a project building is 50,000 square feet or more, then a 20-foot wide landscaping buffer shall be provided, measured from the subject building to the property line of all adjacent sensitive receptors. Buffer areas shall include, at a minimum, a berm and/or solid decorative wall(s) totaling ~~of~~ 10 feet or more in height, natural ground landscaping, and solid screen buffering trees, unless there is an existing solid building wall. Trees used for this purpose shall be evergreen, drought tolerant, minimum 36-inch box, and shall be spaced at 40 feet on center. C. Trees shall be installed in automobile parking areas to provide at least thirty five percent (35%) shade cover of parking areas within 15 years. D. All landscaping shall be drought tolerant, and to the extent feasible, species with low biogenic emissions. Palm trees shall ~~not be utilized~~ be prohibited. E. All landscaping areas shall be properly irrigated for the life of the facility to reasonably allow for plants and trees to achieve and maintain anticipated growth, subject to applicable laws and regulations governing landscape irrigation. F. Loading docks and truck entries shall be oriented away from abutting sensitive receptors, to the extent feasible. If a project building is more than 400,000 square feet, the subject building's loading docks shall be located a minimum of 300 feet away, measured from the property line of the sensitive receptor to the nearest dock door which does not exclusively serve electric, natural gas or hydrogen gas trucks using a direct straight-line method. G. No building within four hundred (400) feet of the eastern property line of the Project Site shall be larger than seventy-five thousand (75,000) square feet. Any dock doors serving the foregoing buildings on the Suvik Parcel shall be located on the western side of these buildings. Any dock doors serving the foregoing buildings on the Zuriakat Parcel shall be located on the opposing side of these buildings from California Avenue.	**EDITS to PDF No. 7: Buffers Following 8/15 Hearing** 7A. Added clarifying edits. 7B. Added clarifying edits. 7D. Strengthened text. 7E. Added legal clarity. 7G. **New Commitment**. Limits building size to a maximum of 75,000 sf within 400 feet of eastern property line.	**Compliance Verification** Prior to issuance of construction permits, City shall review landscaping plans and other architectural site plans of each individual development proposal for compliance to PDF No .7, items A through G.

No Change to Project Design Feature Following 8/15 Hearing	**Compliance Verification** Throughout all project operations, inspect the presence of at least two food truck vendors serving the project.
N	No Specific Mitigation Measure Identified	**COA No. 9: Alternative Energy** A. Each developer of an individual specific development proposal shall prepare the subject building structures to accommodate future solar panels pursuant to applicable Building Code requirements. B. The office portion of a building's rooftop that is not covered with solar panels or other utilities shall be constructed with light colored roofing material with a solar reflective index of not less than 78. C. Each developer of an individual specific development proposal shall apply to participate in the State of California's Community Solar Program (AB 2316). Said application shall be submitted within 30 days of the subject proposal's opportunity and readiness to apply. Readiness shall be defined to mean all approvals for the subject proposal have been obtained, the subject structure(s) have been built and occupancy permit have been issued. Provided, however, If (a) any such application for a governmental approval or utility approval is rejected; (b) any governmental agency revokes a permit, license, or approval that is required to construct or operate the Solar Facilities on the subject premises; (c) any governmental approval or utility approval issued contains an unreasonable term or condition or is canceled, expires, lapses, or is otherwise withdrawn or terminated; (d) PG&E has not provided authority to interconnect from the utility; (e) the subject Solar Developer determines, in its reasonable and good faith discretion, that the compensation awarded by the California Public Utilities Commission (CPUC) is insufficient to support the construction and operation of the subject Solar Facility; or (f) the subject Solar Developer determines, in its reasonable and good faith discretion, that the cost for construction of the Solar Facility is not economically feasible despite any compensation awarded by the CPUC, the subject Developer shall notify City in writing of Developer's plans to reapply once to the State of California Community Solar Program. D. At least five percent (5%) of all passenger vehicle parking spaces shall be equipped with working Level 2 Quick charge EV charging stations installed and operational, prior to issuance of the certificate of occupancy for the subject building. E. Bicycle racks shall be provided in connection with each specific individual development proposal pursuant to applicable City requirements for warehouse uses by Table 30-714 of the Zoning and Development Code.	**<u>PDF</u> No. 9: Alternative Energy** A. Each developer of an individual specific development proposal shall prepare the subject building structures to accommodate future solar panels pursuant to applicable Building Code requirements. B. The office portion of a building's rooftop that is not covered with solar panels or other utilities shall be constructed with light colored roofing material with a solar reflective index of not less than 78. ~~C. Each developer of an individual specific development proposal shall apply to participate in the State of California's Community Solar Program (AB 2316). Said application shall be submitted within 30 days of the subject proposal's opportunity and readiness to apply. Readiness shall be defined to mean all approvals for the subject proposal have been obtained, the subject structure(s) have been built and occupancy permit have been issued. Provided, however, If (a) any such application for a governmental approval or utility approval is rejected; (b) any governmental agency revokes a permit, license, or approval that is required to construct or operate the Solar Facilities on the subject premises; (c) any governmental approval or utility approval issued contains an unreasonable term or condition or is canceled, expires, lapses, or is otherwise withdrawn or terminated; (d) PG&E has not provided authority to interconnect from the utility; (e) the subject Solar Developer determines, in its reasonable and good faith discretion, that the compensation awarded by the California Public Utilities Commission (CPUC) is insufficient to support the construction and operation of the subject Solar Facility; or (f) the subject Solar Developer determines, in its reasonable and good faith discretion, that the cost for construction of the Solar Facility is not economically feasible despite any compensation awarded by the CPUC, the subject Developer shall notify City in writing of Developer's plans to reapply once to the State of California Community Solar Program.~~ C. <u>As soon as reasonably practicable, after the State of California allows formal submittal of applications tied to the California's Community Solar Program, each developer shall apply for entry into California's Community Solar Program and provide evidence to the Community Development Director of such submittal. If allowed by law, after the Community Solar program sells 51% of its power to low-income residents in Tracy, the building owner or solar producer may allocate a percentage of the building's remaining Community Solar power to</u>	**EDITS to PDF No. 9: Alternative Energy Following 8/15 Hearing** 9C. Edited to provide clarity of implementation of overall solar program. 9D. **<u>New Commitment</u>**. Requires tenants to utilize East Bay Community Energy, a renewable source of energy. 9E. Clarifying language added to facilitate implementation. 9F. **<u>New Commitment.</u>** Provides for a further increase in Electric Vehicle charging stations. 9G. Minor edit. 9H. **<u>New Commitment</u>**. Work with City to help secure alternative energy funds through grant programs.	**Compliance Verification** Prior to issuance of building permits for 9A, 9B, and 9E through 9G, City shall review architectural site plans for each individual specific development for compliance with PDF No. 9 items, listed above. For item 9C and 9D, the Applicant(s) shall provide evidence of the subject submittals to the Community Development Director.

		The racks shall include locks as well as electric plugs, and shall be located as close as feasible to employee entrances.	occupants of the subject buildings. If the formal submittal is denied by the State of California, one additional good faith effort to re-apply shall be attempted. If accepted or denied twice, this measure is considered satisfied as it relates to California's Community Solar program. D. Each developer shall include a provision in each lease that requires each tenant to purchase clean power from East Bay Community Energy. E. At least five percent (5%) of all passenger vehicle parking spaces shown on the subject specific individual development proposal shall be equipped with working Level 2 Quick charge EV charging stations installed and operational, prior to issuance of the certificate of occupancy for the subject building(s). F. Each specific individual development proposal shall exceed the required number of Electric Vehicle charging stations per code by an additional 5%, if meeting the Tier 2 requirements. The increase shall be 10% if meeting the Tier 1 requirements. G. Bicycle racks shall be provided in connection with each specific individual development proposal pursuant to applicable City requirements for warehouse uses by Table 30-714 of the Zoning and Development Code. The racks shall include ~~locks as well as~~ electric plugs~~,~~ and shall be located as close as feasible to employee entrances. H. Each developer of an individual specific development proposal shall support the City's efforts to pursue grant programs for alternative energy programs by taking the following steps: participate with the City in identifying and applying for grant programs for alternative energy programs, including, but not limited to hydrogen fuel and natural gas programs by contributing funding to retain a qualified consultant who specializes in identifying and applying for same, in an amount not to exceed Fifty Thousand Dollars ($50,000).		
O	No Specific Mitigation Measure Identified	**COA No. 10. Operation and Construction** A. Cool surface treatments shall be added to all truck courts or such areas shall be constructed with a solar-reflective cool pavement such as concrete. B. Either a secondary electrical room shall be provided in each building, or the primary electrical room shall be sized twenty five percent (25%) larger than is required to satisfy the service requirements of the subject building or the electrical gear shall be installed with the initial construction with twenty five percent (25%) excess demand capacity for the subject building. C. Each building operator shall incorporate a recycling program pursuant to applicable City requirements. The following environmentally responsible practices shall be required during construction of each specific individual development proposal:	**PDF No. 10. Operation and Construction** ~~A. Cool surface treatments shall be added to all truck courts or such areas shall be constructed with a solar-reflective cool pavement such as concrete.~~ A. Either a secondary electrical room shall be provided in each building, or the primary electrical room shall be sized twenty five percent (25%) larger than is required to satisfy the service requirements of the subject building or the electrical gear shall be installed with the initial construction with twenty five percent (25%) excess demand capacity for the subject building. B. Each building operator shall incorporate a recycling program pursuant to applicable City requirements. The following environmentally responsible practices shall be required during construction of each specific individual development proposal:	**EDITS to PDF No. 10: Operations and Construction Following 8/15 Hearing** 10A. This measure was technically introduced on a southern California project, which uses asphalt and concrete differently than in northern California. Concrete is a limited resource in northern California. As a result, this measure has not	**Compliance Verification** Prior to issuance of building permits, review each individual specific development's recycling program, architectural site plans, environmentally responsible business practices, a Property Maintenance Program, and enrollment into the United States Environmental Protection Agency's SmartWay Program.

		1. The relevant applicant shall use reasonable and good faith efforts to deploy the highest rated CARB Tier technology that is available at the time of construction of the subject proposal. Prior to building permit issuance for the subject proposal, the construction contractor shall submit an equipment list confirming the relevant equipment used is compliant with the highest CARB Tier reasonably available at the time of construction. 2. Only electric-powered hand tools, forklifts, and pressure washers shall be used during construction. 3. There shall be an area designed in the relevant construction site where electric-powered construction vehicles and equipment can charge. D. To facilitate the installation of future electric vehicle charging stations for heavy-heavy duty (HHD) trucks, in connection with each individual development proposal, the subject building improvement plans shall identify an area for future HHD truck charging stations and the subject developer shall install conduit from the power source to the identified area. E. A Property Maintenance Program to address routine site maintenance during project operations (e.g., sweeping of truck/bay areas, litter removal, etc.) shall be submitted for review and approval by the Planning Director or his/her designee prior to the issuance of the building permit for vertical construction of each project building. F. Prior to issuance of the certificate of occupancy for each project building, the relevant property owner shall provide the relevant facility operator with reasonably available information on any incentive programs relating to energy efficiency, and shall require the relevant facility operator to enroll in the United States Environmental Protection Agency's SmartWay Program.	1. The relevant applicant shall use reasonable and good faith efforts to deploy the highest rated CARB Tier technology that is reasonably available at the time of construction of the subject specific individual development proposal. Table of Contents

Acronyms and Abbreviations xi

Executive Summary ES-1
Purpose ES-1
Project Summary ES-1
Significant Unavoidable Adverse Impacts ES-3
Summary of Project Alternatives ES-5
Areas of Controversy ES-6
Public Review of the Draft EIR ES-7
Executive Summary Matrix ES-8

Chapter 1: Introduction 1-1
1.1 - Project Overview 1-1
1.2 - Environmental Review Process 1-2
1.3 - Purpose and Legal Authority 1-4
1.4 - Draft EIR Document Organization 1-8
1.5 - Documents Incorporated by Reference 1-11

Chapter 2: Project Description 2-1
2.1 - Overview 2-1
2.2 - Project Location and Setting 2-2
2.3 - Project Objectives 2-5
2.4 - Project Components 2-5
2.5 - Required Actions and Approvals 2-18
2.6 - Intended Uses of This Draft EIR 2-19

Chapter 3: Environmental Impact Analysis 3-1
Environmental Topics Addressed in this Draft EIR 3-1
Format of the Environmental Analysis 3-1
3.1 - Aesthetics 3.1-1
3.2 - Agriculture and Forestry Resources 3.2-1
3.3 - Air Quality 3.3-1
3.4 - Biological Resources 3.4-1
3.5 - Cultural Resources 3.5-1
3.6 - Energy 3.6-1
3.7 - Geology and Soils 3.7-1
3.8 - Greenhouse Gas Emissions 3.8-1
3.9 - Hazards and Hazardous Materials 3.9-1
3.10 - Hydrology and Water Quality 3.10-1
3.11 - Land Use and Planning 3.11-1
3.12 - Noise 3.12-1
3.13 - Public Services 3.13-1
3.14 - Transportation 3.14-1
3.15 - Tribal Cultural Resources 3.15-1
3.16 - Utilities and Service Systems 3.16-1
3.17 - Wildfire 3.17-1

Chapter 4: Effects Found not to be Significant 4-1
4.1 - Introduction 4-1
4.2 - Environmental Effects Found not to be Significant 4-1

Chapter 5: Other CEQA Considerations 5-1
5.1 - Significant Unavoidable Impacts 5-1
5.2 - Growth-inducing Impacts 5-3
5.3 - Significant Irreversible Environmental Changes 5-4

Chapter 6: Alternatives to the Proposed Project 6-1
6.1 - Introduction 6-1
6.2 - Significant Unavoidable Impacts 6-1
6.3 - Alternative Eliminated from Further Consideration 6-4
6.4 - Alternatives to the Proposed Project 6-5
6.5 - Project Objectives 6-6
6.6 - Alternative 1—No-Project Alternative 6-7
6.7 - Alternative 2—Outside Storage Allowable Use Alternative 6-12
6.8 - Alternative 3—Agricultural Protection Alternative 6-19
6.9 - Environmentally Superior Alternative 6-25

Section 7: Persons and Organizations Consulted/List of Preparers 7-1
7.1 - Persons and Organizations Consulted 7-1
7.2 - Project Sponsor and Sponsor Consultants 7-2
7.3 - City of Tracy Consultants 7-2

List of Appendices

Appendix A: Environmental Impact Report Public Involvement

Appendix B: Air Quality and Greenhouse Gas Emissions Supporting Information

Appendix C: Biological Resources Supporting Information
C.1 - Biological Resources Assessment

Appendix D: Cultural and Tribal Cultural Resources Supporting Information
D.1 - Cultural Resources Assessment

Appendix E: Energy Supporting Information

Appendix F: Geology and Soils Supporting Information
F.1 - Geotechnical Engineering Report
F.2 - Paleontological Records Search

Appendix G: Hazards and Hazardous Materials Supporting Information
G.1 - Phase I Environmental Site Assessment–Tracy Alliance Parcels
G.2 - Limited Site Investigation Tracy Alliance Parcels
G.3 - Phase I Environmental Site Assessment Suvik Farms and Zuriakat Parcels

Appendix H: Hydrology and Water Quality Supporting Information
H.1 - Flood Protection Technical Memorandum
H.2 - Hydrology Report

Appendix I: Noise Supporting Information

Appendix J: Transportation Supporting Information
J.1 - Tracy Alliance Project Vehicle Miles Traveled Analysis Memorandum
J.2 - Transportation Impact Analysis

Appendix K: Utilities Supporting Information
K.1 - Water Supply Assessment

EXECUTIVE SUMMARY

Purpose

This Draft Environmental Impact Report (Draft EIR) is prepared in accordance with the California Environmental Quality Act (CEQA) to evaluate the potential environmental impacts associated with the implementation of the Tracy Alliance Project (State Clearinghouse No. 2020080524). This document is prepared in conformance with CEQA (California Public Resources Code, Section 21000, et seq.) and the CEQA Guidelines (California Code of Regulations, Title 14, Section 15000, et seq.).

The purpose of this Draft EIR is to inform decision makers, representatives of trustee and responsible agencies, the public, and other interested organizations of the potential environmental effects that may result from implementation of the Tracy Alliance Project (proposed project). This Draft EIR describes potential impacts relating to a wide variety of environmental issues and methods by which these impacts can be feasibly mitigated or avoided.

Project Summary

Project Location

The project site is located at the northeast corner of Grant Line Road and Paradise Road (see Exhibit 2-2). The site is within unincorporated San Joaquin County land, adjacent to the northeastern city limits and within the City of Tracy's Sphere of Influence (SOI). The project site is directly east of the City's NEI Specific Plan boundary. The site is bound by I-205 to the north, California Avenue to the northeast, Grant Line Road to the south, and Paradise Road to the west.

Project Description

The proposed project consists of the development of up to 3,352,320 square feet of warehouse and distribution and related uses on a total of approximately 191.18 acres. The site consists of six parcels under ownership by three separate parties: the Tracy Alliance Group owns two parcels (totaling approx. 122.44 acres), Suvik Farms, LLC owns three parcels (totaling approx. 46.61 acres), and Zuriakat owns one parcel (approx. 22.17 acres).

Development on the Tracy Alliance parcels would consist of approximately 1,849,500 square feet of warehouse and distribution space located in three buildings (Building A, Building B, and Building C), as well as an approximately 12.44-acre stormwater basin with pump station that would be City-owned and managed. Approximately 12.51 acres of the Tracy Alliance land would be reserved to accommodate a portion of a planned interchange at Paradise Road and Interstate 205 (I-205). However, the potential impacts of constructing this future interchange would undergo a separate environmental review process pursuant to the CEQA and National Environmental Policy Act (NEPA), once funding is programmed and available and once the ultimate design of the interchange is finalized; accordingly, the construction of the interchange is not considered part of the proposed project. In addition to the proposed development on the Tracy Alliance parcels, the Suvik Farms Parcel and Zuriakat Parcel would both be developed with light industrial uses. The Suvik Farm Parcel

would have a maximum building square footage of 1,023,660 square feet on a land area of 2,047,320 gross square feet (50 percent Floor Area Ratio [FAR]) and the Zuriakat Parcel would have a maximum building square footage of 479,150 square feet on a land area of 958,320 gross square feet (50 percent FAR). The foregoing assumptions of maximum development capacity are based on the maximum allowable density per acre identified in the NEI Specific Plan.

The proposed project also includes demolition of 11 existing residential and agricultural buildings on approximately four acres located at the southwestern corner of the Tracy Alliance parcels, removal of existing trees and crops, construction of on- and off-site roadway improvements, and grading of approximately 500,000 cubic yards, which would be balanced on-site. Of the 500,000 cubic yards of material graded, approximately 300,000 cubic yards would occur on the Tracy Alliance parcels, approximately 150,000 cubic yards would occur in development of the Suvik Farms parcels, and approximately 50,000 cubic yards would occur in development of the Zuriakat parcel.. The proposed project would include ample landscaping consistent with all applicable City requirements; for example, in connection with the individual development proposal for the Tracy Alliance Parcels, the relevant site plan reflects approximately 110,000 square feet of landscaped areas. The proposed project would also include sufficient on-site parking for both vehicles and trailer spaces consistent with all applicable City requirements; for example, in connection with the individual development proposal for the Tracy Alliance Parcels, the relevant site plan reflects approximately 1,134 automobile parking spaces, and approximately 572 trailer parking spaces.

The proposed project would also include off-site roadway improvements, consisting of a westbound right turn lane at the intersection of Grant Line Road and North MacArthur Drive with a right-turn overlap of the signal phase as well as an additional second westbound left turn lane at the intersection of Chrisman Road and Eleventh Street.

The City of Tracy General Plan designates the project site as Industrial. As discussed more fully in this Draft EIR, the proposed project would be consistent with the planned industrial uses under the City's land use vision for the project site and vicinity. In connection therewith, the co-applicants for the proposed project are seeking an amendment to the Northeast Industrial (NEI) Specific Plan to incorporate the project site into its boundary (as well as any other conforming amendments necessary to ensure consistency). As an employment-generating use, the proposed project is expected to employ approximately 1,871 people.

Chapter 2, Project Description, provides a complete description of the proposed project.

Project Objectives

The quantifiable objectives of the Tracy Alliance Project include the following:

- Development of approximately 167 acres of industrial uses (building and parking areas and related improvements).
- Development of approximately 12.44 acres of public facilities (storm basin).
- Reserve approximately 12.51 acres for future planned interchange at Paradise Road and I-205.

- Build a maximum of 3,352,320 square feet of employment-generating industrial uses.

Additional qualitative objectives for the Tracy Alliance Project are as follows:

- **Employment Opportunities:** Provide for local and regional employment opportunities that take advantage of the project site's high level of accessibility, allow for the expansion of the City's economic base, help improve the jobs/housing balance, and reduce the commute for regional residents.
- **Transportation:** Provide an efficient circulation system, including reserving land for a future planned interchange at Paradise Road and I-205 (construction of the interchange would not be completed as part of the proposed project).
- **Public Facilities and Services:** Provide infrastructure and services to serve the proposed project that meet applicable City standards and integrate with existing and planned facilities.
- **Phasing:** Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet applicable City standards.

Significant Unavoidable Adverse Impacts

The proposed project would result in the following significant unavoidable impacts:

- **Project-Level Conversion of Prime Farmland:** Although the proposed project is consistent with the site's General Plan designation and conversion of the project site to industrial use was envisioned as part of buildout under the General Plan, development consistent with the proposed project would result in the loss of agricultural land and would result in conversion of Prime Farmland to urban uses. The project applicant would be required to pay applicable Agricultural Mitigation Fees in connection with individual development proposals as implemented by Mitigation Measure (MM) AG-1. No other feasible mitigation is available to further reduce this impact. According, even with the payment of fees and adherence to the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP), the proposed project would result in significant and unavoidable impacts related to the conversion of Farmland as identified by Farmland Mapping and Monitoring Program (FMMP) mapping to non-agricultural use.

- **Cumulative Conversion of Prime Farmland:** Much of the Northeast Industrial (NEI) Specific Plan area consists of Prime Farmland that would be converted to non-agricultural uses with implementation of the relevant cumulative projects. Like the proposed project, any of the cumulative projects that would convert Prime Farmland to non-agricultural uses would pay the Agricultural Mitigation Fee. The development of the proposed project would result in the loss of approximately 188 acres of Prime Farmland, which would result in a project-level significant and unavoidable impact, which would also result in a cumulative considerable contribution to the cumulative impact that would be significant and unavoidable.

- **Project-Level Impact Related to Implementation of the Applicable Air Quality Plan:** The proposed project is consistent with the site's General Plan designation which means the

proposed industrial use was accounted for in the Air Quality Plan (AQP) land use projections. However, the proposed project could create a localized violation of State or federal air quality standards, significantly contribute to cumulative non-attainment pollutant violations, and expose sensitive receptors to substantial pollutant concentrations. The proposed project would be required to implement MM AIR-1 through MM AIR-4; however, because full implementation of the mitigation cannot be guaranteed due to potential technical and/or financial infeasibility, the proposed project's potentially significant impact is conservatively identified as significant and unavoidable. Therefore, the proposed project is inconsistent with Criterion 1 of the AQP even after the incorporation of mitigation. The impact would be significant and unavoidable.

- **Project-Level Impact Related to Cumulatively Considerable Net Increase of reactive organic gases (ROG) and carbon monoxide (CO) During Construction, and ROG and oxides of nitrogen (NOX) During Operation:** The construction schedule for the proposed project assumed that none of the three project phases would overlap. In this scenario, after the incorporation of MMs AIR-1a and AIR-1b, construction of the proposed project may not exceed the San Joaquin Valley Air Pollution Control District (Valley Air District) daily emission screening levels for an Ambient Air Quality Analysis (AAQA), pursuant to District Rule 2201. However, the potential remains for project phases to be constructed concurrently. If the three phases of construction occur concurrently, emissions of ROG and CO would exceed the Valley Air District's significance thresholds if all three project phases were constructed concurrently. As such, this impact would remain significant and unavoidable after implementation of identified mitigation.

  During operation, unmitigated emissions would exceed Valley Air District thresholds of significance for ROGs and NO_X. Therefore, MM AIR-1c and MM AIR-1d would be required to mitigate operational emissions to below Valley Air District thresholds. However, the full implementation of MM AIR-1c and MM AIR-1d cannot be guaranteed during project operation; therefore, the reasonable worst-case operational emissions would exceed the Valley Air District's significance thresholds for ROG and NO_X and this impact would remain significant and unavoidable.

- **Project-Level Impact Related to Exposing Sensitive Receptors to Substantial Pollutant Concentrations:** During construction, if all three project phases were constructed concurrently, the proposed project would expose sensitive receptors to CO and diesel particulate matter (DPM) emissions that exceed applicable thresholds even with mitigation incorporated. During operation, the proposed project would expose sensitive receptors to ROGs, NO_X, and DPM levels that exceed applicable thresholds even after incorporation of identified mitigation resulting in a significant and unavoidable impact.

- **Cumulative Air Quality Impact:** The proposed project would exceed the identified construction or operational significance thresholds; therefore, its emissions would also be cumulatively considerable.

- **Project-Level Vehicle Miles Traveled (VMT) Impact:** The proposed project's VMT would result in a significant impact given that the location-based, service-estimated average one-way trip length for automobile trips generated by the proposed project is more than 20 miles, and the proposed project would be in excess of 15 percent threshold required to mitigate VMT impacts. The proposed project would be required to implement MM TRANS-1, which would require the applicant to prepare a project-specific Transportation Demand Management (TDM Program in consultation with the City of Tracy) to reduce project-generated VMT. However, even with incorporation of MM TRANS-1, which would partially reduce VMT impacts, the impact would remain significant and unavoidable.

- **Cumulative VMT Impact:** Cumulative projects would be required to comply with applicable State and local laws and regulations that seek to reduce VMT. If found to result in significant VMT impacts, each cumulative project would be required to implement site-specific TDM measures that would reduce VMT and encourage alternative modes of transportation, such as transit, bicycle use, and walking. Cumulative projects would also be required to include facilities based on future transportation studies prepared for that project and pay into the City's VMT banking program once established. However, even with implementation of all available feasible mitigation, the cumulative VMT would still exceed City standards and would be significant and unavoidable. In addition, as described in Impact TRANS-1, the proposed project's impacts would be significant and unavoidable even with the implementation of mitigation. As such, the proposed project would have a cumulatively considerable contribution to a cumulative impact and in conjunction with other projects, would have a significant and unavoidable impact with respect to VMT. The proposed project's contribution would be cumulatively considerable.

Summary of Project Alternatives

Below is a summary of the alternatives to the proposed project considered in Section 6, Alternatives to the proposed project.

No Project (No Build) Alternative

Under this alternative, development of the project site would not occur, and the project site would remain in its current existing condition.

Outside Storage Allowable Use Alternative The Outside Storage Allowable Use Alternative contemplates a reduction in building square footages, an increase in outside storage areas, and the preservation of 25 percent of the existing agricultural operations (approximately 48 acres). This alternative contemplates a combination of "Equipment Storage Yards," which is a Permitted Use under the NEI Specific Plan and/or "Building Materials Sales, Lumberyards (outside storage)," which is a Conditional Use permitted under the NEI Specific Plan. The project site would be developed in such a way to protect some of the on-site Prime Farmland by reducing the overall footprint of the developed areas. The outside storage uses would require less building coverage and the number of employees would be reduced as compared to the proposed project.

Agricultural Protection Alternative

Under this alternative, the proposed project would be developed in such a way as to protect some of the on-site Prime Farmland by reducing the overall footprint of the developed areas while maintaining a buffer between existing units along California Avenue. The northern half (approximately 11 acres) of the Zuriakat Parcel would remain in agricultural production.

Areas of Controversy

Pursuant to CEQA Guidelines Section 15123(b), a summary section must address areas of controversy known to the lead agency, including issues raised by agencies, other interested organizations, and the public, and it must also identify issues to be resolved, including the choice among alternatives and whether or how to mitigate the significant effects.

A Notice of Preparation (NOP) for the proposed project was issued on August 28, 2020. The NOP describing the proposed project and issues to be addressed in the EIR was distributed to the State Clearinghouse, responsible and trustee agencies, and other interested organizations, and the public for a 30-day public review period extending from August 28, 2020 through September 30, 2020. The NOP identified the potential for significant impacts on the environment related to the following topical areas:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

Disagreement Among Experts

This Draft EIR contains substantial evidence to support all the conclusions presented herein. It is possible that there will be disagreement among various parties regarding these conclusions, although the City of Tracy is not aware of any disputed conclusions at the time of this writing. Both CEQA and case law applying the statutory requirements under CEQA provide the standards for treating disagreement among experts. Where evidence and opinions conflict on an issue concerning the environment, and the lead agency knows of these controversies in advance, the EIR must acknowledge the controversies, summarize the conflicting opinions of the experts, and include sufficient information to allow the public and decision makers to make an informed judgment about the environmental consequences of the proposed project. However, the lead agency retains the discretion to elect to rely on expert(s) retained in connection with the preparation of the EIR and related technical analyses, and a decision to do so should be incorporated into the relevant CEQA findings.

Potentially Controversial Issues

Based on NOP comments, below is a list of potentially controversial issues that may be raised during the public review and hearing process of this Draft EIR:

- There is a potential for the proposed project to result in the release of hazardous wastes/substances. Soil sampling, surveying of buildings that would be demolished for lead, and evaluation of former agricultural lands are recommended.
- The proposed project would be located in Prime Agricultural Land.
- Potential impacts to unknown cultural resources on the project site will need to be evaluated.
- Consistency with the San Joaquin Council of Governments (SJCOG) will need to be evaluated.
- Additional truck traffic could have significant cumulative health effects on nearby sensitive receptors.
- Additional truck traffic could have significant noise impacts on nearby sensitive receptors.
- Additional VMT would affect the surrounding community.
- The proposed project must comply with RWQCB regulations, policies, and permits.
- The proposed project must comply with the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP).

It is also possible that evidence will be presented during the 45-day, statutory Draft EIR public review period that may create disagreement. Decision makers would consider this evidence during the public hearing process.

As noted above, in rendering a decision on a project where there is disagreement among experts, the decision makers are not obligated to select the most environmentally preferable viewpoint. Decision makers are vested with the ability to choose whatever viewpoint is preferable, based on substantial evidence in the record, and need not resolve a dispute among experts. In their proceedings, decision makers must consider comments received concerning the adequacy of the Draft EIR and address any objections raised in these comments. However, decision makers are not obligated to follow any directives, recommendations, or suggestions presented in comments on the Draft EIR, and can certify the Final EIR by choosing to rely on experts retained in connection with the preparation of the EIR without needing to resolve disagreements among experts.

Public Review of the Draft EIR

Upon completion of the Draft EIR, the City of Tracy filed a Notice of Completion (NOC) with the State Office of Planning and Research to begin the public review period (Public Resources Code, Section 21161). Concurrent with the NOC, this Draft EIR has been distributed to responsible and trustee agencies, other affected agencies, surrounding cities, and interested organizations, as well as all parties requesting a copy of the Draft EIR in accordance with Public Resources Code 21092(b)(3). During the public review period, the Draft EIR, including the technical appendices, is available for review at the City of Tracy offices and the Tracy Library. The address for each location is provided below:

City of Tracy
Development Services Department
333 Civic Center Plaza
Hours:
Monday-Thursday: 8:00AM-6:00PM
Friday: 8:00AM-5:00PM

Tracy Branch Library
20 East Eaton Avenue
Tracy, CA 95376

Agencies, interested organizations, and members of the public have the opportunity to comment on the Draft EIR during the 45-day public review period. Written comments on this Draft EIR should be addressed to:

Victoria Lombardo, Senior Planner
Development Services Department
333 Civic Center Plaza
Tracy, CA 95376
Phone: 209.831.6428

Submittal of electronic comments in Microsoft Word or Adobe PDF format is encouraged. Upon completion of the public review period, written responses to all significant environmental issues raised will be prepared and made available for review by the commenting agencies at least 10 days prior to the public hearing before the City of Tracy on the proposed project, at which the certification of the Final EIR will be considered. Comments received and the responses to comments will be included as part of the record for consideration by decision makers for the proposed project.

Executive Summary Matrix

Table ES-1 below summarizes the impacts, mitigation measures, and resulting level of significance after mitigation for the relevant environmental issue areas evaluated for the proposed project. The table is intended to provide an overview; narrative discussions for the issue areas are included in the corresponding section of this EIR. Table ES-1 is included in the EIR as required by CEQA Guidelines Section 15123(b)(1).

Table ES-1: Executive Summary Matrix

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Section 3.1—Aesthetics			
Impact AES-1: The proposed project would not have a substantial adverse effect on a scenic vista.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact AES-2: The proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact AES-3: The proposed project is in an urbanized area. The proposed project would not conflict with applicable zoning and other regulations governing scenic quality.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact AES-4: The proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.2—Agriculture and Forestry Resources			
Impact AG-1: The project would convert Farmland pursuant to the FMMP, to non-agricultural use.	Potentially Significant	**MM AG-1: Payment of Agricultural Mitigation Fees** At the time of issuance of building permits for each individual development proposal, the relevant applicant(s) for the subject development proposal shall pay the applicable Agriculture Mitigation Fee in accordance with Chapter 13.28 of the Municipal Code.	Significant and Unavoidable

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact AG-2: The project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact AG-3: The project would not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production.	No impact	No mitigation is necessary.	No impact
Impact AG-4: The project would not result in the loss of forest land or conversion of forest land to non-forest use.	No impact	No mitigation is necessary.	No impact
Impact AG-5: The project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impact	Potentially Significant Impact	MM AG-1	Significant and Unavoidable
Section 3.3—Air Quality			
Impact AIR-1: The proposed project could conflict with or obstruct implementation of the applicable air quality plan.	Potentially Significant Impact	**MM AIR-1a**: **NO_X Reduction Measures** Prior to the issuance of grading or building permits for each individual development proposal within the project site, the relevant applicant for each development proposal shall provide documentation to the City of Tracy demonstrating the following NO_X reduction measures would be adhered to during construction activities for the relevant development proposal: • For all construction equipment and vehicles used during project construction that are equal to or	Significant and Unavoidable

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		greater than 250 horsepower, the contractor shall use construction equipment and vehicles that meet the United States Environmental Protection Agency (EPA) Tier 4 Final engine standards; • For all construction equipment and vehicles used during project construction that are less than 250 horsepower, the contractor shall use electric construction equipment and vehicles to the extent feasible, with the exception of handheld generator sets; and • All generator sets utilized during project construction shall be limited to 5 horsepower and shall only be used to power handheld power tools. The construction contractor shall maintain reasonable records concerning its efforts to comply with this requirement, including equipment lists. Documentation that each relevant applicant provides to the City shall include, but is not limited to, equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, and engine serial number. **MM AIR-1b: "Super-Compliant" Architectural Coatings** Prior to the issuance of grading or building permits for each individual	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		development proposal within the project site, the relevant applicant for each development shall provide the City with documentation demonstrating the use of "Super-Compliant" architectural coatings, as defined by the South Coast Air Quality Management District (South Coast AQMD), during construction of the proposed project. "Super-Compliant" architectural coatings, as defined by the South Coast AQMD, are paints which do not exceed 10 grams of reactive organic gas (ROG) per liter of paint. **MM AIR-1c**: **"Zero-VOC" Consumer Products** The consumer products purchased by the building occupant(s) or by the cleaning business contracted by the building occupant(s) for on-site use shall consist of water-based or "zero volatile organic compound [VOC]" consumer products, to the maximum extent feasible. "Consumer products," as referred to in this mitigation measure, shall include detergents, cleaning compounds, polishes, and floor finishes. "Consumer products," as referred to in this mitigation measure, shall not include parking lot degreasers, architectural coatings, pesticides, or fertilizers. **MM AIR-1d**: **Clean Truck Fleet** Prior to the issuance of the certificate of occupancy for each individual development proposal within the project	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		site, the relevant applicant for the subject individual development proposal shall provide the City with reasonable documentation demonstrating the use of a clean truck fleet that meets the California Air Resources Board's adopted 2013 Optional Low-NO_X Standard of 0.02 gram of nitrogen oxide (NO_X) per brake horsepower hour for all heavy-duty trucks during operation of the proposed project, to the maximum extent feasible. If the relevant applicant does not own the truck fleet that will be used during operation of the subject individual development, the relevant applicant shall provide the City with reasonable documentation from the truck fleet owner demonstrating that trucks utilized for operation of the subject individual development will meet the California 2013 Optional Low-NO_X Standard, to the maximum extent feasible. If any change occurs where a new truck fleet is utilized during operation of the subject individual development, the relevant applicant shall provide the City with reasonable documentation demonstrating that the new truck fleet meets the California 2013 Optional Low-NO_X Standard of 0.02 gram per brake horsepower hour, to the maximum extent feasible.	
Impact AIR-2: The proposed project could result in a cumulatively considerable net increase of any criteria pollutant for which the region is in nonattainment under an	Potentially Significant	MM AIR-1a through MM AIR-1d	Significant and Unavoidable

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
applicable federal or State ambient air quality standard.			
Impact AIR-3: The proposed project could expose sensitive receptors to substantial pollutant concentrations.	Potentially Significant	MM AIR-1d	Significant and Unavoidable
Impact AIR-4: The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	Less Than Significant	No mitigation is necessary.	Less than Significant
Cumulative Impact	Potentially Significant Impact	MM AIR-1a through MM AIR-1d	Significant and Unavoidable
Section 3.4—Biological Resources			
Impact BIO-1: The project could have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service.	Potentially Significant	**MM BIO-1a: Song Sparrow and Tricolored Blackbird Mitigation** Implementation of the following avoidance and minimization measures would avoid or minimize potential effects to song sparrow and tricolored blackbird as a result of project implementation within the Zuriakat parcel in and adjacent to the project site. These measures shall be implemented for construction work that occurs during the nesting season (February 1 through August 31): • If construction or habitat removal is proposed during the breeding/nesting season (typically February 1 through August 31), a qualified Biologist shall conduct pre-construction surveys for song sparrow and tricolored blackbird within potential nesting habitat of the construction area, (special attention should be paid to the cattail marsh within the Zuriakat parcel) including a	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		500-foot survey buffer for tricolored blackbird and a 75-foot survey buffer for song sparrow, no more than 7 days prior to the start of ground disturbing activities in the construction area. If no active nests are detected within the construction area on the project site or within the relevant buffer survey area, then no additional measures are required. • If an active nest is located during pre-construction surveys, the California Department of Fish and Wildlife (CDFW) (as appropriate) shall be notified (as appropriate) regarding the status of the nest. A setback of 500 feet (for tricolored blackbird) and 75 feet (for song sparrow) shall be established and maintained during the nesting season for the period encompassing nest building and continuing until fledglings leave nests. This setback applies whenever construction or other ground-disturbing activities must begin during the nesting season in the presence of nests which are known to be occupied. Furthermore, construction activities shall be restricted in the construction area as necessary to avoid disturbance of the nest until it is abandoned, or a qualified Biologist deems disturbance potential to be minimal. Restrictions shall include consultation with a qualified Biologist to determine appropriate buffer zones or alteration	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		of the construction schedule in the relevant area. - A qualified Biologist shall delineate the buffer using nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. **MM BIO-1b: Swainson's Hawk Foraging:** Prior to any activities that would result in ground disturbance to the project site, the relevant applicant(s) for the subject development on any portion of the project site shall each ensure coverage of the relevant portion(s) of the project site under the SJMSCP and pay the applicable fee purchase adequate mitigation through the SJMSCP for 140.59 acres of potential foraging habitat (recommended) or alternatively provide applicant-responsible compensatory mitigation at a 1:1 ratio (such as procurement of credits through a mitigation bank or dedicated of a conservation easement). **Nesting:** The following measures shall be implemented for construction work during the nesting season (February 1 through August 31): • Implementation of the following avoidance and minimization measures would avoid or minimize potential	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		effects to Swainson's hawk as a result of project implementation and adjacent to the project site. These measures shall be implemented for construction work that occurs during the nesting season (February 1 through August 31): - If construction or habitat removal is proposed during the breeding/nesting season (typically February 1 through August 31), a qualified Biologist shall conduct pre-construction surveys for Swainson's hawk within the construction area, (special attention should be paid to trees with past recorded occurrences) including a 0.5 mile foot survey buffer, no more than 7 days prior to the start of ground disturbing activities in the construction area. If no active nests are detected within the construction area site or within the buffer survey area, then no additional measures are required. - If active Swainson's hawk nests are found within the construction area or the 0.5 mile survey buffer of the project site, a qualified Biologist shall determine what nest avoidance buffers may be necessary so that construction related activities do not cause nest abandonment.	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		The avoidance buffer shall be submitted to the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) for approval. The qualified Biologist shall monitor construction activities to ensure construction activities do not result in adverse effects to the nest, fledglings, or adults. The Biologist shall submit a memorandum documenting construction compliance to the appropriate agencies. **MM BIO-1c**: **Burrowing Owl** • A qualified Biologist shall conduct a pre-construction survey no later than 30 days prior to commencement of any ground-disturbing construction activities on the construction area. The survey shall be conducted in accordance with the *Staff report on Burrowing Owl Mitigation.*[1] All suitable habitats within the construction area site and adjacent buffer (within 500 feet) shall be surveyed. If no burrowing owl are detected during the surveys, then no additional measures are required. • If pre-construction surveys during the breeding season (February 1- August 31) detect active burrows within the	

[1] California Department of Fish and Wildlife (CDFW). 2012. Staff Report on Burrowing Owl Mitigation. March 7. Website: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=83843&inline=true. Accessed on April 29, 2020.

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		construction area or near the adjacent buffer survey area site, a qualified Biologist shall establish and delineate an appropriate buffer zone around the nest until the breeding season is over as determined by the Biologist. Buffer areas shall be established using the guidelines within the *Staff report on Burrowing Owl Mitigation*. • If pre-construction surveys detect active burrows during the non-breeding season (September 1- January 31) the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) allows for eviction or passive relocation of owls. A passive relocation plan shall be prepared and submitted to SJMSCP for approval. **MM BIO-1d: San Joaquin Kit Fox Measures to protect San Joaquin kit fox shall consist of the following:** • A qualified Biologist shall conduct a pre-construction survey of the construction area and a 200-foot buffer, between 14 and 30 days prior to the commencement of ground disturbance. If the surveys do not identify any San Joaquin kit fox activity or locate any potential dens, then no further measures are necessary. • If the survey identifies potential dens (potential dens are defined as burrows at least 4 inches in diameter that open up within 2 feet), den entrances shall be dusted for 3 calendar days to	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		register track of any San Joaquin kit fox present. If no San Joaquin kit fox activity is identified, potential dens may be destroyed. If San Joaquin kit fox activity is identified, then dens shall be monitored by a qualified Biologist to determine if occupation is by an adult fox only or is a natal den (natal dens usually have multiple openings). • If the den is occupied by an adult only, the den may be destroyed when the adult fox has moved or is temporarily absent. If the den is a natal den, a buffer zone of 250 feet shall be maintained around the den until the Biologist determines that the den has been vacated. Where San Joaquin kit fox are identified, the provisions of the United States Fish and Wildlife Service's published *Standardized Recommendations for Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance*[2] shall apply (except that preconstruction survey protocols shall remain as established in this paragraph). These standards include provisions for educating construction workers regarding the San Joaquin kit fox and keeping heavy equipment operating at safe speeds.	

[2] United States Fish and Wildlife Service (USFWS). 1999. Standardized recommendations for protection of the San Joaquin Kit Fox Prior to or during ground disturbance. Website: https://www.fws.gov/ventura/docs/species/protocols/sjkf/sanjoaquinkitfox_protection.pdf. Accessed April 29, 2020.

		MM BIO-1e: **Migratory Birds** • To prevent significant impacts to Migratory Bird Treaty Act (MBTA)-protected birds, nesting raptors, and their nests, removal of trees shall be limited to only those necessary to feasibly construct the proposed project as shown on the individual development plans approved by the City pursuant to the mapping and/or development review process. • If any tree removal is necessary, then it should occur outside the nesting season between September 1 through January 31 to the extent feasible. If trees cannot feasibly be removed outside the nesting season, preconstruction surveys shall be conducted no more than 7 days prior to tree removal to verify the absence of active nests. • If an active nest is located during pre-construction surveys, the United States Fish and Wildlife Service (USFWS) and/or the California Department of Fish and Wildlife (CDFW) (as appropriate) shall be notified regarding the status of the nest. Construction activities shall be restricted in the construction area as necessary to avoid disturbance of the nest until it is abandoned, or the agencies deem disturbance potential to be minimal. Restrictions shall consist of the include establishment of exclusion zones (no ingress of personnel or equipment at a minimum radius of 100 feet around an	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		active raptor nest and an appropriate radius around an active migratory bird nest depending on the species) or alteration of the construction schedule. • A qualified Biologist shall delineate the buffer using nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. **MM BIO-1f**: **Roosting Bats** • A qualified wildlife Biologist shall conduct surveys for special-status bats during the appropriate time of day to maximize detectability to determine if bat species are roosting near the construction area no less than 7 days and no more than 14 days prior to beginning ground disturbance and/or construction. Survey methodology may include visual surveys of bats (e.g., observation of bats during foraging period), inspection for suitable habitat, bat sign (e.g., guano), or use of ultrasonic detectors (Anabat, etc.). • Visual surveys shall include trees within 0.25 mile of project construction activities. Not more than two weeks prior to building demolition, the Tracy Alliance parcel applicants for development on any project parcel, shall ensure that a qualified Biologist (i.e., one familiar with the identification	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		of bats and signs of bats) survey buildings proposed for demolition for the presence of roosting bats or evidence of bats. If no roosting bats or evidence of bats are found in the structure, demolition may proceed. If the Biologist determines or presumes bats are present (if there are site access issues or structural safety concerns), the Biologist shall exclude the bats from suitable spaces by installing one-way exclusion devices. After the bats vacate the space, the Biologist shall close off the space to prevent recolonization. Building demolition of the subject structure shall only commence after the Biologist verifies seven to 10 days later that the exclusion methods have successfully prevented bats from returning. To avoid significant impacts on non-volant (i.e., nonflying) bats, the Biologist shall only conduct bat exclusion and eviction from May 1 through October 1. Exclusion efforts shall also be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young).	
Impact BIO-2: The proposed project would not have a substantial adverse effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the	Less Than Significant	No mitigation is necessary.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.			
Impact BIO-3: The project could have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	Potentially Significant	**MM BIO-3**: **Conduct Delineation of Potentially Jurisdictional Aquatic Resources (Channels & Wetlands)** The applicant(s) for development on any project parcel shall complete a formal jurisdictional delineation to document and quantify the full extent of potentially jurisdictional waters for the relevant project parcel(s) in coordination with the applicable regulatory agencies. The applicant(s) for development on any project parcel shall also coordinate, to the extent required under applicable laws and regulations, with the applicable regulatory agencies (United States Army Corps of Engineers [USACE], Regional Water Quality Control Board [RWQCB], and/or California Department of Fish and Wildlife [CDFW]) to determine whether the irrigation/drainage channels and/or cattail marsh on the project site is protected under Section 404 and 401 of the Clean Water Act (CWA) and/or Section 1602 of the California Fish and Game Code. **Obtain CWA Sections 401 and 404 Permits Prior to Construction** • Prior to the fill of any potentially jurisdictional waters within the project site, the relevant project applicant(s) for the subject project parcel(s) shall consult with the USACE and Regional	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Water Quality Control Board, to the extent required under applicable laws and regulations, to determine the extent, if at all, that waters of the United States and State may be impacted by the proposed project. • If required, the relevant applicant(s) for development of the subject project parcel(s) shall obtain a Section 404 CWA permit for impacts to waters of the United States. That same applicant, for development of the subject project parcel(s), will also obtain a Section 401 Water Quality Certification from the RWQCB, if required. Any such required permit and certification shall be obtained prior to issuance of grading permits for the implementation of the individual development proposal on the subject project parcel(s). • The applicant(s) for development on any project parcel shall design the project to result in no net loss of functions and values of waters of the United States and State by incorporating impact avoidance, impact minimization, and/or compensatory mitigation for the impact, as set forth in the subject Section 404 permit and 401 water quality certification. • Compensatory mitigation may consist of (1) obtaining credits from a mitigation bank; (2) making a payment to an in-lieu fee program that would conduct wetland, stream, or other aquatic resource restoration, creation,	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		enhancement, or preservation activities; and/or (3) providing compensatory mitigation through an aquatic resource restoration, establishment, enhancement, and/or preservation activity. This final type of compensatory mitigation may be provided at or adjacent to the impact site (i.e., on-site mitigation) or at another location, usually within the same watershed as the permitted impact (i.e., off-site mitigation). This project/permit applicant shall retains responsibility for the implementation and success of the mitigation approach. **Obtain Approval of and File Notification of Streambed Alteration Agreement Prior to Construction** The applicant(s) for development on any project parcel shall ensure that the cattail marsh is not obstructed and human intrusion into the area is minimized. In compliance with Section 1600 of the California Fish and Game Code, the relevant applicant(s) of an individual development proposal within the project site shall obtain approval and file a notification of a Streambed Alteration Agreement prior to conducting any construction activities within irrigation/drainage channels that qualify as streams under CDFW jurisdiction (i.e., those having bed and bank and at least periodical flow) if and to the extent required under applicable laws and	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		regulations. Those same applicant(s) shall implement all mitigation measures imposed by the CDFW related to the subject Streambed Alteration Agreement, which may include but not be limited to the implementation of erosion and bank stabilization measures, riparian habitat enhancement, and/or restoration and revegetation of the stream corridor habitat at no less than a 1:1 ratio, as determined by the CDFW.	
Impact BIO-4: The project would not substantially interfere with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact BIO-5: The project would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	No impact	No mitigation is necessary.	No impact
Impact BIO-6: The project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Potentially Significant	MM BIO-1a through MM BIO-1f and MM BIO-3	Less Than Significant
Section 3.5—Cultural Resources			
Impact CUL-1: The project could cause a substantial adverse change in the	Potentially Significant	**MM CUL-1**: **Archaeological Spot-Monitoring and Halt of Construction**	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
significance of a historical resource as defined in Section 15064.5.		**Upon Encountering Historical or Archeological Materials** An Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology shall inspect the site once grubbing and clearing are complete for the purpose of determining whether there are any previously undiscovered resources onsite, and prior to any grading or trenching into previously undisturbed soils. This shall be followed by regular periodic or "spot-check" archaeological monitoring as determined by the Archaeologist. If the Archaeologist believes that a reduction in monitoring activities is prudent, then a letter report detailing the rationale for making such a reduction and summarizing the monitoring results shall be provided to the City of Tracy for concurrence. In the event a potentially significant cultural resource is encountered during subsurface earthwork activities, all construction activities within a 100-foot radius of the find shall cease and workers shall avoid altering the materials until an Archaeologist has evaluated the situation. The applicants for the development of the Tracy Alliance, Suvik Farms, and Zuriakat parcels shall include a standard inadvertent discovery clause in every construction contract to inform contractors of this requirement. Potentially significant cultural resources consist of but are not limited to stone, bone, glass, ceramics, fossils, wood, or	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		shell artifacts, or features including hearths, structural remains, or historic dumpsites. The Archaeologist shall evaluate any finding(s) and determine whether they are significant, and if so, shall make recommendations concerning appropriate measures that will be implemented to protect the significant resource, including but not limited to excavation and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Any previously undiscovered significant resources found during construction within the project site shall be recorded on appropriate Department of Parks and Recreation (DPR) 523 forms and shall be submitted to the City of Tracy, the Northwest Information Center (NWIC), and the California Office of Historic Preservation (OHP), as required.	
Impact CUL-2: The project could cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.	Potentially Significant	MM CUL-1	Less Than Significant
Impact CUL-3: The project could disturb human remains, including those interred outside of formal cemeteries.	Potentially Significant	**MM CUL-3**: **Stop Construction Upon Encountering Human Remains** In the event of the accidental discovery or recognition of any human remains, CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and Public Resources Code Sections 5097.94 and Section 5097.98 shall be followed. If during the course of project construction, there is accidental discovery or	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		recognition of any human remains, the following steps shall be taken: 1. There shall be no further excavation or disturbance within 100 feet of the remains until the county coroner is contacted to determine if the remains are Native American and if an investigation of the cause of death is required. If the coroner determines the remains to be Native American, the coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall identify the person or persons it believes to be the Most Likely Descendant (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work within 48 hours, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resource Code Section 5097.98. 2. Where the following conditions occur, the landowner or his or her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the most likely descendant or on the project site in a location not subject to further subsurface disturbance:	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		• The NAHC is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 48 hours after being notified by the commission. • The descendant identified fails to make a recommendation. • The landowner or his authorized representative rejects the recommendation of the descendant, and mediation by the NAHC fails to provide measures acceptable to the landowner. Additionally, California Public Resources Code Section 15064.5 requires the following relative to Native American Remains: • When an initial study identifies the existence of, or the probable likelihood of, Native American Remains within a project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC as provided in Public Resources Code Section 5097.98. The applicants for the development of the Tracy Alliance, Suvik Farms, and Zuriakat parcels may each develop a plan with respect to their individual development proposals for treating or disposing of, with appropriate dignity, the human remains, and any items associated with Native American Burials with the appropriate Native Americans as identified by the NAHC.	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cumulative Impacts	Potentially Significant	MM CUL-1 and MM CUL-3	Less Than Significant
Section 3.6—Energy			
Impact ENER-1: The proposed project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact ENER-2: The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.7—Geology and Soils			
Impact GEO-1: The proposed project could directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury or death involving: i.) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42. ii.) Strong seismic ground shaking. iii.) Seismic-related ground failure, including liquefaction. iv) Landslides.	Potentially Significant	**MM GEO-1: Prepare Grading and Construction Plans that Incorporate Geotechnical Engineering Report Recommendations** Prior to issuance of the grading permits for the proposed project, development of the final grading, foundation, and construction plans shall incorporate the site-specific earthwork, foundation, floor slab, lateral earth pressure, and pavement design recommendations, as detailed in the Geotechnical Engineering Report prepared by Terracon dated January 30, 2019. The applicant(s) for development of individual development proposal(s) within the project site shall each coordinate with a City-approved Geotechnical Engineer and Engineering Geologist to tailor the grading and	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		foundation plans for the relevant development proposal, as needed, to reduce risk related to known soil and geologic hazards. The final grading and construction plans for the relevant development proposal shall be reviewed by the City-approved Geotechnical Engineer to confirm compliance with this MM GEO-1. Grading operations shall meet the applicable requirements of the recommendations included in the Geotechnical Engineering Report prepared by Terracon on January 30, 2019. During construction, the City-approved Geotechnical Engineer shall monitor construction of the relevant development proposal to ensure the earthwork operations are properly performed in accordance with the foregoing recommendations.	
Impact GEO-2: The proposed project would not result in substantial soil erosion or the loss of topsoil.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact GEO-3: The project could be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.	Potentially Significant	MM GEO-1	Less Than Significant
Impact GEO-4: The project could be located on expansive soil, as defined in	Potentially Significant	MM GEO-1	Less Than Significant

		UCMP, where it will be properly curated and made accessible for future studies.	
Cumulative Impacts	Potentially Significant	MM GEO-1 and MM GEO-6	Less Than Significant
Section 3.8—Greenhouse Gas Emissions			
Impact GHG-1: The proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact GHG-2: The proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.9—Hazards and Hazardous Materials			
Impact HAZ-1: The proposed project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	Potentially Significant	**MM HAZ-1a**: **Conduct Soil Sampling (Tracy Alliance, Zuriakat, and Suvik Farms parcels)** Prior to the issuance of grading permits, the relevant applicant for an individual development proposal within the project site shall provide evidence of soil testing within the project boundary to confirm presence or absence of hazardous compounds such as lead and arsenic. The testing shall be conducted pursuant to a San Joaquin Environmental Health-approved sampling plan. If hazardous levels of hazardous compounds are found, excavated soils shall be sent off-site for disposal and any affected soils	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		encountered should be properly characterized, treated and/or disposed of in accordance with applicable local, State, and federal laws and regulations. The relevant applicant shall complete any residual soil remediation in connection with the relevant individual development proposal to the satisfaction of San Joaquin Environmental Health, as evidenced by the submittal of a no further action letter. In addition, if hazardous contaminants related to the former agricultural use of the site (such as lead or arsenic) are found, a construction worker health and safety plan shall be prepared and shall be implemented during construction of the relevant individual development proposal. **MM HAZ-1b**: **Proper Disposal and Decommission of Underground Storage Tanks, Aboveground Storage Tanks, and Unlabeled Drums (Tracy Alliance Parcel only)** If any of the reported underground storage tanks (USTs) or aboveground storage tanks (ASTs) are discovered during excavation activities, the applicant for the development of the Tracy Alliance parcels shall dispose of and decommission the USTs and ASTs in accordance with applicable laws and regulations of the Local Oversight Program (LOP) and the American Petroleum Institute Standards, respectively. The unlabeled drums and containers observed during the site reconnaissance for the Phase I	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Environmental Site Assessment (Phase I ESA) for the Tracy Alliance parcels shall be characterized and disposed of in accordance with applicable local, State, and federal laws and regulations. **MM HAZ-1c: Conduct Asbestos and Lead Surveys Prior to Demolition (Tracy Alliance Parcel only)** Prior to the issuance of demolition permits for the existing buildings, the applicant for the development of the Tracy Alliance parcels shall retain a licensed professional to conduct asbestos and lead paint surveys. These surveys shall be conducted prior to the disturbance or removal of any suspect asbestos-containing materials and lead-based paint, and these materials shall be characterized for asbestos and lead by a reliable method. All activities involving asbestos-containing materials and lead-based paint shall be conducted in accordance with applicable laws and regulations, and all removal shall be conducted by properly licensed abatement contractors. **MM HAZ-1d**: **Dust Mitigation and Soil Evaluation (Tracy Alliance, Zuriakat, and Suvik Farms parcels)** During any grading or excavation activities in connection with an individual development proposal within the project site, relevant development personnel shall be made aware to look for unusual	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		conditions suggesting buried debris or other potential adverse environmental conditions. If any abnormal soils are discovered during development activities, such as stained soils, hydrocarbon odors, or any other unusual odors, all construction activities near the discovery shall be stopped immediately and the applicant for the relevant individual development proposal shall contact a qualified hazardous material consulting firm for further assessment and implementation of any appropriate actions as may be required under applicable laws and regulations before construction of the relevant individual proposal can begin again. **MM HAZ-1e**: **Consultation with Chevron and DigAlert (Suvik Farms parcel only)** Prior to any ground disturbance and construction along the northern side of West Grant Line Road, adjacent to the southern boundary of the Tracy Alliance and Suvik Farms parcels, the relevant applicant(s) for the development of the Tracy Alliance and/or Suvik Farms parcels shall consult with Chevron (www.chevron-pipeline.com; 800.762.3404) and DigAlert 811 to determine the location of the existing underground petroleum pipeline to facilitate avoidance during ground disturbance and construction activities.	
Impact HAZ-2: The proposed project would not create a significant hazard to the public	Less Than Significant	No mitigation is necessary.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment.			
Impact HAZ-3: The proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact HAZ-4: The proposed project is located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public or the environment.	Potentially Significant	MM HAZ-1a and MM HAZ-1b	Less Than Significant
Impact HAZ-5: The proposed project would not be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, and result in a safety hazard or excessive noise for people residing or working in the project area.	No impact	No mitigation is necessary.	No impact
Impact HAZ-6: The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact HAZ-7: The proposed project would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.	Less Than Significant	No mitigation is necessary.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cumulative Impacts	Less Than Significant	No mitigation is necessary	Less Than Significant
Section 3.10—Hydrology and Water Quality			
Impact HYD-1: The proposed project could violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.	Potentially Significant	**MM HYD-1a**: **Prepare Stormwater Pollution Prevention Plan** Prior to the issuance of a grading permit, the relevant applicant for each individual development proposal within the project site shall submit a draft of the Notice of Intent (NOI) and Storm Water Pollution Prevention Plan (SWPPP) in connection with its individual development proposal pursuant to the then-applicable Multi-Agency Post-Construction Stormwater Standards Manual at the time the relevant grading permit is submitted. After City approval of the relevant grading permit, the relevant NOI and SWPPP shall be sent to the California State Water Resources Control Board (State Water Board) for approval. Approval by the State Water Board is a prerequisite for issuance of the relevant grading permit by the City. The SWPPP shall address stormwater management during each phase of construction of the relevant individual development proposal. Best Management Practices (BMPs) shall be integrated into the relevant SWPPP as identified by the City of Tracy, which will result in the reduction or elimination of pollutants in stormwater discharges and the stabilization of BMPs to reduce or eliminate pollutants after construction of the relevant individual development proposal is completed. The	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		relevant SWPPP shall be consistent with the applicable Regional Water Quality Control Board (RWQCB) standards and National Pollutant Discharge Elimination System (NPDES) permit requirements to protect water quality over the period of construction of the relevant individual development proposal. **MM HYD-1b**: **Prepare Stormwater Management Plan** Prior to the issuance of a grading permit, the relevant applicant for each individual development proposal within the project site shall prepare a Stormwater Management Plan in connection with its individual development proposal for review and approval by the City of Tracy. The relevant Storm Water Management Plan (SWMP) shall include two fundamental components: (1) treatment for pollutants collected in stormwater using Low Impact Development (LID) measures, and (2) no net increase in the erosion potential of the receiving stream over the pre-project (existing) condition. All LID treatment measures would be required to be designed in accordance with applicable engineering criteria in the then-applicable Multi-Agency Post-Construction Stormwater Standards Manual. Implementation of the relevant SWMP would require the preparation of a clearly defined Operations and Maintenance (O&M) Plan by the relevant applicant in connection with its	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		development proposal to ensure that installed stormwater treatment measure(s) and hydromodification management control(s) are inspected and properly operated and maintained for the life of the relevant individual development proposal.	
Impact HYD-2: The proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact HYD-3: The proposed project could substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: i.) result in substantial erosion or siltation on- or off-site; ii.) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; iii.) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or iv.) impede or redirect flood flows?	Potentially Significant	Implement MM HYD-1a MM HYD-1b and **MM HYD-3: Prepare Final Drainage Plan Prior to Grading** Each applicant for an individual development proposal within the project site shall, in connection with the relevant individual development proposal: • Comply with all applicable rules, regulations, and procedures of the National Pollutant Discharge Elimination System (NPDES) for municipal, construction and industrial activities as promulgated by the California State Water Resources Control Board (State Water Board), or any of its Regional Water Quality Control Boards (RWQCBs). • Submit a Final Stormwater Control Plan and a Stormwater Control Operation and Maintenance Plan (O&M Plan) to the City of Tracy Public Works and	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Community Development Department, which shall be reviewed for compliance with the County's National Pollutant Discharge Elimination System (NPDES) Permit and shall be determined consistent with the City's Stormwater Management and Discharge Control Ordinance (Chapter 11.34 of the Municipal Code, Ordinance 1072) prior to issuance of a grading permit for the relevant individual development proposal. Improvement Plans shall be reviewed to verify consistency with the relevant Final Stormwater Control Plan and compliance with Provision C.3 of the City's NPDES Permit and the City's Stormwater Management and Discharge Control Ordinance (Chapter 11.34 of the Municipal Code, Ordinance 1072). • Prior to issuance of grading permits for each relevant individual development proposal, the relevant applicant shall submit a Final Drainage Plan in connection with the relevant individual development proposal that incorporates the measures included in the Flood Protection Technical Memorandum. The City of Tracy Public Works and Community Development Department shall review the relevant Final Drainage Plan to ensure it is in compliance with all applicable requirements and standards, including the recommendations provided in the Flood Protection Technical	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Memorandum and in the Citywide Storm Drainage Master Plan in effect at the time building permits are issued, to reduce risk related to flooding within a designated floodplain. The relevant Final Drainage Plan shall be reviewed by City of Tracy Public Works and Community Development Department staff to ensure that all building minimum floor elevations for the relevant development proposal are at 26 feet or 1 foot above the maximum flood elevation and will accommodate the 200-year storm event as detailed in the Flood Protection Technical Memorandum. In addition, the on-site stormwater detention basin shall be designed in accordance with the recommendations provided in the Flood Protection Technical Memorandum and in accordance with the Citywide Storm Drainage Master Plan in effect at the time building permits are issued. Additionally, the relevant Final Drainage Plan shall determine if discharge of pre-project runoff rates and/or volumes into the Tom Paine Slough drainage area can continue after project construction pursuant to applicable standards and requirements. Should the relevant Final Drainage Plan determine it is feasible to discharge some runoff (possibly up to the pre-project runoff volume) into the existing downstream system, this design shall be submitted to the City of	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Tracy as part of the relevant Final Drainage Plan for review and approval.	
Impact HYD-4: The proposed project would be located in a flood hazard zone, tsunami, or seiche zone, or risk release of pollutants due to project inundation.	Potentially Significant	Implement MM HYD-3	Less Than Significant
Impact HYD-5: The proposed project could conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	Potentially Significant	Implement MM HYD-1a	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.11—Land Use and Planning			
Impact LAND-1: The proposed project would not physically divide an established community.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact LAND-2: The proposed project would not cause a significant environmental impact due to conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.12—Noise			
Impact NOI-1: The proposed project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact NOI-2: The proposed project could generate a substantial temporary or	Potentially Significant	**IMM NOI-2:** To reduce potential construction noise impacts, the following	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.		multi-part Improvement Mitigation Measure (IMM) shall be implemented for the project: • Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment. • Locate stationary operational noise-generating equipment as far as feasible from sensitive receptors when sensitive receptors adjoin or are near a construction area. In addition, the project contractor shall place such stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site to the extent feasible. • Utilize "quiet" air compressors and other stationary operational noise sources where such technology exists and is commercially practicable. • The construction contractor shall prohibit unnecessary idling (i.e., idling in excess of 5 minutes) of internal combustion engines. • The construction contractor shall, to the maximum extent practicable, locate on-site equipment staging areas so as to maximize the distance between construction-related noise sources and noise-sensitive receptors nearest the project site during all project construction. • The construction contractor shall ensure that all construction activities	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		that would occur within 550 feet of a residential land use property line shall be limited to daylight hours or to the hours of 7:00 a.m. and 7:00 p.m.	
Impact NOI-3: The proposed project would not result in generation of excessive groundborne vibration or groundborne noise levels.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact NOI-4: The proposed project would not expose people residing or working in the project area to excessive noise levels for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.13—Public Services			
Impact PUB-1: The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact PUB-2: The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered	Less Than Significant	No mitigation is necessary	Less Than Significant

governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection.			
Impact PUB-3: The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for schools.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact PUB-4: The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for parks.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact PUB-5: The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause	Less Than Significant	No mitigation is necessary.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for libraries or other public facilities.			
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.14—Transportation			
Impact TRANS-1: The proposed project would result in a substantial increase in vehicle miles traveled.	Potentially Significant	**MM TRANS-1: Transportation Demand Management Measures** **MM TRANS-1(a)**: Transportation Demand Management Measures Prior to issuance of the first building permit for the relevant individual development proposal, the relevant applicant for the individual development proposal at issue shall submit to the City of Tracy Planning Department a transportation demand management (TDM) program that incorporates all of the following six measures (as explained further in Table 3.14-6 of the Draft EIR): 1. Communication and Information Strategies–4 percent reduction; 2. Telecommuting for administrative staff (5 percent of staff population)–1 percent reduction; 3. Designated parking spaces for carpool vehicles–1 percent reduction; 4. Provide a transit stop along the project frontage on Grant Line Road, if agreed to by the City–2 percent reduction; 5. Provide bike lanes and sidewalks along the project frontage–1 percent reduction; and	Significant and Unavoidable

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		6. Provide on-site bike racks and showers–1 percent reduction. Provided, however, that if the relevant applicant determines that one of more of the foregoing six TDM measures is not feasible in connection with the individual development proposal at issue, then the relevant applicant may obtain approval from the City of Tracy Planning Department of acceptable substitute TDM measure(s) pursuant to Table 3.14-6 of the Draft EIR. The relevant applicant's TDM program, as described above, shall reflect a 10 percent reduction in VMT for the relevant individual development proposal. **MM TRANS-1(b): Payment of Applicable Banking Fee.** In addition to the TDM program required in MM TRANS-1(a), each applicant for an individual development proposal shall pay the applicable fee as set forth in the adopted VMT Mitigation Banking Fee in place and effective at the time the relevant applicant seeks to obtain building permits for its individual development proposal. Provided, however, that if the City Council has not adopted the Mitigation Banking Fee Program such that it is effective and in place at the time an applicant for an individual development proposal seeks to obtain a building permit, then payment of	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		$633.11 (cost per VMT reduction for the relevant individual development proposal) shall constitute compliance with this MM TRANS-1(b).	
Impact TRANS-2: The proposed project could substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	Potentially Significant	**MM TRANS-2:** Prepare and Implement Construction Traffic Control Plan Prior to the start of construction for ant individual development proposal, the relevant applicant shall prepare and submit a Construction Traffic Control Plan for the individual development proposal at issue. Each plan shall include the following items. Each approved plan shall be implemented during construction of the individual development proposal at issue. • Project staging plan to maximize on-site storage of materials and equipment • Permitted construction hours • Location of construction staging • Provisions for street sweeping to remove construction related debris on public streets • A set of comprehensive traffic control measures including preparation of traffic control plans, as needed; scheduling of major truck trips and deliveries to avoid peak-hours; lane closure proceedings; signs, cones, and other warning devices for drivers; and designation of construction haul routes. • Survey of the pavement condition on roadways within the relevant individual	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		development to be used as part of haul route prior to the commencement of any work on-site. The survey shall include a video tape of the roadways. Each relevant applicant shall complete any remedial work prior to initiation of use and provide a bond assuring completion of the remediation work triggered by the individual development proposal, the amount which shall be deemed sufficient by the Public Works Department. • The relevant applicant shall provide a pavement analysis for those roads along the proposed haul routes or any alternate route(s) that are proposed to be utilized by hauling operation for the individual development proposal at issue. This study shall analyze the existing pavement conditions and determine what impact the hauling operation will have over the construction period of the relevant individual development. The study shall provide recommendations to mitigate identified impacts, which shall be implemented by the relevant applicant for the individual development proposal at issue.	
Impact TRANS-3: The proposed project could result in inadequate emergency access.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact TRANS-4: The proposed project would not conflict with policies, plans, or programs regarding public transit, bicycle,	Less Than Significant	No mitigation is necessary.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.			
Cumulative Impacts	Potentially Significant	Implement MM TRANS-1(a) and MM TRANS-(b)	Significant and Unavoidable
Section 3.15—Tribal Cultural Resources			
Impact TCR-1: The proposed project could cause a substantial adverse change in the significance of a Tribal Cultural Resource that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).	Potentially Significant	Implement MM CUL-1 and MM CUL-3	Less Than Significant
Impact TCR-2: The proposed project could cause a substantial adverse change in the significance of a Tribal Cultural Resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.	Potentially Significant	Implement MM CUL-1 and MM CUL-3	Less Than Significant
Cumulative Impacts	Potentially Significant	Implement MM CUL-1 and MM CUL-3	Less Than Significant
Section 3.16—Utilities and Service Systems			
Impact UTIL-1: The proposed project would require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.	Potentially Significant	Implement MM UTIL-3 and **MM UTIL-1a: Adherence to Applicable Performance Standards and Payment of Infrastructure Fees** Prior to the issuance of building permits for an individual development proposal, the relevant applicant shall demonstrate compliance of the individual	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		development proposal at issue with applicable performance standards pursuant to the then-current Urban Water Management Plan, Citywide Water System Master Plan, Wastewater Master Plan, and Citywide Storm Drainage Master Plan. In addition, each applicant for an individual development proposal shall pay its respective proportionate share of required funding, subject to applicable laws governing nexus requirements, to the City for completion of relevant planned City Capital Improvement Plan improvements. **MM UTIL-1b: Submittal of Final Engineering Plans for Tracy Alliance Parcels** Prior to the issuance of the building permit for the first building on the Tracy Alliance parcels, the applicants for the development of the Tracy Alliance parcels shall submit engineering plans to the City of Tracy for review and approval to confirm compliance with this MM UTIL-1b. These plans shall include additional 12-inch diameter pipelines on-site as shown on Exhibit 3.16-6 of this Draft EIR and the fire service laterals shall be upsized to 14-inch diameter. **MM UTIL-1c: Submittal of Final Engineering Plans for Suvik Farms and Zuriakat Parcels** Prior to the issuance of the building permit for the first building on the subject	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		parcel, each relevant applicant for the individual development proposal of the Suvik Farms or Zuriakat Parcels, respectively, shall each submit final engineering plans to the City of Tracy for review and approval to confirm compliance with the relevant performance standards, including, but not limited to, those pursuant to the current Urban Water Management Plan, Citywide Water System Master Plan, Wastewater Master Plan, and Citywide Storm Drainage Master Plan in effect at the time building permits are requested.	
Impact UTIL-2: The proposed project would have sufficient water supplies available to serve the proposed project and reasonably foreseeable future development during normal, dry, and multiple dry years.	Potentially Significant	Implement MM UTIL-1a	Less Than Significant
Impact UTIL-3: The proposed project would result in a determination by the wastewater treatment provider, which serves or may serve the proposed project, that it has adequate capacity to serve the proposed project's projected demand in addition to the provider's existing commitments.	Potentially Significant	**MM UTIL-3: Payment of Wastewater Infrastructure Fees/Construction of Wastewater Facilities** Prior to the issuance of the first building permit for the subject individual development proposal, the relevant applicant shall participate in the implementation of the Wastewater Master Plan (WWMP) in effect at the time the relevant building permit is requested through the payment of the applicable impact fees as included in the City's Capital Improvement Plan.	Less Than Significant

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact UTIL-4: The proposed project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Impact UTIL-5: The proposed project would comply with federal, State, and local management and reduction statutes and regulations related to solid waste.	Less Than Significant	No mitigation is necessary.	Less Than Significant
Cumulative Impacts	Less Than Significant	No mitigation is necessary.	Less Than Significant
Section 3.17—Wildfire			
Impact WILD-1: The proposed project would not substantially impair an adopted emergency response plan or emergency evacuation plan.	No Impact	No mitigation is necessary.	No Impact
Impact WILD-2: Due to slope, prevailing winds, and other factors, the project would not exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.	No Impact	No mitigation is necessary.	No Impact
Impact WILD-3: The project would not require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.	No Impact	No mitigation is necessary.	No Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact WILD-4: The proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.	No Impact	No mitigation is necessary.	No Impact
Cumulative Impacts	No Impact	No mitigation is necessary.	No Impact

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 1: INTRODUCTION

This Draft Environmental Impact Report (Draft EIR) for the Tracy Alliance Project (proposed project) has been prepared in accordance with applicable criteria, standards, and procedures of the California Environmental Quality Act (CEQA), as amended (California Public Resources Code [PRC], § 21000, *et seq*.) and the CEQA Guidelines (California Code of Regulations [CCR], Title 14, § 15000, *et seq*.). In accordance with Sections 21067, 15367, and 15050–15053 of the CEQA Guidelines, the City of Tracy (City) is the lead agency under whose authority this document has been prepared. As an informational document, this Draft EIR is intended for use by the City and other public agency decision makers, interested organizations and members of the public in evaluating the potential environmental impacts of the proposed project.

1.1 - Project Overview

The proposed project consists of the development of up to 3,352,320 square feet of warehouse and distribution and related uses on a total of approximately 191.18 acres. The site consists of six parcels under ownership by three separate parties: the Tracy Alliance Group owns two parcels (totaling approx. 122.44 acres), Suvik Farms, LLC owns three parcels (totaling approximately 46.61 acres), and Zuriakat owns one parcel (approximately 22.17 acres).

The project site is within unincorporated San Joaquin County adjacent to the City of Tracy's northeastern city limits and adjacent to the City of Tracy Northeast Industrial (NEI) Specific Plan area (Exhibit 2-1 and Exhibit 2-2 in the Project Description). The proposed project would require approval of annexation into the City of Tracy, pre-zoning, an amendment to the NEI Specific Plan, and a Tentative Parcel Map or Lot Line Adjustment(s) to create the final lot configurations (Exhibit 2-3 in the Project Description depicts the proposed parcel reconfiguration, which depicts the ultimate parcels).

The proposed project also includes demolition of existing residential and agricultural buildings, removal of existing trees and crops, construction of on- and off-site roadway improvements, and grading of approximately 500,000 cubic yards, which would be balanced on-site. Of the 500,000 cubic yards of material graded, approximately 300,000 cubic yards would occur on the Tracy Alliance parcels, approximately 150,000 cubic yards would occur in development of the Suvik Farms parcels, and approximately 50,000 cubic yards would occur in development of the Zuriakat parcel.

Development on the two Tracy Alliance parcels would consist of approximately 1,849,500 square feet of warehouse and distribution space located in three buildings, as well as a stormwater detention basin with pump station that would be City-owned and managed. Approximately 12.51 acres of the Tracy Alliance land would be reserved to accommodate a portion of a planned interchange at Paradise Road and Interstate 205 (I-205). However, the potential impacts of constructing this future interchange would undergo a separate environmental review process pursuant to the CEQA and National Environmental Policy Act (NEPA), once funding is programmed and available and once the ultimate design of the interchange is finalized; accordingly, the construction of the interchange is not considered part of the proposed project. In addition to the

proposed development on the Tracy Alliance parcels, this Draft EIR evaluates the maximum development potential that could occur on the remaining parcels (Suvik Farms and Zuriakat), which is estimated to consist of up to 1,502,820 square feet of warehouse and distribution development, consistent with the maximum allowable density per acre identified in the NEI Specific Plan.

Chapter 2, Project Description, provides a complete description of the proposed project.

1.2 - Environmental Review Process

An EIR is an informational document used by a lead agency (in this case, the City) when considering approval of a proposed project. The purpose of an EIR is to provide public agencies, other interested organizations, and members of the public with detailed information regarding the environmental effects associated with implementing a project. An EIR should analyze the environmental consequences of a project, and should also identify ways to feasibly reduce or avoid the proposed project's potential environmental effects through design refinements, mitigation, or the identification of project alternatives that could avoid or reduce impacts while still achieving most of the project objectives. Pursuant to CEQA, State and local government agencies must consider the environmental consequences of projects over which they have discretionary authority. This Draft EIR provides information to be used in the planning and decision-making process. It is not the purpose of an EIR to recommend approval or denial of a proposed project.

Before approval of the proposed project, the City, as lead agency and the land use decision-making entity, is required to certify that this EIR has been completed in compliance with CEQA, that the information in the EIR has been considered, and that the EIR reflects the independent judgment of the City. Pursuant to CEQA, if there are significant and unavoidable impacts identified in an EIR, then decision makers must balance the benefits of a project against its unavoidable environmental consequences. If environmental impacts are identified as significant and unavoidable, the City may still approve the proposed project if it finds that social, economic, legal, technological, or other benefits outweigh the unavoidable impacts, the reasoning for which the City would state in writing, based on information in the EIR and other information sources in the administrative record. This written document that sets forth this reasoning is called a "statement of overriding considerations" (PRC § 21081; CEQA Guidelines § 15093).

In addition, the City as lead agency must adopt a Mitigation Monitoring and Reporting Program (MMRP) describing the identified mitigation measures that are to be made enforceable conditions of project approval to feasibly avoid or mitigate significant effects on the environment (PRC § 21081.6; CEQA Guidelines § 15097). The MMRP is adopted at the time of project approval and is designed to ensure compliance with the Project Description and EIR mitigation measures during and after project implementation. If the City decides to approve the proposed project, it would be responsible for verifying that the MMRP for this proposed project is implemented. In addition, the EIR will be used by the City and responsible and trustee agencies, as relevant, during approval of future discretionary actions and permits that are necessary to implement the proposed project.

This Draft EIR provides a project level analysis for the proposed project. For the purposes of analysis in this Draft EIR, because the applicant for the Tracy Alliance parcels has submitted an individual

development proposal for these parcels, this Draft EIR evaluates, as required under CEQA, the specific aspects of that proposal. With respect to the remaining portions of the project site, individual development proposals have not yet been submitted. Accordingly, this Draft EIR evaluates at a project level full buildout of the project site as contemplated under the proposed project, based on information that is reasonably available and reflects reasonable assumptions of maximum development potential that could occur on the remaining parcels (Suvik Farms and Zuriakat). This is estimated to consist of up to 1,502,820 square feet of warehouse and distribution development, consistent with the maximum allowable density per acre identified in the NEI Specific Plan (see Table 2-2 in the Project Description for a summary of the proposed development). The level of analysis for Suvik Farms and Zuriakat parcels reflects the level of detail available at the time of preparation of this Draft EIR. The environmental impacts of the proposed project are analyzed in the Draft EIR to the degree of specificity appropriate, in accordance with CEQA Guidelines Section 15146. This document addresses the potentially significant adverse environmental impacts that may be associated with the construction and operation of the proposed project. It also identifies appropriate and feasible mitigation measures and a reasonable range of potentially feasible alternatives as required under CEQA.

CEQA requires that an EIR contain, at a minimum, certain specific components. These components are contained in this Draft EIR and include:

- Table of Contents
- Introduction
- Executive Summary
- Project Description
- Environmental Setting
- Significant Environmental Impacts
- Mitigation Measures
- Cumulative Impacts
- Significant Unavoidable Adverse Impacts
- Alternatives to the Proposed Project
- Growth-Inducing Impacts
- Effects Found not to be Significant
- Areas of Known Controversy

The City is designated as the lead agency for the proposed project. CEQA Guidelines Section 15367 defines the lead agency as ". . . the public agency, which has the principal responsibility for carrying out or approving a project." Other public agencies may use this Draft EIR in the decision-making or permit process and consider the information in this Draft EIR along with other information that may be presented during the CEQA process.

This Draft EIR was prepared by FirstCarbon Solutions (FCS), an environmental consultant, under contract to the City. Prior to public review, it was extensively reviewed and evaluated by the City. This Draft EIR reflects the independent judgment and analysis of the City as required by CEQA. Lists of organizations and persons consulted and the report preparation personnel is provided in Chapter 7 of this Draft EIR.

1.3 - Purpose and Legal Authority

1.3.1 - Notice of Preparation and Public Scoping Process

In accordance with Sections 15063 and 15082 of the CEQA Guidelines, the City, as lead agency, sent a Notice of Preparation (NOP) to responsible and trustee agencies, other public agencies and organizations, and members of the public on August 28, 2020, thus beginning the formal CEQA scoping process. The purpose of the scoping process is to allow the public, government agencies, and other interested organizations to provide input on the scope of the EIR. The scoping period began on August 28, 2020, and ended on September 30, 2020, representing the statutory 30-day public review period. Seven comment letters were received in response to the NOP. The NOP and comment letters are provided in Appendix A. Comments are summarized in Table 1-1, with cross-references to applicable Draft EIR sections, as appropriate, where analysis is included to address the comments received.

Pursuant to Section 15083 of the CEQA Guidelines, the NOP provided notice that the City would hold a public scoping meeting on September 9, 2020, starting at 7:00 p.m. Pacific Standard Time (PST) via a videoconference platform. At this meeting, attendees were given an opportunity to provide comments and express concerns about the potential effects of the proposed project; however, no public comments were received during the scoping meeting.

Table 1-1: Summary of EIR Scoping Comments

Agency/Organization	Author	Date	Comment Summary	Coverage in the Draft EIR
Public Agencies				
Native American Heritage Commission	Nancy Gonzalez-Lopez, Cultural Resources Analyst	8.31.2020	Compliance with Assembly Bill (AB) 52 and Senate Bill (SB) 18 regarding the requirements of tribal consultation as a result of an EIR and NOP. Author provides examples of appropriate mitigation measures if applicable. The author provides recommendations for cultural resource assessments and the necessary steps to follow in order to fully determine the existence and significant of tribal cultural resources on or near the project site.	Section 3.5: Cultural and Section 3.15: Tribal Cultural Resources
California Department of Toxic Substances Control	Gavin McCreary, Project Manager	9.8.2020	Hazards and Hazardous Materials, potential for historic or future activities on or near the project site to result in the release of hazardous wastes/substances on the project site. The EIR should also identify the mechanism(s) to initiate any required investigation and/or remediation and the government agency who will be responsible for providing appropriate regulatory oversight. Because of the potential for Aerially Deposited Lead-contaminated soil, the California	Section 3.9: Hazards and Hazardous Materials

Agency/Organization	Author	Date	Comment Summary	Coverage in the Draft EIR
			Department of Toxic Substances Control (DTSC) recommends collecting soil samples for lead analysis prior to performing any intrusive activities for the project described in the EIR. If applicable, proper investigation for mine waste should be discussed in the EIR. Surveys should be conducted on buildings that would be demolished for the presence of lead-based paints or products, mercury, asbestos containing materials, and polychlorinated biphenyl caulk. If applicable, proper sampling should be conducted to ensure that the imported soil is free of contamination. If any sites included as part of the proposed project have been used for agricultural, weed abatement or related activities, proper investigation for organochlorinated pesticides should be discussed in the EIR. The DTSC recommends the current and former agricultural lands be evaluated in accordance with DTSC's 2008 Interim Guidance for Sampling Agricultural Properties.	
California Department of Conservation	Monique Wilber, Conservation Program Support Supervisor	9.24.2020	The commenter requests that the EIR specify the type, amount, and location of farmland conversion resulting directly and indirectly from implementation of the proposed project. The commenter asks that impacts on any current and future agricultural operations in the vicinity; e.g., land use conflicts, increases in land values and taxes, loss of agricultural support infrastructure such as processing facilities, etc. should be discussed in the EIR. The commenter requests that the EIR describe the incremental impacts leading to cumulative impacts on agricultural land. This would include impacts from the proposed project, as well as impacts from past, current, and likely future projects. The commenter asks that any proposed mitigation measures for all impacted agricultural lands within the proposed project area be described. The commenter asks that the EIR evaluate the project's compatibility with, or potential contract resolutions for land in	Section 3.2: Agriculture and Forestry Resources

Agency/Organization	Author	Date	Comment Summary	Coverage in the Draft EIR
			an agricultural preserve and/or enrolled in a Williamson Act contract.	
San Joaquin Valley Air Pollution Control District	Arnaud Marjollet, Director of Permit Services	9.30.2020	The commenter provides comments related to criteria air pollutant emissions, construction emissions, operational emissions, recommended using the California Emissions Estimator Model (CalEEMod), Truck Routing, cleanest available trucks, reduce idling of heavy duty trucks, use of on-site electric road equipment, voluntary emission reduction agreement, health risk assessment, a health impact discussion, ambient air quality analysis, and cumulative air impacts.	Section 3.3: Air Quality and Section 3.8: Greenhouse Gas Emissions
Central Valley Regional Water Quality Control Board (RWQCB)	Nicholas White, Water Resource Control Engineer	9.30.2020	The commenter explains the various RWQCB regulations and policies that would need to be discussed in the EIR and properly mitigated for. In addition, the commenter explains the types of permits required for this project to comply with regulations meant to protect water quality.	Section 3.10: Hydrology and Water Quality
Delta Stewardship Council	Jeff Henderson, AICP Deputy Executive Office	9.30.2020	The commenter states that the City should consult with SJCOG to determine whether the proposed project is consistent with the Sustainable Communities Strategy (SCS) and should identify this in the Land Use and Planning section of the Draft EIR. Projects that are consistent with the SCS are not considered to be a covered action under the Delta Plan. The comment lists Delta Plan regulatory policies that may apply to the proposed project if the proposed project is later determined to be a covered action. In particular, Delta Plan Mitigation Measure (MM) 7-1 is of particular relevance to the proposed project, which would be located on prime agricultural land, including three parcels under a Williamson Act contract. The additional truck traffic associated with the proposed project could have significant cumulative health effects on the residents of Banta, in combination with other recent and planned projects in the Northeast Industrial Specific Plan area and baseline noise, traffic, and air	Section 3.2: Agriculture and Forestry Resources, Section 3.3: Air Quality, Section 3.8: Greenhouse Gas Emissions, Section 3.11: Land Use and Planning, Section 3.12: Noise, and Section 3.14: Transportation

Agency/Organization	Author	Date	Comment Summary	Coverage in the Draft EIR
			quality levels. The Air Quality section of the EIR should include an analysis of the cumulative health impacts on sensitive receptors in Banta.	
San Joaquin Council of Governments (SJCOG)	Laurel Boyd	10.12.2020	The commenter states that the City of Tracy is a signatory to San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) and that the project site would fall in the planning area. The commenter explains that participation in the SJMSCP satisfies requirements of both the state and federal endangered species acts, and ensures that the impacts are mitigated below a level of significance in compliance with CEQA. The commenter recommends that the co-applicants Schedule a SJMSCP Biologist to perform a pre-construction survey prior to any ground disturbance. The commenter also explains that the project would need to implement SJMSCP Incidental take Minimization Measures and mitigation requirements.	Section 3.4: Biological Resources
Source: FCS 2020.				

1.3.2 - Public Review

Upon completion of the public Draft EIR, the City filed a Notice of Completion (NOC) with the State Office of Planning and Research (OPR) to begin the public review period (PRC § 21161, CEQA Guidelines §§ 15085(a) and 15372). Concurrent with the NOC, the City also provided the related Notice of Availability (NOA) (CEQA Guidelines § 15087(a)), and the Draft EIR has been distributed to responsible and trustee agencies, other affected agencies, San Joaquin County, surrounding cities, and interested parties, as well as all parties requesting a copy of the Draft EIR in accordance with Public Resources Code 21092(b).

An electronic copy of the Draft EIR, including the technical appendices, can be viewed on the City's website at https://www.cityoftracy.org/our-city/departments/planning/specific-plans-environmental-impact-reports-and-initial-studies. A hard copy of the Draft EIR, including the technical appendices, can be viewed at the following locations (please check with the facility for hours of operation).:

City of Tracy
Development and Engineering Services
333 Civic Center Plaza
Tracy, CA 95376

Tracy Branch Library
20 East Eaton Avenue
Tracy, CA 95376

Agencies, organizations, and interested parties have the opportunity to comment on the Draft EIR during the 45-day public review period. Written comments on the Draft EIR should be addressed to:

Victoria Lombardo, Senior Planner
City of Tracy
Development Services
333 Civic Center Plaza
Tracy, CA 95376
Phone: 209.831.6428
Email: victoria.lombardo@cityoftracy.org

Submittal of electronic comments in Microsoft Word or Adobe PDF format is encouraged. Upon completion of the 45-day public review period, written responses to all significant environmental issues raised will be prepared and made available for review by the commenting agencies, organizations and public at least 10 days prior to the public hearing before the Tracy City Council on the proposed project, at which the certification of the Final EIR will be considered prior to the Council taking action on the proposed project. Comments received and the responses to comments will be included as part of the record for consideration by decision makers for the proposed project.

1.3.3 - Environmental Issues Determined not to be Significant

The NOP identified topical areas that were determined not to be significant. An explanation of why each area is determined not to be significant is provided in Chapter 4, Effects Found not to be Significant. These topical areas are as follows:

- Mineral Resources
- Population and Housing
- Parks and Recreation

1.3.4 - Potentially Significant Environmental Issues

The NOP found that the following topical areas may contain potentially significant environmental issues that will require further analysis in the Draft EIR. These sections are as follows:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

1.4 - Draft EIR Document Organization

This Draft EIR is organized into the following main sections:

- **Chapter ES: Executive Summary.** This Chapter includes a summary of the proposed project and alternatives to be addressed in the Draft EIR. A brief description of any areas of controversy and issues to be resolved and an overview of the MMRP—in addition to a table that summarizes impacts, mitigation measures, and level of significance after mitigation—are also included in this Chapter.
- **Chapter 1: Introduction.** This Chapter provides an introduction and overview describing the purpose of this Draft EIR, its scope and components, and its review and certification process.
- **Chapter 2: Project Description.** This Chapter includes a detailed description of the proposed project, including location, site, and project characteristics. A discussion of project objectives intended uses of the Draft EIR, responsible and trustee agencies, and discretionary approvals that are needed for the proposed project are also provided.
- **Chapter 3: Environmental Impact Analysis.** This Chapter analyzes environmental impacts of the proposed project. Impacts are organized into major topical areas. Each topical area includes a description of the environmental setting, regulatory framework, significance criteria, methodology used in the analysis, specific thresholds of significance, impact analyses, mitigation measures (when applicable), and significance conclusions, as well as cumulative impacts associated with the project, including impacts of past, present, and reasonably foreseeable probable future projects. The specific environmental topical sections that are addressed within Chapter 3 are as follows:
  - **Section 3.1—Aesthetics:** Addresses potential visual impacts related to intensification and overall increase in illumination that would be produced by the proposed project.
  - **Section 3.2—Agriculture and Forestry Resources:** Addresses potential for conversion of Important Farmland to nonagricultural use and forest land to non-forest use.
  - **Section 3.3—Air Quality:** Addresses potential air quality impacts associated with project implementation and emissions of criteria pollutants. The section also evaluates project emissions of toxic air contaminants.
  - **Section 3.4—Biological Resources:** Addresses potential impacts on special-status habitat, vegetation, and wildlife; potential degradation or elimination of important habitat for special-status species; and impacts on listed, proposed, and candidate threatened and endangered species.
  - **Section 3.5—Cultural Resources:** Addresses potential impacts related to historical and archaeological resources, and burial sites.
  - **Section 3.6—Energy:** Addresses potential project impacts related to energy usage.
  - **Section 3.7—Geology and Soils:** Addresses potential impacts related to soils and assesses effects of project-related development in relation to geologic and seismic conditions. Also addresses potential impacts related to paleontological or unique geologic resources.
  - **Section 3.8—Greenhouse Gas Emissions:** Addresses potential project emissions of greenhouse gases.
  - **Section 3.9—Hazards and Hazardous Materials:** Addresses potential for presence of hazardous materials or conditions on the project site and vicinity that may have potential to create a significant hazard to the public or the environment.

- **Section 3.10—Hydrology and Water Quality:** Addresses potential impacts related to local hydrological conditions, including drainage areas and changes in flow rates, as well as the proposed project's potential impacts to water quality, erosion, and groundwater supplies.
- **Section 3.11—Land Use and Planning:** Addresses potential land use impacts associated with division of an established community and consistency with relevant land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental impact.
- **Section 3.12—Noise:** Addresses potential noise impacts during construction and at project buildout from mobile and stationary sources on sensitive receptors. The section also addresses potential impact related to groundborne vibration and groundborne noise.
- **Section 3.13—Public Services:** Addresses potential impacts of the proposed project upon public services, including fire protection, law enforcement, schools, parks, recreational facilities, and library facilities in terms of the need to provide new or physical alter facilities in order to maintain acceptable service ratios, response times, or other performance objectives.
- **Section 3.14—Transportation:** Addresses potential impacts related to the local and regional roadway system with respect to Vehicle Miles Traveled (VMT) and public transportation, bicycle, and pedestrian access. Also includes a non-CEQA operational analysis for informational purposes.
- **Section 3.15—Tribal Cultural Resources:** Addresses potential project impacts related to tribal cultural resources.
- **Section 3.16—Utilities and Services Systems:** Addresses potential impacts related to service providers, including water supply, stormwater, wastewater, solid waste, and energy (electric and natural gas) providers and telecommunications, with respect to the proposed project's potential to require or result in the construction of new or expanded infrastructure.
- **Section 3.17—Wildfire:** Addresses potential impacts related to wildfire including lands within State responsibility areas and lands classified as very high fire hazard severity zones.

- **Chapter 4: Effects Found not to be Significant.** This Chapter contains analysis of topical sections not addressed in Chapter 3.
- **Chapter 5: Other CEQA Considerations.** This Chapter provides a summary of significant environmental impacts, including unavoidable and growth-inducing impacts, as well as significant irreversible environmental changes.
- **Chapter 6: Alternatives to the Proposed Project.** This Chapter compares impacts of the project with four land use project alternatives: the No Project Alternative, Outside Storage Allowable Use Alternative, and the Agricultural Protection Alternative**.** An environmentally superior alternative is identified. In addition, alternatives initially considered but rejected from further consideration are discussed.
- **Chapter 7: Persons and Organizations Consulted/List of Preparers.** This Chapter contains a list of persons and organizations that were consulted during preparation of the Draft EIR. This Chapter also contains a list of authors who assisted in preparation of the Draft EIR by name and affiliation.

- **Appendices.** The Draft EIR appendices include notices and other procedural documents pertinent to the Draft EIR, as well as supporting technical materials. The following supporting materials and technical studies and analyses were prepared for the proposed project in support of preparation of this Draft EIR**:**
  - Air Quality/Greenhouse Gas Emissions/Energy Analysis
  - Biological Resources Assessment
  - Phase I Cultural Resources Assessment
  - Paleontological Records Research and Review
  - Noise Analysis
  - Traffic Impact Study and VMT Analysis Memorandum
  - Review of Applicant-prepared Studies
    - Phase I Environmental Site Assessments
    - Limited Site Investigation
    - Flood Protection Technical Memorandum
    - Geotechnical Engineering Report
    - Water Supply Assessment

1.5 - Documents Incorporated by Reference

As permitted by CEQA Guidelines Section 15150, this Draft EIR has referenced, among other things, several technical studies, analyses, and previously certified environmental documentation. Information from relevant documents, which have been incorporated by reference, has been briefly summarized in the appropriate section(s), where possible or briefly described if the data or information cannot be summarized. Where all or part of another document is incorporated by reference, the incorporated language shall be considered to be set forth in full as part of the text of this Draft EIR. The documents and other sources that have been used in the preparation of this Draft EIR include but are not limited to:

- City of Tracy General Plan
- City of Tracy General Plan EIR (State Clearinghouse [SCH] No. 992122069)
- City of Tracy Supplemental General Plan EIR (SCH No. 2008092006)
- City of Tracy Zoning Code
- City of Tracy 2015-2023 Housing Element
- Northeast Industrial Area Specific Plan and EIR (SCH No. 95102050)
- Northeast Industrial Area Specific Plan
- Citywide Water System Master Plan
- Wastewater Master Plan
- Citywide Storm Drainage Master Plan
- Urban Water Management Plan for the City of Tracy
- San Joaquin County General Plan
- San Joaquin County General Plan EIR (SCH No. 2013102017)
- San Joaquin County Code of Ordinances

The City of Tracy General Plan, City of Tracy General Plan EIR, City of Tracy Zoning Code, and the referenced documents and other sources used in preparation of the EIR can be viewed here: https://www.cityoftracy.org/our-city/departments/planning/specific-plans-environmental-impact-reports-and-initial-studies. The above-referenced documents and other sources used in the preparation of the Draft EIR will also be available to the public for inspection at the addresses shown in Section 1.3.2 in accordance with CEQA Guidelines Section 15150(b).

CHAPTER 2: PROJECT DESCRIPTION

2.1 - Overview

The Tracy Alliance Group, Suvik Farms, LLC, and Zuriakat (co-applicants) are proposing the Tracy Alliance Project (proposed project), which consists of the development of up to 3,352,320 square feet of warehouse and distribution and related development on a total of approximately 191.18 acres comprising six parcels. The six parcels consist of two Tracy Alliance parcels (totaling approximately 122.44 acres), three Suvik Farms, LLC parcels (totaling approximately 46.61 acres), and one Zuriakat parcel (approximately 22.17 acres).

The project site is within unincorporated San Joaquin County adjacent to the City of Tracy's northeastern city limits and adjacent to the City of Tracy Northeast Industrial (NEI) Specific Plan area. The proposed project would require approval of annexation into the City of Tracy, pre-zoning, an amendment to the NEI Specific Plan, and a Tentative Parcel Maps or Lot Line Adjustment(s) to create final development lots.

Development on the two Tracy Alliance parcels, as proposed by co-applicant Tracy Alliance Group, would consist of approximately 1,849,500 square feet of warehouse and distribution space located in three buildings, as well as an approximately 12.44-acre stormwater detention basin with pump station (that would be City owned and managed). Approximately 12.51 acres of the Tracy Alliance land would be reserved to accommodate a portion of a planned interchange at Paradise Road and Interstate 205 (I-205). However, the potential impacts of constructing this future interchange would undergo a separate environmental review process pursuant to the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) once funding is programmed and available and once the ultimate design of the interchange is finalized; accordingly, the construction is not considered part of the proposed project (although the interchange is assumed to be in place as part of the cumulative conditions within the Transportation Impact Analysis prepared by Kimley Horn).

Development plans for the Suvik Farms, LLC parcels (identified as Suvik Farms parcels) and the Zuriakat parcel are not specified at this time. For the purposes of analysis in this Draft Environmental Impact Report (Draft EIR), buildout of these parcels is estimated to consist of a total of approximately 1,502,820 square feet of warehouse and distribution development, consistent with the maximum allowable density per acre identified in the NEI Specific Plan.

The proposed project also includes demolition of existing residential and agricultural buildings, removal of existing trees and crops, on- and off-site road improvements, and grading of approximately 500,000 cubic yards, which would be balanced on-site. Of the 500,000 cubic yards of material graded, approximately 300,000 cubic yards would occur on the Tracy Alliance parcels, approximately 150,000 cubic yards would occur in development of the Suvik Farms parcels, and approximately 50,000 cubic yards would occur in development of the Zuriakat parcel.

The purpose of this Draft EIR is to identify potential environmental impacts of the proposed project. This chapter provides a detailed overview of the project site location and setting, project objectives,

details, characteristics, and construction phasing. It also describes intended uses of the Draft EIR by agencies with discretionary permitting and approval authority over the proposed project, as well as the required discretionary permits and approvals to implement the proposed project.

2.2 - Project Location and Setting

2.2.1 - Location

Regional Location

The City of Tracy (City) is in the northern San Joaquin Valley of California. The City is bordered on all sides by unincorporated San Joaquin County. To the north, the City is roughly bordered by I-205 and agricultural lands, including dairy operations; to the east by the unincorporated community of Banta and other residential and industrial uses; to the south by open space; and to the west by open space and agricultural lands (Exhibit 2-1). The City covers 26 square miles and has historically been a semi-rural residential community with many light industrial uses such as warehouse, logistics, and distribution facilities. Major roadway networks including I-580, I-205, and I-5 provide regional access to the City and surrounding areas.

Local Setting

The project site is located at the northeast corner of Grant Line Road and Paradise Road (see Exhibit 2-2.). The site is within unincorporated County land adjacent to the northeastern city limits and within the City's Sphere of Influence (SOI) (10-year planning horizon). The project site is directly east of the City's NEI Specific Plan boundary. The project site lies at United States Geological Survey (USGS) Union Island 7.5-minute Quadrangle Section 22, 23, and 24 (and El Pescadero Land Grant) Township 2 South, Ranch 5 East (Latitude 37°45'33" North; Longitude 121°23'07" West). The site is bound by I-205 to the north, California Avenue to the northeast, Grant Line Road to the south, and Paradise Road to the west (see Exhibit 2-2). The site is currently accessed from Grant Line Road and Paradise Road. Paradise Road runs north/south and crosses I-205. No on- or off-ramps exist at the intersection of I-205 and Paradise Road.

2.2.2 - Existing Project Site Characteristics

The project site consists of six parcels, as shown in Exhibit 2-3 and listed in Table 2-1. In this Draft EIR, parcels may be referenced by Assessor's Parcel Number (APN) or the name of the current owner (e.g., APN 213-170-14 is also referenced as the Zuriakat parcel).

Table 2-1: Existing Parcels

Assessor's Parcel Number	Parcel Naming Convention	Address	Ownership/Applicant	Acreage (approx.)
213-170-14	Zuriakat Parcel	6050 California Avenue	Zuriakat/Not Applicable	22.17
213-170-24 213-170-25 213-170-26	Suvik Farms Parcels	6103 Grant Line Road 6281 Grant Line Road 6301 Grant Line Road	Suvik Farms/Souza Realty and Development	31.67 11.70 3.24

Assessor's Parcel Number	Parcel Naming Convention	Address	Ownership/Applicant	Acreage (approx.)
213-170-27 213-170-48	Tracy Alliance Parcels	6599 Grant Line Road Grant Line Road (no street number)	Tracy Alliance/Tracy Alliance Group Pacific T&T Company/Tracy Alliance Group	122.39 0.05
			Total	**191.22**[1]

Notes:
1. Numbers do not sum to 191.18, total acreage included throughout the Draft EIR, due to rounding.
Source: San Joaquin County. no date. Assessor's Map. Book 213. Page 17.

The project site is relatively flat and low in elevation (approximately 15-30 feet above mean sea level) with a gentle topographic slope in the north-northeast direction.[1,2] The Suvik and Zuriakat parcels do not contain any structures, only row crops.

The Tracy Alliance parcels are currently occupied by two existing approximately 1,000-square-foot residences (one occupied and one vacant), associated landscaping, and nine agricultural outbuildings used for equipment storage and maintenance, all located in the southwest corner of the property. The agricultural buildings began to appear in the 1930s, and an active dairy was present on-site from the 1950s to the 1970s.

Approximately 118 acres of the Tracy Alliance parcels are currently used for row crop production, including alfalfa, winter wheat, and almonds, with a small cattail marsh in an irrigation/drainage channel along the southern side of California Avenue. Several private dirt roads provide access within the project site; an irrigation/drainage channel runs along several of these roads. There is also a paved irrigation/drainage channel between the Tracy Alliance parcels and the Zuriakat parcel. In addition, there are streetlights and power and telecommunication lines in various locations surrounding the project site.

The project site provides suitable foraging habitat with potential to support birds of prey, including Swainson's hawk. Northern portions of the site are within a 100-year floodplain as designated by the Federal Emergency Management Agency (FEMA).[3] There are approximately 188 acres of the project site that are considered Prime Farmland as mapped by the California Department of Conservation Farmland Mapping and Monitoring Program. Prime Farmland has the best combination of features able to sustain long-term agricultural production with sustained high yields.[4] The Suvik Farms parcels are encumbered by a Williamson Act contract, which is set to expire in 2026.[5] Existing site conditions are shown in Exhibit 2-4 through 2-4e.

4 California Department of Conservation, Division of Land Resource Protection. 2018. San Joaquin County Important Farmland 2016. May.
5 The Williamson Act enables local governments to enter contracts with private landowners to restrict specific parcels to agricultural or related open space use. In return, landowners receive lower property tax assessments.

2.2.3 - Existing Land Use Designation and Zoning

Land Use Designations

The San Joaquin County General Plan (County General Plan) designates the site as Agriculture-Urban Reserve (A/UR) (Exhibit 2-5), which allows for agricultural uses, farm-related residential use, and open space and parks.[6]

The A/UR designation also reserves areas for urban development if the area is designated for urban development in a city's general plan, and the County determines the area is a reasonable future expansion for the city.

The City of Tracy General Plan (General Plan) designates the project site as Industrial (I) (Exhibit 2-6). Primary land uses allowed under this designation consist of flex/office space, manufacturing, warehousing and distribution, and ancillary uses for workers' needs (e.g., restaurants, parks, consumers services, etc.). The maximum allowed floor area ratio (FAR) is 0.5.[7]

Zoning

The site is zoned General Agriculture, with a minimum parcel size of 40 acres (AG-40) on the County's Zoning Map (Exhibit 2-5). AG zoning preserves agricultural lands for continuation of commercial agricultural enterprises.[8]

The project site is not currently within city limits; accordingly, the City of Tracy does not currently provide a zoning designation for the project site. The co-applicants are requesting approval of a boundary reorganization (to annex the project site into the City of Tracy and detach the project site from the Tracy Rural Fire District), pre-zoning of the project site to a designation of NEI Specific Plan, and an amendment to the boundaries of the NEI Specific Plan to incorporate the project site (as well as any conforming amendments to the NEI Specific Plan to ensure consistency).

2.2.4 - Surrounding Land Uses

The area surrounding the project site has both an agricultural and industrial character. Land uses north of California Avenue consist of single-family homes; there is a cell tower just east of the terminus of California Avenue. A vehicle dealership and agricultural lands are also to the north (north of I-205). East of the project site is agricultural land with associated single-family homes and agricultural structures and outbuildings. Neighboring properties south and west of the project site consist of agricultural lands and industrial warehouses, which are part of the NEI Specific Plan area, with vacant lots interspersed among the agricultural and industrial lands to the west.

[8] San Joaquin County. 2001. Ordinance Code of San Joaquin County. Section 9-600.1.

2.3 - Project Objectives

In general, the overall purpose of the proposed project is to provide high-quality industrial warehousing and distribution uses to attract businesses to the City of Tracy and to provide local employment opportunities.

The quantifiable objectives of the Tracy Alliance Project include the following:

- Development of approximately 167 acres of industrial uses (building and parking areas and related improvements);
- Development of approximately 12.44 acres of public facilities (storm basin);
- Reserve approximately 12.51 acres for future planned interchange at Paradise Road and I-205; and
- Build a maximum of 3,352,320 square feet of employment-generating industrial uses.

Additional qualitative objectives for the proposed project are as follows:

- **Employment Opportunities:** Provide for local and regional employment opportunities that take advantage of the project site's high level of accessibility, allow for the expansion of the City's economic base, help improve the jobs/housing balance, and reduce the commute for regional residents.
- **Transportation:** Provide an efficient circulation system, including reserving land for a future planned interchange at Paradise Road and I-205 (construction of the interchange would not be completed as part of the proposed project).
- **Public Facilities and Services:** Provide infrastructure and services to serve the proposed project that meet applicable City standards and integrate with existing and planned facilities.
- **Phasing:** Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet applicable City standards.

2.4 - Project Components

2.4.1 - Land Uses

The proposed project includes demolition of 11 existing residential and agricultural structures on approximately four acres located at the southwestern corner of the Tracy Alliance parcels, removal of all crops and some existing trees, and construction of the following primary components:

- Multiple warehouse buildings totaling up to 3,352,320 square feet that support industrial uses and associated offices;
- An approximately 12.44-acre City owned and managed stormwater detention basin with pump station;

- Ample landscaping consistent with all applicable City requirements; for example, in connection with the individual development proposal for the Tracy Alliance parcels, the relevant site plan reflects approximately 110,000 square feet of landscaped areas; and
- Sufficient on-site parking for both vehicles and trailer spaces consistent with all applicable City requirements; for example, in connection with the individual development proposal for the Tracy Alliance parcels, the relevant site plan reflects approximately 1,134 automobile parking spaces and approximately 572 trailer parking spaces.

Currently, there are no individual development proposals that have been formally submitted for either the Suvik or Zuriakat parcels. Therefore, for purposes of a conservative analysis, this Draft EIR has assumed warehouse and distribution uses on these parcels would be developed to the maximum intensity allowed under the NEI Specific Plan. In addition, as noted above, these parcels would be required to adhere to all applicable development standards and design guidelines, including those related to landscaping and parking.

Exhibit 2-7a depicts a conceptual site plan for the project site as a whole; Exhibit 2-7b depicts a detailed site plan for the Tracy Alliance parcels only. Table 2-2 summarizes locations and square footage for each project component.

Table 2-2: Proposed Development Summary

Tracy Alliance Parcels (APN 213-170-27, -48)				
Land Use (NEI Specific Plan)		**Total Building Area (gross square feet) (approx.)**	**Total Building Area (gross square feet) (approx.)**	**Total (acres) (approx.)**
Light Industrial (LI)				
Building A	Warehouse	948,500	**978,500**	**22.46**
	Office	30,000

Light Industrial (LI)		1,023,660		

Zuriakat Parcel (APN 213-170-14)	
Land Use (NEI Specific Plan)	**Maximum Building (gross square feet)[2] (approx.)**
Light Industrial (LI)	479,160
Total Maximum Building Gross Square Footage = approx. 3,352,320	

Notes:
APN = Assessor's Parcel Number
FAR = floor area ratio
NEI = Northeast Industrial
[1] The maximum building square footage is calculated from the maximum allowable FAR (50 percent) as set forth in the NEI Specific Plan. The total land area is approximately 2,047,320 square feet (47 acres).
[2] The maximum building square footage is calculated from the maximum allowable FAR (50 percent) as set forth in the NEI Specific Plan. The total land area is approximately 958,320 square feet (22 acres).
Source: Tracy Alliance Group 2020.

Light Industrial

The buildings would support warehouse, distribution and related office uses. Based on the proposed uses described below, it is expected that approximately 1,871 employees would work on-site at full buildout.[9]

Warehouse and Distribution

Multiple warehouse and distribution buildings are proposed, totaling up to 3,352,320 square feet. Three warehouse buildings are proposed on the Tracy Alliance parcels, totaling approximately 1,849,500 square feet. As noted above, because no individual development proposals have been formally submitted as of this writing, the number of buildings and other site planning details of the uses to be constructed on the Suvik Farms parcels and Zuriakat parcel are not currently known. For purposes of analysis in this Draft EIR, it is assumed that buildout on the Suvik Farms parcels and Zuriakat parcel would be to the maximum allowable FAR of 0.5, which provides the most conservative estimate of potential development. Although future occupants/tenants are unknown at this time, the buildings would be utilized for light industrial uses as defined by the NEI Specific Plan, which is most commonly warehouse and distribution operations with low employee densities. Using the maximum FAR allowed, and accounting for applicable setbacks, parking, access, circulation, and landscaping requirements, the Suvik Farms parcels could support up to 1,023,660 square feet of development, while the Zuriakat parcel could support up to 479,160 square feet of development.

Office

Office use is permitted within the Light Industrial (LI) designation under the NEI Specific Plan. Each warehouse/distribution building developed under the proposed project is assumed to include ancillary office space for the purpose of facilitating and administering operations of each building and their respective occupants/tenants.

[9] Conversation between Victoria Lombardo, Senior Planner, and Barbara Harb, Economic Development Analyst, City of Tracy in May 2020. Employment data collected by conversations with business owners for various industrial businesses, including warehousing, manufacturing, and distribution centers, and existing building square footage data, averaged.

Parking

Parking would be provided pursuant to applicable parking requirements of Tracy Municipal Code Chapter 10.08 Article 26. For warehouses, storage buildings, and wholesale industrial, parking spaces must be provided at minimum as follows:

- One space per 1,000 square feet of the first 20,000 square feet of gross floor area; plus
- One space per 2,000 square feet of the second 20,000 square feet of gross floor area; and
- An additional one space per 4,000 square feet of the remaining square feet of gross floor area.

Projects are required to provide bicycle parking based on the required automobile parking. For projects with over 40 required spaces, bicycle parking is required at 5 percent of the automobile spaces. The required automobile and bicycle parking per parcel are shown in Table 2-3.

Table 2-3: Required Parking

Tracy Alliance Parcels (APN 213-170-27 and APN 213-170-48)				
Site Area	**Building A**	**Building B**	**Building C**	**TOTAL**

Zuriakat Parcel (APN 213-170-14)				
Minimum Auto Parking Required	140			
Minimum Bicycle Parking Required	7[1]			
Total Auto Parking Required = approx. 1,153	**Total Auto Parking Provided = approx. 1,550**		**Total Bicycle Parking Required = approx. 591**	

Notes:
[1] Number of spaces is rounded up.
Source: Tracy Alliance Group 2020.

There would be trailer parking provided on the Suvik Farms and Zuriakat parcels, but the count and location of these spaces is not known at this time.

2.4.2 - Proposed Land Use Designation and Zoning

Land Use Designation

General Plan

As described above and shown on Exhibit 2-6, the City of Tracy General Plan designates the project site Industrial. The project site would be annexed into the City of Tracy upon the Local Agency Formation Commission (LAFCo) approval (as shown in Exhibit 2-8a) and detached from the Tracy Rural Fire District; at such time as the reorganization is complete, the current San Joaquin County General Plan designation (A/UR) would no longer apply to the site. Because the project site is already designated Industrial by the City of Tracy General Plan, no land use re-designation (General Plan Amendment) would be required (as shown in Exhibit 2-8a). Primary land uses allowed under this designation consist of flex/office space, manufacturing, warehousing and distribution, and ancillary uses for workers' needs (e.g., restaurants, parks, consumers services, etc.). The maximum FAR is 0.5.[10] The proposed project would be consistent with this Industrial land use designation.

Northeast Industrial Specific Plan

The project site would be incorporated into the NEI Specific Plan area with approval of the proposed amendment to the NEI Specific Plan, and the NEI Specific Plan would be amended to designate the site LI (and any other conforming amendments therein to ensure consistency). Primary land uses allowed within this designation include warehouse and distribution operations with low employee densities. The LI designation also allows for general commercial uses such as automotive supply or plumbing stores.[11] The proposed NEI Specific Plan land use designation is shown in Exhibit 2-8b.

Zoning

The project site is currently zoned General Agriculture with a minimum parcel size of 40 acres (AG-40) by the Ordinance Code of San Joaquin County. Pursuant to applicable State law, the San Joaquin County LAFCo will require the City to pre-zone the project site in conjunction with the proposed annexation. Therefore, the project site would be pre-zoned NEI Specific Plan, which would take effect upon annexation into the City. Allowable uses within this zoning district are governed by the NEI Specific Plan and light industrial uses, as described in the NEI Specific Plan.[12] The proposed zoning is shown in Exhibit 2-8c.

2.4.3 - Circulation and Access

Vehicle

Primary vehicle access to the project site would be provided from four access points on Grant Line Road and four access points on Paradise Road; the northerly access point along Paradise Road would be for Emergency Vehicle Access (EVA) only. Once the future planned I-205 Interchange at Paradise Road is complete (as part of a separate process to be pursued by the relevant public agencies once funding, design and necessary environmental review is completed), the two northmost access points along Paradise Road (including the EVA) would be slightly modified to accommodate the

[10] Design, Community & Environment (prepared for the City of Tracy). 2011. City of Tracy General Plan. February 1.
[11] City of Tracy. 2012. Northeast Industrial Specific Plan. Pages 10-11. July 17.
[12] City of Tracy. 2016. Tracy Municipal Code Section 10.08.3022 – Northeast Industrial Specific Plan. October 18.

interchange. A second EVA may be added along California Avenue to provide emergency access to the Zuriakat parcel; this site planning decision would occur at such time as an individual development proposal is submitted for this parcel.

A new signalized intersection on Grant Line Road would provide access to a New Private Drive that would facilitate on-site circulation for the warehouse and distribution facilities on the Tracy Alliance parcels as well as access to the Suvik Farms and Zuriakat parcels as shown in Exhibit 2-7a. The New Private Drive, located along the Tracy Alliance parcels' eastern boundary, would also provide access to the proposed stormwater detention basin area. Since no individual development proposals (and thus no detailed site plans) are currently being processed on either the Suvik Farms or Zuriakat parcels, the exact location(s) of access points from the New Private Drive to the Suvik and Zuriakat parcels have not been identified at this time.

Future Interchange

The City of Tracy Transportation Master Plan includes improvements to Chrisman Road, which are planned as part of improvements to the City's expressway system, as well as a future I-205/Paradise Road/Chrisman Road interchange as shown in Exhibit 2-7c. The schedule for implementation of the improvements is not known as this time. Though the proposed project would not trigger the need for these improvements, including the interchange, to facilitate and implement the City of Tracy Transportation Master Plan, the proposed project would set aside approximately 12.51 acres in the northwest corner of the project site, which would be sufficient to accommodate the future planned interchange. The proposed project includes annexation of this land into the City, but does not include any design, analysis, or construction of the future planned interchange. Rather, the potential impacts of constructing this future interchange would undergo a separate environmental review process pursuant to the CEQA and NEPA, once funding is programmed and available and once the ultimate design of the interchange is finalized; accordingly, the construction of the interchange is not considered part of the proposed project. Therefore, pursuant to applicable requirements under CEQA, this Draft EIR includes an evaluation of potential impacts of annexing the future interchange area into the City but does not include evaluation of potential impacts from construction and operation of this future interchange.

Off-site Roadway Improvements

The proposed project would include a westbound right-turn lane at the intersection of Grant Line Road and North MacArthur Drive with a right-turn overlap of the signal phase. The proposed project would also include an additional second westbound left turn lane at the intersection of Chrisman Road and Eleventh Street and the signal timing be modified to allow a lagging phase for the eastbound left turn and northbound left turn.

Transit

Bus

The City provides fixed-route bus service (TRACER) within city limits.

San Joaquin Regional Transit District (RTD) provides regional fixed-route bus service within the Stockton Metropolitan Area and greater County.

The closest bus stop to the project site is approximately 0.5 mile west at the intersection of Grant Line Road and North Chrisman Road. The stop is served by San Joaquin RTD County Hopper bus Route 797, connecting to Lathrop, Stockton, and Manteca on weekends.[13] The next nearest bus stop is 1.59 miles to the west at the Shops at Northgate Village. The stop is served by TRACER Route E, connecting to the Tracy Transit Station, and San Joaquin RTD County Hopper bus Routes 90 and 97, connecting to Lathrop and Stockton.[14,15,16]

In addition, Americans with Disability Act (ADA) Paratransit Service by TRACER is a door-to-door service available to City residents that complete a certification for the service and visitors with ADA documentation. The service is designed to serve ADA/Medicare passengers and those 65 and older. The TRACER Paratransit Service area boundary is adjacent to the southern and western project site boundaries.[17]

Rail

The San Joaquin Regional Rail Commission (SJRRC) provides the Altamont Corridor Express commuter rail transit service between Stockton and San José. The Tracy Station is the closest Altamont Corridor Express (ACE) station to the project site, which is located at 4800 South Tracy Boulevard, approximately 4.70 miles southwest of the project site and would provide ACE service to the project site. A westbound train runs in the morning, arriving in Tracy between 4:51 a.m. and 7:36 a.m., Monday to Friday, and between 6:36 a.m. and 9:46 a.m. on Saturdays. An eastbound train runs in the evening, leaving Tracy between 5:11 p.m. and 8:14 p.m. Monday to Friday, and at 5:34 p.m. and 8:54 p.m. on Saturdays.[18] TRACER makes connections with most departures and arrivals, providing transit to the Tracy Transit Station and other stops. However, because of the COVID-19 Pandemic, the 7:11 a.m. and 7:36 a.m. and the 6:11 p.m. and 8:14 p.m. trains have been suspended. In addition, all weekend service has been suspended.

Bicycle

In the project site and vicinity, there is a Class I paved multiuse bicycle path, which is separated from North MacArthur Drive from the I-205 business loop to I-205, spanning approximately 1.8 miles and extending eastward along the northern side of East Pescadero Avenue for less than 0.5 mile.[19] A Class II bicycle lane runs the same length on North MacArthur Drive and ends at the North MacArthur Drive/East Pescadero Avenue intersection. The Class II bicycle lane extends westward on East Pescadero Avenue for approximately 950 feet. There is also a Class II bicycle lane along Grant

[13] San Joaquin Regional Transit District (RTD). 2018. Route 797 Schedule. March 11. Website: http://sanjoaquinrtd.com/route-797/. Accessed April 20, 2020.

[16] San Joaquin Regional Transit District (RTD). 2013. Route 97 Map. August 11. Website: http://www.sanjoaquinrtd.com/maps_and_schedules/GIF/97.gif. Accessed: April 6, 2020.
[17] City of Tracy. 2017. TRACER Paratransit System Map. November 1.
[18] San Joaquin Regional Rail Commission (SJRRC). 2020. Schedules & Fares. Website: https://acerail.com/schedules/. Accessed April 8, 2020.
[19] A Class I bikeway is a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross flow of motorized traffic minimized. (Source: California Department of Transportation. 2018. Highway Design Manual, 6th Edition.)

Line Road from the Joe Pombo Parkway/Grant Line Road intersection that spans approximately 3.80 miles to the east and terminates at the Chabot Court/Grant Line Road intersection.[20,21]

As part of the proposed project's frontage improvements, it is anticipated that the proposed project would construct a Class I path (that would accommodate both pedestrians and bicycles) per the Transportation Master Plan (TMP) for both Grant Line Road and Paradise Road. Pursuant to the applicable parking requirements of Tracy Municipal Code Chapter 10.08 Article 26, the proposed project would provide approximately 59 bicycle parking spaces as described above. Bicycle racks (single-sided or double sided racks, or equivalent) would be located near the office entrances of each building in order to provide for the secured parking of bicycles. The required spaces for bicycle parking would be evenly distributed among the office locations within each building.

Pedestrian

There are existing sidewalks on the southern side of Grant Line Road, extending eastward from the Grant Line Road/East Paradise Road intersection for approximately 0.25 mile. There is also an existing sidewalk on the west side of Paradise Road, running northward from the existing distribution center entrance at 2795 Paradise Road to the Paradise Road/West Pescadero Avenue intersection; existing sidewalks are also located on both sides of East Paradise Road for approximately 0.7 mile from the Grant Line Road/East Paradise Road intersection to just west of the East Paradise Road/North Chrisman Road intersection. Existing sidewalks along both sides of the entirety of Chabot Court provide a pedestrian connection from East Paradise Road to Grant Line Road. There are no sidewalks along California Avenue. As part of the proposed project's frontage improvements, it is anticipated that the proposed project would construct a Class I path (that would accommodate both pedestrians and bicycles) per the TMP for both Grant Line Road and Paradise Road.

2.4.4 - Design, Landscaping, and Lighting

The NEI Specific Plan includes design guidelines and development standards that regulate site planning and architecture within the NEI Specific Plan area. Specific design details are not known at this time, but the proposed project would be required to conform to the applicable design guidelines and development standards set forth in the NEI Specific Plan, subject to review and approval by the City's Development Services Director. Specific regulations set forth in the NEI Specific Plan are provided in Section 3.11, Land Use and Planning.

Building Design and Height

The NEI Specific Plan requires that attention be given to parts of any buildings visible from adjacent roadways or public parking. Large buildings should have facades that include variations in massing, form, and texture. Continuous surface treatments of a single material should be minimized. Architecture should be used to highlight building entries. Any accessory buildings and enclosures, whether attached or detached from the main building, shall be of similar compatible design and

[20] A Class II bike lane is a striped and signed lane for one-way bicycle travel on a street or highway. (Source: Caltrans. 2018. Highway Design Manual 6th Edition.)

[21] City of Tracy Parks and Community Services Department. 2005. City of Tracy Bikeways Master Plan. April.

materials.[22] The proposed buildings would be designed to adhere to these building design standards and guidelines.

The maximum height for LI uses under the NEI Specific Plan is 60 feet. The proposed buildings would not exceed this height.

Landscaping

Within parking areas on-site, landscaping would be required to conform to the applicable requirements for Off-Street Parking established by Municipal Code Chapter 10.08, Article 26, except where modified by the NEI Specific Plan. Landscaping requirements as set forth in the NEI Specific Plan are summarized in Table 2-4. Table 2-4 assumes parking lot landscaping would be decreased by 50 percent, and that a corresponding increase in perimeter landscaping of 50 percent would be provided to compensate, as allowed in the Municipal Code.[23] These requirements include designing landscapes as extensions of adjacent public right-of-way landscaping as applicable and completing on-site landscaping simultaneous to completion of buildings and other improvements. Additionally, landscaping shall not obstruct sight lines at street or driveway intersections, and parking areas and project frontages shall be screened from public rights-of-way.[24] Additional landscaping guidelines are available in the NEI Specific Plan. The proposed project would be designed to adhere to these landscaping development standards and design guidelines.

Table 2-4: Summary of Applicable Landscaping Requirements

Landscaping Requirement	Industrial Use
Landscaped frontage setback	10 feet
Minimum number of trees in parking area	one tree per five spaces
Percentage of landscaping in parking areas for over: 0-15 cars 16-30 cars 31-60 cars Over 60 cars	 5 percent 5 percent 7.5 percent 10 percent
Source: City of Tracy. 2012. Northeast Industrial Specific Plan.	

Lighting and Signage

Light fixtures would be required to meet all applicable safety standards pursuant to the latest adopted edition of the California Building Code and would be installed throughout the length of the New Private Drive and other portions of the project site pursuant to applicable provisions in the Municipal Code. The NEI Specific Plan recommends that one lighting fixture style be used on all streets. Where possible, light standards would be located in roadway medians.[25]

[22] City of Tracy. 2012. Northeast Industrial Specific Plan. Page 32. July 17.
[23] City of Tracy. 2019. Tracy Municipal Code Section 10.08.3560(g).
[24] City of Tracy. 2012. Northeast Industrial Specific Plan. Pages 33 and 34. July 17.
[25] City of Tracy. 2012. Northeast Industrial Specific Plan. Page 24. July 17.

Signage would be required to conform to the applicable requirements of Municipal Code Chapter 10.08, Article 35, except as modified by the NEI Specific Plan. A site sign program would be prepared and integrated into the total design concept for the proposed project, and all signs would be required to be approved prior to installation. Project signage may be illuminated provided that no flashing, traveling, animated, or intermittent illumination would be used. Such illumination would be confined to the area of the sign except when such illumination is back lighting for an otherwise non-illuminated sign. No sign illumination would cast a glare which is visible from any street.

The proposed project would be designed to adhere to these lighting and signage development standards and design guidelines.

2.4.5 - Infrastructure Improvements

Domestic Water

The City, through its Public Works Department, would supply potable water to the proposed project. In the current adopted City Water System Master Plan, 12-inch water lines have been proposed for continuation north on Paradise Road until West Arbor Avenue, and within the project site along the perimeter of the Suvik Farms parcels.[26] The 12-inch water line in Paradise Road has been extended as planned; planned water lines that would traverse through the project site have not yet been installed**.**

The proposed project would install 10-inch lines to accommodate the level of development proposed on the Tracy Alliance parcels. These lines would connect to the buildings on the Tracy Alliance parcels at several locations (as shown in Exhibit 2-9). Several fire hydrants would be installed surrounding the buildings on the Tracy Alliance parcels and would connect to the 10-inch water lines. At such time as individual development proposal(s) for either the Suvik Farms or Zuriakat parcels are formally submitted to the City, then the location and sizing of water lines would be identified and reviewed by the City as part of subsequent engineering plans, which would be required to meet all applicable requirements and standards including those set forth in the then-current adopted City Water System Master Plan .

Stormwater Drainage

The project site drains generally toward the northeast toward I-205 and into Pescadero Irrigation District facilities; this stormwater does not currently enter into a City-maintained facility. There are no existing stormwater drainage facilities on the project site.[27]

The proposed project includes construction of a stormwater detention basin on-site as identified in the current adopted City of Tracy Citywide Storm Drainage Master Plan.[28] The proposed approximately 12.44-acre stormwater detention basin with a pump station would be located along the northeast site boundary. Following its construction, the basin would be dedicated to and managed by the City.

[26] West Yost Associates. 2012. City of Tracy Citywide Water System Master Plan, Figure 8-2 on Page 8-25. December.
[27] Stantec. 2012. City of Tracy Citywide Storm Drainage Master Plan. November.
[28] Stantec. 2012. City of Tracy Citywide Storm Drainage Master Plan. Figure 5-1a. November.

The proposed stormwater detention basin would be in the northern portion of the project site, along the terminus of California Avenue, and would connect to the City's proposed NEI detention basin west of the project site (see Exhibit 3.10-1). It is anticipated that the NEI detention basin would be completed prior to operation of any buildings on the project site and would therefore accept stormwater from the proposed project.

Following Phase 1 (Tracy Alliance parcels), each subsequent applicant for its respective individual development proposal within the project site would be required to confirm that the proposed project's on-site stormwater detention basin and bioretention treatment areas could accommodate project flows to the satisfaction of the City and that post-development stormwater flow rates would not substantially exceed predevelopment rates pursuant to the applicable C.3 requirements. The proposed project's on-site stormwater detention basin would be required to comply with applicable provisions of the Multi-Agency Post-Construction Stormwater Standards Manual which identifies BMPs to control the potential pollutant load of stormwater runoff. Additionally, Chapter 11.32 of the Municipal Code requires each applicant for its respective individual development proposal within the project site to pay applicable stormwater impact fees in connection with their respective development proposals, which would ensure the operation, maintenance, and replacement of existing and future stormwater facilities. Each applicant for its respective individual development proposal within the project site would be required to prepare a clearly defined Operations & Maintenance (O&M) Plan in connection with its respective individual development proposal to ensure that installed stormwater treatment measures and hydromodification management controls are inspected and properly operated and maintained for the life of the relevant individual development proposal.

The proposed project would construct a 12-inch forced main storm drain line along the corner of I-205 east and Paradise Road (see Exhibit 2-9, Exhibit 2-10a and 2-10b) to connect the proposed on-site detention basin to the City's NEI detention basin (Exhibit 3.10-1) adjacent to the western boundary of the project site. Project discharge into the on-site detention basin would be held until the NEI detention basin is drained enough to accept inflow; all stormwater would eventually discharge into the Eastside Channel.

Bioretention treatment areas would intermittently surround the buildings on the Tracy Alliance parcels and be interspersed throughout the parking lots (Exhibit 2-10b); similar features are anticipated for the remaining portions of the project site, although the design of these improvements would be finalized when individual development proposals for the remainder of the project site are submitted to the City. On-site storm drain lines within the Tracy Alliance parcels would be 12 inches and would connect bioretention treatment areas to the proposed on-site detention basin; similar features are anticipated for the remaining portions of the project site, although the design of these improvements would be finalized when individual development proposals for the remainder of the project site are submitted to the City.

Sanitary Sewer

The proposed project would include connections to the existing City sanitary sewer system operated by the Public Works Department via the existing wastewater line beneath Paradise Road (see Exhibit

2-9).[29] An existing 15-inch sanitary sewer line is located within the Paradise Road right-of-way and an existing 10-inch sanitary sewer line is located within Grant Line Road and have sufficient capacity to accommodate the development as proposed. Based on the relevant site plan submitted in connection with the individual development proposal for the Tracy Alliance parcels, these lands would be served as follows:

- **Building A:** would be served via two proposed 8-inch sanitary sewer lines that would each connect to the existing 15-inch sanitary sewer line in Paradise Road.
- **Building B:** would be served by a proposed 6-inch sanitary sewer line that would traverse the northern side of Building A, connecting to the existing 15-inch sanitary sewer line in Paradise Road.
- **Building C:** would be served by two sanitary sewer lines: (1) a proposed 6-inch sanitary sewer line that would connect to an existing 10-inch sanitary sewer line in Grant Line Road, and (2) a proposed 8-inch sanitary sewer line that would connect to the existing 15-inch sanitary sewer line in Paradise Road.

Since no individual development proposals (and thus no site plans) have been submitted to the City for the Suvik Farms and Zuriakat parcels as of this writing, the exact location and sizing of an on-site sanitary sewer system for the development to occur on these lands are not currently known. However, this information would be identified and reviewed by the City of Tracy as part of subsequent engineering plans when applications for their respective individual development proposals are submitted for these parcels, which would be required to meet all applicable requirements and standards.

Solid Waste and Recycling Collection

The City, through its Public Works Department, provides solid waste and recycling services for areas within city limits and certain surrounding County areas. The Public Works Department has a partnership with Tracy Disposal Service Company to provide residential and commercial solid waste collection and disposal, including recycling and organics services.[30,31] Garbage is collected once a week, and recycling and yard waste are collected on alternating weeks.[32]

Solid waste generated by the proposed project would be accommodated at the Tracy Material Recovery Facility & Solid Waste Transfer (MRF), and then hauled to the Foothill Sanitary Landfill on North Waverly Road east of Tracy. On a designated day, Tracy Disposal Service Company collects and transports solid waste to the MRF.

[31] Tracy Delta Solid Waste Management, Inc. Website: https://www.tdswm.com/. Accessed April 9, 2020.
[32] City of Tracy. 2020. Garbage & Recycling Schedule. Website: https://www.ci.tracy.ca.us/?navId=700. Accessed April 16, 2020.

Power and Telecommunications

Electricity and natural gas services for the proposed project would be provided by Pacific Gas and Electric Company (PG&E). There is a natural gas pipeline under Grant Line Road, as well as an aboveground electric transmission line.[33,34]

Phone and internet services could be provided by various private companies, including AT&T, Xfinity Comcast, and Verizon.

2.4.6 - Phasing and Construction

The proposed project would include construction of multiple buildings in approximately three phases over a period of approximately 36 months (three years) starting in April 2022 and ending in April 2025. The phasing would happen per parcel as shown in Table 2-5:

Table 2-5: Phasing and Construction

Activity	Start Date	End Date
Phase 1 (Tracy Alliance parcels)		
Site Improvements	4/2022	12/2022
Building(s) Constructed	9/2022	3/2023
Operations	4/2023	N/A
Phase 2 (Suvik Farms parcels)		
Site Improvements	4/2023	12/2023
Building(s) Constructed	9/2023	3/2024
Operations	4/2024	N/A
Phase 3 (Zuriakat parcel)		
Site Improvements	4/2024	12/2024
Building(s) Constructed	9/2024	3/2025
Operations	5/2025	N/A
Notes: The timing for commencement of construction was based on available information at the time that environmental review commenced. To the extent construction commences later than assumed, this Draft EIR reflects a conservative analysis given that technological advances and more stringent regulations governing air quality and greenhouse gas (GHG) emission impacts would be anticipated to further decrease emissions. Source: Tracy Alliance Group 2020.		

[33] Pacific Gas and Electric Company (PG&E). 2020. Gas Transmission Pipelines. Website: https://www.pge.com/en_US/safety/how-the-system-works/natural-gas-system-overview/gas-transmission-pipeline/gas-transmission-pipelines.page. Accessed April 9, 2020.

[34] California Energy Commission. California Electric Infrastructure App. Website: https://cecgis-caenergy.opendata.arcgis.com/app/ad8323410d9b47c1b1a9f751d62fe495. Accessed April 9, 2020.

However, for purposes of a conservative analysis, this Draft EIR considers both sequential and concurrent phasing options for the proposed project, as detailed more fully in Section 3.3, Air Quality, and Section 3.8, Greenhouse Gas Emissions.

Approximately 500,000 cubic yards of material would be cut and rebalanced across the entire site as part of the three phases of development. As specific construction schedules and detailed information for the development of the Suvik and Zuriakat parcels is not known at this time, conservative default assumptions were used for the purpose of analyzing and modeling potential construction durations and equipment for the proposed project.

2.5 - Required Actions and Approvals

The following discretionary approvals and permits are required by the City for implementation of the proposed project**:**

- EIR Certification
- Pre-zoning to Northeast Industrial Specific Plan
- Northeast Industrial Specific Plan Amendment
- Development review permit(s)
- Tentative Parcel Map or Lot Line Adjustment(s) as needed to create final development lots
- Resolution of City Initiation of Reorganization Proceedings
- Cancellation of the Williamson Act Contract on the Suvik Farms parcels (if required)

In addition, the ministerial actions by the City for implementation of the proposed project may include, but are not limited, to the following:

- Demolition permits
- Grading permits
- Building permits
- Certificates of occupancy

In addition to the City, several other agencies will serve as Responsible and Trustee Agencies, pursuant to CEQA Guidelines Section 15381 and Section 15386, respectively. This Draft EIR provides environmental information that may be required to grant approvals or to support coordination with other agencies as part of project implementation. These agencies may include, but are not limited to, the following:

- United States Army Corps of Engineers
- United States Fish and Wildlife Service
- California Department of Fish and Wildlife
- California Department of Transportation
- California Public Utilities Commission
- Central Valley Regional Water Quality Control Board
- County of San Joaquin
- San Joaquin Local Agency Formation Commission

Discretionary and ministerial actions by other agencies that are necessary to implement the proposed project may include the following:

- Approval of proposed reorganization to accomplish the annexation of the project site into the City of Tracy (San Joaquin LAFCo) and detachment of the project site from Tracy Rural Fire District (San Joaquin LAFCo)
- Coverage under General Construction Stormwater Permit (California State Water Resources Control Board/Central Valley Regional Water Quality Control Board)
- Approval of Indirect Source Review (San Joaquin Valley Air Pollution Control District)
- Issuance of Encroachment Permits for roadway or utility improvements within facilities under the jurisdiction of the California Department of Transportation (Caltrans) or the County of San Joaquin may also be necessary.

2.6 - Intended Uses of This Draft EIR

This Draft EIR has been prepared by the City to assess the potential environmental impacts that may arise in connection with actions necessary to implement the proposed project. Accordingly, consistent with the CEQA mandate that prefers finality and seeks to avoid additional unnecessary environmental review, once this EIR is certified by the City Council, it is anticipated that it will be utilized to provide CEQA coverage for future discretionary actions, entitlements and permits considered by the City as well as other public agencies that have discretionary authority over certain aspect(s) of the proposed project to the maximum extent permitted under all applicable laws and regulations including, without limitation, CEQA Guidelines Section 15162, 15164 and/or 15183.

This document will also serve as a basis for soliciting comments and input from members of the public, other interested organizations, and public agencies regarding the proposed project. The Draft EIR will be circulated for 45 days, during which period comments concerning analysis contained in the Draft EIR should be sent to:

CHAPTER 3: ENVIRONMENTAL IMPACT ANALYSIS

This Chapter sets forth the physical and regulatory environmental setting and addresses the organization of the discussion of the environmental impacts of the Tracy Alliance Project (proposed project) with respect to 17 environmental resource areas. The discussions of the environmental setting describe present physical conditions, or baseline conditions, on the project site and in the vicinity. For purposes of this analysis, the baseline used for the evaluation of environmental impacts under the California Environmental Quality Act (CEQA) reflects the conditions present at the time the Notice of Preparation (NOP) for this Draft Environmental Impact Report (Draft EIR) was published. To determine the proposed project's individual impacts, potential impacts of the proposed project are compared against the existing baseline conditions for each environmental resource. For purposes of the cumulative analysis, the impacts of the proposed project in combination with other past, present, and reasonably foreseeable future projects are analyzed to determine whether overall long-term impacts of all such projects would be cumulatively significant, and to determine whether the proposed project itself would cause a "cumulatively considerable" incremental contribution to any such cumulatively significant impacts.

Environmental Topics Addressed in this Draft EIR

The project is analyzed in this EIR from the perspective of the following 17 environmental resource areas:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

Format of the Environmental Analysis

Each resource area analyzed in this Draft EIR includes the subsections summarized below.

Introduction

This subsection summarizes what is discussed in the respective environmental topic section, states what informational documents are used as the basis for the section, and indicates what related comments, if any, were received during the Draft EIR public scoping period.

Environmental Setting

This subsection describes existing, baseline physical conditions of the project site and the surroundings (e.g., existing land uses, transportation conditions, noise environment) with respect to each resource topic at the time the NOP was issued. Conditions are described in sufficient detail and breadth to allow a general understanding of environmental impacts of the proposed project based on reasonably available information.

Regulatory Framework

This subsection describes relevant federal, State, regional (if applicable), and local regulatory requirements that are directly applicable to the environmental topic being analyzed.

Impacts and Mitigation Measures

This subsection evaluates potential for the proposed project to result in direct and indirect adverse impacts on the existing physical environment, with consideration of both short-term and long-term impacts. The analysis covers construction and operation of the proposed project. The City is utilizing Appendix G of the State CEQA Guidelines as thresholds of significance for this project. The significance thresholds for environmental impacts are defined at the beginning of this subsection, and the discussion of the approach to the analysis explains how significance thresholds have been applied to evaluate impacts of the proposed project.

Indirect impacts are discussed only for those resources for which they have potential to occur (e.g., cultural resources, air quality, and biological resources). Both individual-level and cumulative impacts are analyzed. Individual-level impacts could result from actions related to implementation of the proposed project as compared to the existing, baseline conditions. Cumulative impacts could result from implementation of the proposed project in combination with other cumulative projects in the relevant study area. As discussed in "Cumulative Impacts," below, the projects listed in Table 3-1, in conjunction with the proposed project, are considered the cumulative scenario for analysis of cumulative impacts.

Impacts are analyzed and the respective assessment and findings are included in this Draft EIR, applying the following levels of significance:

- **No Impact.** A conclusion of No Impact is reached if no potential exists for impacts or if the environmental resource does not occur in the project site or the relevant study area of potential impacts.
- **Less than significant impact.** This determination applies if the impact does not exceed the defined significance criteria or would be eliminated or reduced to a less than significant level through compliance with existing local, State, and federal laws and regulations. No mitigation is required for impacts determined to be less than significant.
- **Less than significant impact with mitigation.** This determination applies if the proposed project would result in a significant impact, exceeding the established significance criteria, but feasible mitigation is available that would reduce the impact to a less than significant level.

- **Significant and unavoidable impact.** This determination applies if the proposed project would result in an adverse impact that exceeds the established significance criteria, and no feasible mitigation is available to reduce the impact to a less than significant level. Therefore, the residual impact would be significant and unavoidable.

Impacts are defined in terms of their context and intensity. Context is related to the uniqueness of a resource; intensity refers to severity of the impact. Where applicable, Best Management Practices (BMPs), project improvement measures (otherwise referred to as project design features), or both, are incorporated into the proposed project to limit potential for a significant impact. Where necessary, feasible mitigation measures are identified for significant impacts to limit the degree or lower the magnitude of the impact; rectify the impact by repairing, rehabilitating, or restoring the affected environment; or compensate for the impact by replacing or providing substitute resources or environments. These impacts conclude with a finding of *Less than significant impact with mitigation*. Where no mitigation measures are necessary, relevant impacts are concluded to be *Less than significant* or to have **No impact.**

As part of the impact analysis, mitigation measures are identified, where feasible, for impacts considered significant or potentially significant consistent with CEQA Guidelines Section 15126.4, which states that an EIR "shall describe feasible measures which could minimize significant adverse impacts." CEQA requires that mitigation measures have an essential nexus and be roughly proportional to the significant impact identified in the EIR. The project sponsor may be required to implement all identified mitigation measures identified in this Draft EIR, as reflected in an adopted Mitigation Monitoring and Reporting Program (MMRP) and the lead agency (in this case, the City of Tracy) is responsible for overseeing the project sponsor's implementation of mitigation measures, which occurs through the imposition of the MMRP as enforceable conditions of approval. Pursuant to CEQA Guidelines Section 15126.4, mitigation measures are not required for environmental impacts that are found not to be significant.

Impacts are numbered and shown in bold type. The corresponding mitigation measures, where identified, are numbered, indented, and follow the impact statements. Impacts and mitigation measures are numbered consecutively within each topic and include an abbreviated reference to the impact section (e.g., "LAND" for Land Use and Planning). The following abbreviations are used for individual topics:

- Aesthetics (AES)
- Agriculture and Forestry Resources (AG)
- Air Quality (AIR)
- Biological Resources (BIO)
- Cultural Resources (CUL)
- Energy (ENER)
- Geology and Soils (GEO)
- Greenhouse Gas Emissions (GHG)
- Hazards and Hazardous Materials (HAZ)
- Hydrology and Water Quality (HYD)

- Land Use and Planning (LAND)
- Noise (NOI)
- Public Services (PUB)
- Transportation (TRANS)
- Utilities and Service Systems (UTIL)
- Tribal Cultural Resources (TCR)
- Wildfire (WILD)

Cumulative Impacts

The discussion of cumulative impacts in this subsection analyzes cumulative impacts of the proposed project, taken together with other past, present, and reasonably foreseeable future projects producing related impacts. The goal of this analysis is to determine whether overall long-term impacts of all such projects would be cumulatively significant, and to determine whether the proposed project itself would cause a "cumulatively considerable" incremental contribution to any such cumulatively significant impacts. To determine whether the overall long-term impacts of all such projects would be cumulatively significant, the analysis generally considers the following:

- The area in which impacts of the proposed project would be experienced;
- The impacts of the proposed project that are expected in the area;
- Other past, proposed, and reasonably foreseeable projects that have had or are expected to have impacts in the same area;
- The impacts or expected impacts of these other projects; and
- The overall impact that can be expected if the individual impacts from each project are allowed to accumulate.

"Cumulative impacts" refers to two or more individual impacts that, when considered together, are considerable, or that compound or increase other environmental impacts (CEQA Guidelines § 15355). Cumulative impacts can result from individually minor but collectively significant impacts taking place over time (40 Code of Federal Regulations [CFR] § 1508.7). This analysis will determine whether the potential exists for the proposed project, taken together with other past, present, and reasonably foreseeable future projects, would result in a significant or adverse cumulative impact. This analysis would then determine whether the proposed project's incremental contribution to any significant cumulative impact is itself significant (i.e., "cumulatively considerable"). Both conditions must apply for the project's cumulative effects to rise to the level of significance.

The cumulative impact analysis for each individual resource topic is presented in each resource section of this Chapter immediately after the description of direct project impacts and identified mitigation measures.

In addition to relevant past and present cumulative projects, Table 3-1 lists relevant cumulative projects considered for the environmental analysis and Exhibit 3-1, Cumulative Projects Map, shows

the locations of the cumulative projects. The cumulative projects list includes past, present, and future projects. Future projects include pipeline projects that are considered reasonably foreseeable.

Table 3-1: Cumulative Projects

No.	Project	Characteristics	Project Development			
			Units	Square Footage	Location	Status
City of Tracy						
1	Home2 Suites Hotel	Highway Commercial Hotel	94	67,230	2025 West Grant Line Road	Operational

Exhibit 3-1
Cumulative Projects Map

THIS PAGE INTENTIONALLY LEFT BLANK

3.1 - Aesthetics

3.1.1 - Introduction

This section describes the existing aesthetics, light, and glare setting and potential environmental effects from project implementation on visual resources on the site and its surroundings. Descriptions and analyses in this section are based, in part, on on-site reconnaissance and a photo inventory by FirstCarbon Solutions (FCS) personnel and review of the City of Tracy General Plan (General Plan), City of Tracy Municipal Code (Tracy Municipal Code), and the City of Tracy Northeast Industrial (NEI) Specific Plan.

3.1.2 - Environmental Setting

Visual Character

Visual character in the California Environmental Quality Act (CEQA) context is an impartial description of defining physical features, landscape patterns, and distinctive physical qualities within a landscape. Visual character is informed by the composition of land, vegetation, water, and structures and their relationship (or dominance) to one another, and by prominent elements of form, line, color, and texture that combine to define the composition of views. Visual character-defining resources and features within a landscape may derive from notable landforms, vegetation, land uses, building design and façade treatments, transportation facilities, overhead utility structures and lighting, historic structures or districts, or panoramic open space.

City of Tracy

The City of Tracy (City) is located in San Joaquin County, east of the Coastal Range that separates California's Central Valley from the San Francisco Bay Area. The City lies east of the Mount Diablo Meridian and covers approximately 22 square miles. It is surrounded generally by agricultural, industrial, and rural and suburban residential uses.

The City is in the San Joaquin Valley, between the Sierra Nevada Mountains to the east and the Diablo Range to the west. Substantial portions of the valley floor are developed with residential, agricultural, and industrial facilities. Its visual urban form consists of several distinct segments, including Tracy's downtown, traditional residential neighborhoods, contemporary residential subdivisions, retail and commercial areas, industrial areas, parks and landscaping, and agricultural lands.

Project Site

The project site is generally flat and is currently comprised of cultivated fields, with associated irrigation/drainage channels. A portion of the project site is currently occupied by several existing residences and agricultural structures, all of which are located in the southwest corner of the site. Ruderal vegetation and ornamental trees associated with the existing structures are present. Several private dirt roads bisect the site providing access to the crop fields. Irrigation/drainage channels run along all of the private dirt roads within the project site (see Exhibit 3.1-1 in Section 3, Biological Resources).

Scenic Resources

Scenic resources typically involve prominent, unique, and identifiable natural features in the environment (e.g., trees, rock outcroppings, islands, ridgelines, channels of water, and aesthetically appealing open space), and/or cultural features or resources, such as regional or architecturally distinctive buildings or structures that serve as a focal point of interest.

City of Tracy

The City of Tracy General Plan identifies the following scenic resources within the Tracy Planning Area:

- **Views of the Diablo Range**. Rising from the southwest portion of the Tracy Planning Area, this range extends from near sea level to 1,652 feet and provides a visual barrier between the Central Valley and the San Francisco Bay Area. Generally, the eastern slopes visible from Tracy have not been developed and contain sporadic tree groupings.
- **Natural landscapes surrounding the Paradise Cut, Old River, and Tom Paine Sloughs**. Located on the north side of the Tracy Planning Area, these landscapes contain streamside vegetation that provide visual contrasts as they run through the relatively flat agricultural lands.
- **Expansive Agricultural Lands**. The surrounding Sphere of Influence (SOI) and Planning Area contain agricultural lands that are used for row crops and grazing.
- **Hillside Areas**. Hillside areas, located on the southwestern side of the City to the west of Interstate 580 (I-580), including in the Tracy Hills Specific Plan area, are a visual amenity for residents of the City and travelers on I-580.

There are two officially designated California Scenic Highway segments in the Tracy Planning Area, covering approximately 16 miles. The first segment is the portion of I-580 between I-205 and I-5, which offers views of the Coast Range to the west and the Central Valley's urban and agricultural lands to the east. The second segment is the portion of I-5 that starts at I-205 and continues south to Stanislaus County, which allows for views of surrounding agricultural lands, the Delta-Mendota Canal, and the California Aqueduct.[1] These segments are shown in Exhibit 3.1-1.

A visual landmark or entryway, as defined by the General Plan, is an element by which people orient themselves and can help create a unique identity for an area. Examples of visual landmarks include statues, major works of public art, historic buildings, water towers, significant landscaping or landforms, and other easily identifiable features.

The City of Tracy provides entrances to the City from major roadways called "entry corridors" or "gateways." These scenic corridors are important for providing both visitors and residents with initial impressions of Tracy and also providing a transition from a rural to urban environment. The City's existing gateways include exits from I-205 at MacArthur Drive, Tracy Boulevard, Grant Line Road and Eleventh Street, and also include exits from I-580 at Lammers Road and Corral Hollow Road. The entry corridors are shown on Exhibit 3.1-1.

[1] California Department of Transportation (Caltrans). 2019. California State Scenic Highway. List of Eligible and Officially Designated State Scenic Highways. August.

Project Site

The project site is adjacent to the current boundaries of the NEI Specific Plan area, which is primarily characterized by light industrial uses such as warehouse and logistic facilities, as well as agricultural uses. Hillside areas and views of Diablo Range are visible from the project site and the project site contains expansive agricultural lands. There are no City entry corridors or gateways, or State Scenic Highways on, or adjacent to, the project site; however, views of the project site are visible from one of the entry corridors identified in the General Plan, the eastbound exit from I-205 off MacArthur Drive. The nearest designated California Scenic Highway is the portion of I-580 between I-205 and I-5, which is approximately 7.2 miles east of the project site.

Views

Views may be generally described as panoramic views of a large geographic area for which the field of view can be wide and extend into the distance. Associated vantage points provide an orientation from publicly accessible locations. Examples of distinctive views include urban skylines, valleys, mountain ranges, or large bodies of water.

City of Tracy

The Diablo Range, rising to an elevation of nearly 1,652 feet, is the most prominent topographical feature in the area.

Project Site

In April 2020, FCS conducted a field visit to observe and document existing visual quality and character of the project site and vicinity. As shown in Exhibits 2-4a through 2-4e in Chapter 2, Project Description, the area surrounding the project site has both an agricultural and industrial character, with neighboring properties south and west of the project site consisting of agricultural lands and industrial warehouses. Land uses north of California Avenue consist of single-family homes and a cell tower located immediately east of the terminus of California Avenue. In addition, urban development such as a vehicle dealership is located to the north, across I-205. East of the project site is agricultural land with associated single-family homes and agricultural structures and outbuildings. To the west are vacant lots interspersed among the agricultural and industrial lands. Views from the project site north are of single-family homes and I-205; views to the west are of industrial buildings and undeveloped land; views to the south are of industrial buildings, single-family homes, and open space; and view to the east are single-family homes and undeveloped land.

Light and Glare

In the context of CEQA, light is nighttime illumination that stimulates sight and makes things visible; glare may be defined as difficulty seeing in the presence of bright light, such as direct or reflected sunlight.

Project Vicinity

The primary sources of nighttime light in the surrounding area are from vehicle headlights traveling along I-205 and Grant Line Road, as well as other surrounding roadways. There are also streetlights and buildings with outdoor security lighting in the project vicinity. There are some large reflective surfaces associated with buildings in the project vicinity that contribute daytime glare.

Project Site

The few residences and agricultural structures on-site may include exterior nighttime lighting; however, such lighting is minimal. There are streetlights surrounding the project site on Grant Line Road and Paradise Road. There are also lights on I-205. There are some outdoor lighting fixtures on adjacent industrial buildings. No other features on the project site produce light or glare.

3.1.3 - Regulatory Framework

State

California Scenic Highway Program

The California Scenic Highway Program is intended to preserve and protect scenic highway corridors from change that would diminish aesthetic value of highway lands. A highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, scenic quality of the landscape, and the extent to which development intrudes upon travelers' enjoyment of the view. A scenic corridor is land generally adjacent to and visible from the highway and is identified using a motorist's line of vision. The corridor protection program seeks to encourage quality development that does not degrade scenic value of corridors. Minimum requirements for scenic corridor protection include:

- Regulation of land use and density of development
- Detailed land and site planning
- Control of outdoor advertising (including a ban on billboards)
- Careful attention to and control of earthmoving and landscaping
- Careful attention to design and appearance of structures and equipment

Title 24 of the California Code of Regulations Building Energy Efficiency Standards

California Building Code (California Code of Regulations [CCR], Title 24)—including Title 24, Part 6—includes Section 132 of the Building Energy Efficiency Standards, which regulates lighting characteristics, such as maximum power and brightness, shielding, and sensor controls to turn lighting on and off. Different lighting standards are set by classifying areas by lighting zone. The classification is based on population figures of the 2000 Census. Areas can be designated as LZ1 (dark), LZ2 (rural), or LZ3 (urban). Lighting requirements for dark and rural areas are stricter, to protect the areas from the introduction of new sources of light pollution and light trespass.

Local

City of Tracy General Plan

The Tracy General Plan establishes the following goals and policies related to aesthetics, light, and glare that are relevant to this analysis:

Land Use Element

Goal LU-1. A balanced and orderly pattern of growth in the City.

Objective LU-1.1. Establish a clearly defined urban form and city structure.

Policies

Policy P1 New development and redevelopment in existing areas shall be organized as a series of residential neighborhoods, Employment Areas, Corridors, Village Centers, the Downtown and the I-205 Regional Commercial Area. Each is defined as follows:

- Neighborhoods are residential areas of the city that are approximately ½ mile in diameter and centered on a focal point such as a park, school, or public open space.
- Employment areas are the job-centers of the city and include office districts, retail centers and industrial areas.
- The Downtown provides a focal point of community life in the City and contains a mix of uses including commercial, residential, public facilities and community services.
- Village Centers are retail areas that may contain a mix of uses, such as housing and office uses. These areas serve several neighborhoods and are designed to be walkable, main streets.
- Corridors refer to several arterial streets, each with a mix of uses.
- The I-205 Regional Commercial Area is a special district north of I-205 that contains big-box retail, automobile sales establishments and a large, regional shopping mall.

Community Character Element

Goal CC-1. Superior design quality through Tracy.

Objective CC-1.1. Preserve and enhance Tracy's unique character and "hometown feel" through high-quality urban design.

Policies

CC-1.1 P1 Preserving and enhancing hometown feel shall be the overriding design principle for the City of Tracy.

CC-1.1 P3 All new development and redevelopment shall adhere to the basic principles of high-quality urban design, architecture and landscape architecture including, but not limited to, human-scale design, pedestrian-orientation, interconnectivity of street layout, siting buildings to hold corners, entryways, focal points, and landmarks.

CC-1.1 P4 To the extent possible, site layout and building design should take into account Tracy's warm, dry climate, such as through the inclusion of trees and landscaping or other architectural elements to provide shade.

CC-1.1 P5 Lighting on private and public property should be designed to provide safe and adequate lighting, while minimizing light spillage to adjacent properties.

Objective CC-1.2: Balance the need for growth with the preservation of Tracy's "hometown feel."

Policies

CC-1.2 P1 New development projects shall be approved only if they meet the design principles set forth in the Community Character Element and in detailed design guidelines approved by the City Council.

Objective CC-1.4. Minimize the use of sound walls in Tracy.

Policies

CC-1.4 P3 Sound walls or solid fences along streets other than arterials and expressways should be used only if no other design solutions exist for reduction the impact of roadway noise on residential areas.

CC-1.4 P4 Where sound walls are used, they shall be set back from the street, include design features that enhance visual interest and be landscaped in order to mitigate their impact on urban character and the pedestrian environment.

Objective CC-1.5. Provide underground utilities throughout Tracy.

Policies

CC-1.5 P1 New development shall allocate and construct utilities underground.

Goal CC-4. An enhanced identity through preservation of open space at the City's periphery and appropriate transitions between urban development and non-urban areas.

Objective CC-4.1: Create appropriate edges to the urbanized area.

Policies

CC-4 P1 Strongly oppose the urbanization within the City of Tracy's Planning Area as defined by this General Plan or the San Joaquin County General Plan, whichever is more restrictive, particularly between the City of Tracy and the adjacent communities of Mountain House and Lathrop.

CC-4 P2 To the extent feasible, the City shall use land designations and open space preservation techniques to create appropriate transitions. A variety of techniques can be used to create the soft or hard edges to the City including the following:

- **Buffer Zone.** Soft edges can be created with buffer zones such as natural open space, large setbacks, and landscaped areas, as a means to separate urban from rural uses. Buffer areas shall be planted and maintained by the property owner, tenants or homeowner's association and may include passive and active recreation areas such as picnic areas, bridle, and walking trails. Golf course development may also be an option in areas where a soft edge is desired.
- **Cluster Development.** Clustered development is a method of site planning in which structures are clustered on a given site in the interest of preserving open space or creating a buffer. Areas with clustered development typically have low gross

residential densities and high minimum open space requirements to encourage the clustering of structures.

- **Feathering of Density:** A gradual reduction in residential density can be used to establish a smooth transition between urban and rural uses.

CC-4 P3 The City shall encourage the location of new parks around the edge of the SOI to help create and support a soft edge to the city.

Goal CC-11. Well-designed Employment Areas that are integrated with other parts of Tracy.

Objective CC-11.1: Ensure that Employment Areas are developed with a recognizable identity and structure.

Policies

CC-11.1 P1 Employment Areas should contain one or more focal points such as a retail use, park, or plaza.

CC-11.1 P2 Focal Points in Employment Areas may be located on private or public property and are encouraged to be publicly accessible.

CC-11.1 P3 Development within an Employment Area should occur such that a majority of business parks or office parks are within a reasonable walking or biking distance, generally ½ mile, of one or more focal points.

Objective CC-11.2. Encourage attractive design in Employment Areas.

Policies

CC-11.2 P1 Development in Employment Areas should adhere to high-quality design standards.

CC-11.2 P4 Building setbacks for office buildings or office portions of industrial buildings should be minimized to ensure that buildings define the edges of the street.

CC-11.2 P5 Building facades in Employment Areas should provide visual interest.

CC-11.2 P6 Loading facilities in Employment Areas should be screened from view from public streets to the extent possible.

CC-11.2 P7 Individual projects in Employment Areas shall provide adequate buffers to adjacent residential areas.

CC-11.2 P8 Fencing on industrial and commercial sites at the front property line shall be discouraged, except when necessary for security or noise attenuation.

CC-11.2 P9 Fencing visible from the public right-of-way shall be visually appealing when used in industrial and commercial developments.

Objective CC-11.3. Minimize the impact of parking on the pedestrian environment in the Employment Areas.

Policies

CC-11.3 P1 The impact of parking in Employment Areas on the pedestrian environment should be minimized with attractive landscaping.

CC-11.3 P2 Parking lots should be set back from the street with a landscaped buffer wherever possible.

CC-11.3 P3 Parking for alternative modes of transportation, such as preferential parking for carpool/vanpool, motorcycles or alternative fuel vehicles and bicycles, should be incorporated into parking plans for development projects in Employment Areas.

Northeast Industrial Specific Plan

The NEI Specific Plan establishes design guidelines and development standards for projects within its boundaries. For Light Industrial (LI) uses, this includes a maximum floor area ratio (FAR) of 0.5 and a maximum building height of 60 feet. Other applicable design guidelines are included below.

Streetscapes

- The design of the streetscape should integrate, in a consistent and creative manner, plant materials, paths, berming, lighting, and signage to produce an attractive and functional environment.
- All landscaping should employ a mix of trees, shrubs, groundcovers and turf, where appropriate. The plant palette should be relatively limited and applied in groupings of similar species rather than a few plants of many different species planted together. The use of water conserving plantings, such as California natives and drought tolerant trees, shrubs, and turf is encouraged, and compliance with the state's water efficient landscape guidelines is required.
- The use of lawn substitutes is encouraged in all medians and for parkways. The use of turf should be minimized and reserved for areas of high use or visibility and temporary median planting in anticipation of future street widths.
- Automatic irrigation is required for all landscape areas. Plants should be watered and maintained on a regular basis. Irrigation systems should be designed so as not to overspray walks, buildings, and parking areas, etc. The use of water conserving systems, such as drip irrigation for shrub and tree planting, is encouraged.
- Tree plantings should reflect street hierarchy with larger trees along arterial streets and smaller trees on industrial streets. Tree plantings shall be symmetrical and of the same species in the parkways on both sides of the streets. One tree species or mixture of species shall be planted consistently at regular intervals along the entire length of a street. Spacing interval shall be no greater than 40 feet on center. Where trees are planted in medians, the plantings shall be continuous and at regular intervals. Spacing of median trees shall be no greater than 30 feet on center. Different tree species shall be planted at intersections to highlight these areas.
- Adequate sight lines shall be maintained at all times.

Street Lighting

- Illumination standards for arterial and industrial streets should reflect the different right-of-way widths and functions.
- Light fixtures and standards shall meet all safety standards and shall be employed throughout the length of the street. It is recommended that one lighting fixture style be employed for use on all streets. Where possible, light standards shall be located in medians.

Building Setbacks

- Building setback from any property line adjacent to a street or Caltrans right-of-way shall be 25 feet minimum. Rear and side yard building setbacks from property lines not adjacent to a street or Caltrans right-of-way shall be 15 feet minimum.
- A 5-foot-wide landscape setback is required along property lines not adjacent to a right-of-way. On the property lines perpendicular to the street frontage on industrial streets, the landscaped setback is only required to a point 150 feet onto the parcel from the street right-of-way or 50 feet back of building face, whichever is greater.
- Parking setback from any property line along a public street of the Caltrans right-of-way for commercial land uses shall be 10 feet and for industrial land uses shall be 15 feet.
- Parking shall not be permitted within 10 feet of the building entry face of any commercial structure. In the event the building has an arcade or other shade structure along this frontage, the structure can be located within this required setback. Parking shall not be permitted within 15 feet of the office face or portion of a building. On industrial buildings, a 15 foot setback to the parking area shall be provided at building entries.

Loading and Unloading Spaces

- Sufficient off-street loading and unloading spaces shall be provided on each site, and adequate provisions and space shall be made for maneuvering freight vehicles and handling all freight. All loading activity, including turnaround and maneuvering, shall be made on-site.
- In industrial areas, truck loading areas and docks shall not be permitted between building(s) and the street unless the building(s) are set back from the curb a minimum of 125 feet and doors are screened by landscaping, berms, and/or fences.
- Buildings, structures, and loading facilities shall be designed and placed upon the site so that vehicles, whether rear or side loading, may be loaded or unloaded at any loading dock, door, or area without extending beyond the property line.

Driveway Standards

Driveways should be carefully located so as not to impede the primary function of the streets, which is to carry through traffic. It should be noted that these spacing guidelines are minimum values. The goal should be to exceed them where possible.

- Individual industrial parcels on major arterial streets may have driveways, but they should be carefully located so as not to impede the traffic efficiency. In general, parcels with frontage on the

major arterials should have their entryway on side streets if possible. If a parcel's only frontage is on the major arterial, every effort should be made to consolidate access at a single driveway. Spacing standards for driveways on major arterials shall be as follows:

a) Full access driveways, 500 ft. minimum
b) Partial access driveways (right in/out, left turn in), 500 ft. minimum
c) Right turn in and out, 350 ft. minimum upstream from an intersection
d) Right turn in and out, 200 ft. minimum downstream from an intersection

- On industrial streets, spacing for full access driveways is 450 feet, minimum. "T" intersections are encouraged over four-way intersections. Every effort should be made to consolidate driveways.
- No driveway shall be located closer than 200 feet to the radius return point at intersections.
- Driveways shall be a minimum of 25 feet wide. Subsequent development shall demonstrate driveway width and placement can accommodate truck turning movement and clearing without blocking roadways.
- Driveway width modifications may be approved with shared (ganged) driveways. Ganged driveways which serve two adjacent sites will be required to install landscaped islands along parking adjacent to the gang driveway and a landscape zone at the end of the common drive will act as a terminus to the view line down the ganged driveway.
- Full curb returns (as opposed to a standard driveway) shall be utilized for entries to all sites of over 10 acres in size or for common driveways that serve two adjacent sites that together total more than 10 acres.
- Access driveways shall provide adequate length to accommodate off-street vehicle stacking needs during times of peak use.
- Parcel entry should be clear, attractive, and inviting; circulation should direct employee and visitor traffic clearly through the site to main building entries and drop-off points and service trucks to loading.

Freeway Interface

The control of views of Tracy from I-205 is critical for the establishment of a quality image for the community.

- Locate services and storage areas to minimize visibility from I-205.
- All freeway setback zones shall be planted with a combination of trees, shrubs, and groundcover. Automatic irrigation is required of all planted area. Use large scale trees, from a 24-inch box minimum, grouped in single species clusters. Mass trees to avoid blocking views of commercial signage while providing at least one tree per 1,500 square feet of setback area. Plant shrubs in an informal hedge near the property line with gaps between hedges of 50 feet maximum. Install from 5-gallon cans, minimum, in single species clusters at least 100 feet long. Hydroseed or otherwise install permanent groundcover in all places not planted with shrubs.

Building Architecture

- Use of creative building design and construction techniques is encouraged. Special attention should be given to that portion of the building visible from adjacent roadways or public parking areas.

- Large buildings should have facades that include variations in massing, form, and texture. Continuous surface treatments of a single material should be minimized. Architecture should be used to highlight building entries.
- Any accessory buildings and enclosures, whether attached or detached from the main building, shall be of similar compatible design and materials.

Signs

- Signs must conform to the requirements of Signs, Title 10, Article 35 of the Tracy Municipal Code as modified herein.
- A site sign program should be integrated into a total design concept for a site and its buildings. The primary goal of the project sign system is to provide information and identification. When more than one sign is permitted, all signs shall be of similar style, shape, and materials.
- All signs must be approved prior to installation, and should be designed in a manner that coordinates the sign designs and locations with the site plan and building architecture for each project. The sign plans should include:

  a) **Detached Business Identification Signs:** One such monument sign (as defined by the Tracy Municipal Code) shall be allowed for each street frontage of the site. These signs may only contain the symbol and/or name of the business and its street address. The sign shall be free standing, may be double-sided, and shall be set back a minimum of 5 feet from the public right-of-way. Sign area shall not exceed 32 square feet per frontage and sign shall not exceed 6 feet in height from finished grade. Signs should generally be oriented perpendicular to approaching traffic.

  b) **Wall signs:** On large single tenant buildings, signs should be located immediately above or adjacent to the primary building entrance. No sign shall extend above dominant roof lines. The area of any single sign shall not exceed 100 square feet. Total area shall not exceed one-half square foot of sign per lineal foot of business being served.

  On smaller multi-tenant buildings, signs should be located at the frontage of each individual lessee. The area of any single sign shall not exceed 100 square feet nor more than 75 percent of the tenant frontage. Capital letters shall be no more than 2.5 feet in height and lower-case letters no more than 1.5 feet in height. When individually lettered wall signs comprise over 50 percent of the sign area of all sign types, total sign area shall not exceed 1.2 square feet per lineal foot of business being served. When comprising less than 50 percent of the total sign area, the maximum sign area shall be one-half square foot per lineal foot of business being served.

c) **Directional Signs:** Signs required or desired to assist patrons in accessing the facility shall be located in the site parking areas. The design of such signs shall be simple and easily legible. There is no limit to the number of signs provided on a site; however, no single sign shall exceed 6 square feet in area, except that vehicular "stop" signs shall be mounted per State standards.

- A sign may be illuminated provided that no flashing, traveling, animated, or intermittent illumination shall be used. Such illumination shall be confined to the area of the sign except when such illumination is back lighting for an otherwise non-illuminated sign. No sign illumination shall cast a glare which is visible from any street.
- Signs should be constructed with quality materials and in a craftsman-like manner to ensure both an attractive appearance and durability.

Landscaping

Minimum on-site landscaping requirements shall be established by Off-Street Parking Requirements (Title 10, Article 26 of the Tracy Municipal Code), except as modified below.

Summary of Requirements	*Industrial*
Landscaped frontage setback	15 feet
Minimum number of trees in parking area	1 tree per 10 spaces
Percentage of landscaping in parking areas with over	10 percent

- While commercial uses benefit from a well-landscaped parking area and visibility from the street, views of industrial uses benefit from a more generously landscaped streetscape. Thus, parking lot landscaping requirements for industrial uses may be reduced as specified in the Off-Street Parking Requirements in order to create a large landscape setback along the street. These provisions allow the reduction of 50 percent of the required landscaping based on the provision of a 15-foot landscape setback along the street frontage. The 15-foot strip may be included in the calculation of the total parking lot landscaping requirement. The remainder of the landscaping requirement must be distributed over the lot(s) to provide shade and landscape building frontage. Canopy trees shall be evenly distributed throughout the parking area to provide shade.
- On-site landscaping along rights-of-way between property lines and buildings, parking lots, or vehicular circulation improvements shall be installed by the property owner. This landscaping shall be designed as an extension of the adjacent public right-of-way landscaping. Completion of landscaping on the site shall be simultaneous with completion of the building and other improvements on the site.
- Landscaping shall not obstruct sight lines at street or driveway intersections.
- In place of the wheel stops at parking lots, landscape areas and pedestrian walkways may be extended not more than 2 feet into required parking spaces, to include a 6" concrete curb. In such cases, no credit toward parking lot landscape requirements shall be given for the resulting additional landscaping.

- Screening of the parking area from public rights-of-way in industrial areas shall be provided with a 2½ to 3-foot-high element, measuring from the top of the parking area pavement. Screening may consist of one or a combination of the following:

  a) Berms landscaped with ground cover, trees, and shrubs;
  b) Solid, low profile, decorative masonry walls;
  c) Evergreen shrubbery which, when solely used as screening, shall be continuously maintained to provide solid screening.

- Generous landscaping screening is required adjacent on all street frontages for industrial areas. These areas should be landscaped with a combination of trees, shrubs, and ground cover to soften views of parking areas.
- Tree planting and selection and massing should be compatible with streetscape plantings. Provide minimum one tree per 400 square feet of landscape setback. The plant palette should be relatively limited and applied in groupings of similar species rather than a few plants of many different species planted together.
- The use of water conserving plantings, such as California natives and drought tolerant trees, shrubs, and turf is encouraged. The use of turf in the narrow planting islands is discouraged.
- Live plant materials shall be used in all landscaped areas. The use of gravel, colored rock, bark, and other similar materials are not acceptable as a sole groundcover material.
- All trees shall be of 24-inch box size minimum at planting with a minimum branching height 5 years after installation of 10 feet above road or parking surfaces and 6 feet at pedestrian areas. Shrubs shall be of 5-gallon size minimum with a maximum on center spacing of 24 inches. Likewise, groundcover may be planted at 1 gallon size minimum with a maximum spacing of 12 inches on center.
- Automatic irrigation is required for all landscaped areas. Irrigation systems shall be designed so as not to overspray walks, buildings, and parking areas.

Screening and Storage

- All exterior trash areas, storage structures, and service areas shall be screened from public view with a wall or fence of a minimum height of 8 feet above the street curb level. Storage areas shall be set back a minimum of 50 feet from streets, unless fully enclosed in an architecturally compatible enclosure.
- No storage areas are allowed within the landscape easements, front setbacks, or side or rear yard landscaped buffers.
- Roof-mounted equipment shall be screened from street view. Pad-mounted transformers, utility connections, and meter boxes shall be screened and integrated into the site plan.
- The design of masonry walls, fencing, trash enclosures, and similar accessory site elements should be compatible with the architecture of the building and should use similar materials. Where masonry walls are along property frontage, they should enhance the entrance to the property and

should not impair traffic safety by obscuring views. Long expanses of wall surfaces should be architecturally designed to prevent monotony.

- The use of chain link fences shall be discouraged, and no chain link fences shall be visible from any public right-of-way.

Tracy Municipal Code

Chapter 7.08–Trees and Shrubbery

This chapter regulates removal, alteration, planting, and maintenance of public trees (mainly street trees) and shrubbery and requires a permit for removal or alteration of a street tree, including tree stumps. Street trees are defined as "any tree that has the center of its trunk at ground level located within the right-of-way or planting easement. Shrubs with multiple, or single, trunk(s) are included in this definition of 'street tree.' The [Parks and Community Services or Public Works] Director shall determine whether any specific woody plant shall be considered a 'street tree.'"[2] No replacement ratio for removed or altered trees is identified in the ordinance.

3.1.4 - Impacts and Mitigation Measures

Significance Criteria

The City, in its discretion, is using Appendix G of the State CEQA Guidelines as thresholds of significance for this project. According to CEQA Guidelines' Appendix G Environmental Checklist, to determine whether impacts related to aesthetics are significant environmental effects, the following questions are analyzed and evaluated. Would the proposed project:

a) Have a substantial adverse effect on a scenic vista?

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway?

c) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Approach to Analysis

This analysis provides a discussion of the visual impacts to aesthetic resources associated with the proposed project and its potential upon the project site and the vicinity. Several variables affect the degree of visibility, visual contrast, and ultimately the determination as to project impacts: (1) scale and size of facilities, (2) viewer types and activities, (3) distance and viewing angle, and (4) influences of adjacent scenery or land uses. Viewer response and sensitivity vary depending on viewer attitudes and expectations. Viewer sensitivity is distinguished among project viewers in identified scenic corridors and from publicly accessible recreational and plaza areas. Recreational areas and scenic corridors are

[2] City of Tracy. 2002. Tracy Municipal Code Section 7.07.010 – Definitions.

considered to have relatively high sensitivity. Drivers along I-205 and I-5 are considered to have relatively low sensitivity because of the speed of travel along these highways.

FCS evaluated potential project impacts on aesthetics, light, and glare through site reconnaissance and review of applicable plans and policies. FCS personnel visited the project site in April 2020, and documented site conditions through photographs, notes, aerial photographs, topographical and street maps, and project plans and elevations to identify surrounding land uses and to evaluate potential impacts from project development. The General Plan, the Municipal Code and NEI Specific Plan were reviewed to determine applicable policies, development standards, and design guidelines for the proposed project, and project plans were reviewed to determine compliance with the applicable requirements of the General Plan, Municipal Code and the NEI Specific Plan.

Light and Glare

The analysis of light and glare impacts in this section focuses on the nature and magnitude of changes in light and glare conditions of the project site and surrounding area. If light and glare conditions of the proposed project and the existing environment are similar, then the visual compatibility would be high and any resulting impacts would be less than significant. If light and glare conditions of the proposed project would strongly contrast with existing light and glare or applicable General Plan or NEI Specific Plan policies and guidelines and/or any applicable Municipal Code requirements, then light and glare compatibility would be low and significant impacts may result. Relevant urban design policies, requirements and guidelines are used to provide conclusions regarding significance of individual- and cumulative-level light and glare impacts.

Scenic Vistas

Impact AES-1: The proposed project would not have a substantial adverse effect on a scenic vista.

Construction

The General Plan identifies scenic resources rather than scenic vistas. Therefore, for the purposes of this analysis, a significant impact would occur if project construction would result in substantial adverse effects on the view of a scenic resource as defined by the General Plan. During construction, views of scenic resources could be impacted because of construction vehicles and dust generated from construction of the proposed project.

As described in the Environmental Setting, the General Plan and City of Tracy identify the following scenic resources: views of the Diablo Range, natural landscapes surrounding the Paradise Cut, Old River, and Tom Paine Sloughs, expansive agricultural areas, and hillside areas. In addition, entrances to the City from major roadways called “entry corridors” or “gateways” are important in providing a transition from a rural to urban environment and include views from the exits on I-205 off MacArthur Drive, Tracy Boulevard, Grant Line Road and Eleventh Street, and exits from I-580 at Lammers Road and Corral Hollow Road. The scenic resources visible from the project site and from adjacent, publicly accessible roadways (Grant Line Road, Paradise Road, and California Avenue) include views of the “entry corridors” from eastbound I-205 off MacArthur Drive, views of expansive agricultural lands, and views of the Diablo Range to the west.

Construction of the proposed project would not significantly interrupt views from the entry corridor off MacArthur Drive because of the distance to that corridor and intervening development and trees, all of which would remain. However, given the expected duration of construction (approximately 3 years) and the proximity of the project site to surrounding roadways (Grant Line Road, Paradise Road, and California Avenue), construction of the proposed project would obstruct, to a certain degree, views of expansive agricultural lands on and adjacent to the project site from these roadways. Though the project site is located far from the Diablo Range (approximately 9 miles to the east of the range), the Diablo Range is still visible from California Avenue. The initial construction of each phase of the proposed project would include demolition, site preparation, and grading, and, while construction vehicles would be on-site, those vehicles would not be tall enough to obstruct the views of expansive agricultural lands or views of the Diablo Range from California Avenue, and these views would only be partially obstructed while the structures of the buildings are being erected. Dust caused by construction would be kicked up intermittently throughout the day but would not obstruct these views for long period of time. In addition, as described in Section 3.3, Air Quality, the proposed project would be required to incorporate dust control measures as stipulated by District Rule 8021. Because the project site is located to the north and east of Grant Line Road and Paradise Road, respectively, views of the Diablo Range from those roadways would not be significantly affected by the proposed project's construction. In summary, construction of the proposed project would not result in a substantial impact to publicly accessible views from certain roadways of certain scenic resources (expansive agricultural lands and certain views of the Diablo Range) as defined in the General Plan. Impacts would be less than significant.

Operation

As noted above, the General Plan identifies scenic resources, rather than scenic vistas. Therefore, a significant impact would occur if project operation would result in substantial adverse effects on the view of a scenic resource, as defined by the General Plan (scenic resources are detailed in the Environmental Setting section and above).

As anticipated in the General Plan, the area surrounding the project site is a transition zone between rural and agricultural lands to an urban environment, and the General Plan seeks to enhance the City's identity by creating a soft transition between urban and non-urban uses around the edge of the City. Techniques used to achieve this goal are addressed in Goal CC-4, which recommends the use of buffer zones and landscaping to create appropriate transitions. The proposed project would be required to adhere to this goal and associated policies, including the use of a buffer zone and landscaping, which could be provided by the proposed stormwater detention basin.

The scenic resources visible from the project site and adjacent, publicly accessible roadways (Grant Line Road, Paradise Road, and California Avenue) are views of the "entry corridors," which include the eastbound exit from I-205 off MacArthur Drive, views of expansive agricultural lands, and views of the Diablo Range to the west. During operation, the buildings would not significantly interrupt views from the entry corridor off MacArthur Drive because of the distance to those corridors as well as intervening development and trees, all of which would remain and drivers along I-205 are considered to have a relatively low sensitivity because of the speed of travel along the highway.

The stormwater detention basin and land set aside for the future interchange area would provide a sizable setback between the homes on California Avenue and the proposed buildings on the Tracy Alliance parcels and the required landscaped frontage (per the NEI Specific Plan) would provide a setback (at least 10 feet) on the Zuriakat parcel. The proposed buildings would be similar in height to the existing industrial development located between the publicly accessible roadways and the Diablo Range. In addition, pursuant to the NEI Specific Plan, the maximum permitted height for the proposed buildings would be 60 feet, and the proposed buildings, as designed, would be required to comply with this requirement. Even with the setback and adherence to applicable development standards and design guidelines, given the change in the project site from expansive agriculture land to a large industrial site and the proximity of the project site to Grant Line Road, Paradise Road, and California Avenue, operation of the proposed project would impact views of expansive agricultural lands on and adjacent to the project site from publicly accessible roadways. However, this type of change was envisioned by the City in the General Plan and is in keeping with the General Plan goals, objectives policies described above as well as other surrounding urbanized uses in the general vicinity.

Because the project site is to the north and east of Grant Line Road and Paradise Road, respectively, views of the Diablo Range available to drivers traveling on these roadways would not be significantly affected. Drivers along these roadways would have a low sensitivity because of the typical speed of travel (40 miles per hour) along this roadway. Views of the Diablo Range from California Avenue are already partially obstructed by the intervening industrial developments, and the proposed buildings would result in further view obstruction. Though the proposed project would result in further obstruction of views of the Diablo Range from drivers along California Avenue, this roadway is considered to have a low sensitivity because of the typical speed of travel. In addition, this type of industrial development would be a continuation of the type of development that was envisioned by the General Plan and the already increasingly urbanized nature of the general vicinity. Therefore, the proposed project would not substantially impact publicly accessible views of scenic resources as defined by the General Plan during operation, and impacts would be significant less than significant.

Level of Significance

Less than significant impact.

Scenic Highways

Impact AES-2:	**The proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway.**

Construction

A significant impact would occur if proposed construction would substantially damage scenic resources as seen from a designated scenic highway. As shown in Exhibit 3.1-1, I-580 is officially designated as a State Scenic Highway between I-205 and I-5 and is the nearest State Scenic Highway from the project site.[3] The project site is located approximately 7.2 miles northeast of I-580 and is not visible from that highway. Intervening trees and development, all of which would remain, would obscure the project site from being viewed from this portion of the highway. Therefore, the proposed project would not further obstruct views

[3] California Department of Transportation (Caltrans). 2019. List of Eligible and Officially Designated State Scenic Highways. August.

from this highway. Thus, demolition, grading, and tree removal during construction would not result in substantial adverse impacts to scenic resources within a State Scenic Highway, and no significant impact would occur.

Operation

A significant impact would occur if project operation would substantially damage scenic resources as seen from a designated scenic highway. Given the absence of scenic highways proximate to the project site, and the presence of intervening trees and development between the project site and the nearest scenic highway, the proposed project would not significantly and adversely affect views from a State Scenic Highway during operation, and no significant impact would occur.

Level of Significance

Less than significant impact.

Visual Character

Impact AES-3: The proposed project is in an urbanized area. The proposed project would not conflict with applicable zoning and other regulations governing scenic quality.

The proposed project is located in an increasingly urbanized area and therefore, impacts to scenic quality are analyzed in terms of compatibility with applicable zoning and other regulations governing scenic quality. The City's General Plan designates the project site as Industrial (I). Primary land uses allowed under this designation consist of flex/office space, manufacturing, warehousing and distribution, and ancillary uses for workers' needs (e.g., restaurants, parks, consumers services, etc.). The maximum allowed FAR is 0.5.[4] The project site is not currently within City limits although it is within the City's current SOI; accordingly, the City of Tracy does not currently provide a zoning designation for the project site. The co-applicants are requesting pre-zoning to a designation of NEI Specific Plan and an amendment to the boundaries of the NEI Specific Plan to include the project site. No other proposed amendments to the NEI Specific Plan are being proposed by the co-applicants, and the proposed project would be required to be consistent with this proposed zoning.

Pursuant to the NEI Specific Plan, the maximum height for the proposed project is 60 feet (similar to other industrial buildings in the area) and the proposed buildings would not exceed this height. This height would also be consistent and thus compatible with adjacent existing industrial uses to the south and west. As described in the Environmental Setting and Regulatory Setting, the General Plan and NEI Specific Plan contain design guidelines and policies and development standards that include measures to help ensure quality design. These standards, policies and guidelines address placement and appearance of buildings, circulation, interfacing with I-205, parking and loading, landscape design, fencing and screening, signage, exterior lighting, and sustainable design practices. As anticipated in the General Plan, the area surrounding the project site is a transition zone between rural and agricultural lands to an urban environment. The General Plan seeks to enhance the City's identity by creating a soft transition between urban and non-urban uses around the edge of the City. Techniques used to achieve this goal are addressed in Goal CC-4, which recommends the use of buffer zones and landscaping to create

[4] Design, Community and Environment (prepared for the City of Tracy). 2011. City of Tracy General Plan. February 1.

appropriate transitions. The proposed project would be required to adhere to this goal and associated policies, including the use of a buffer zone and landscaping, which could be provided by the proposed stormwater detention basin. The proposed buildings would be setback (by at least 10 feet) from California Avenue, which would provide a transition between the homes and agricultural lands adjacent to the proposed project.

The proposed project would be required to comply with all applicable design guidelines and policies and development standards provided by the City to ensure consistency and visual compatibility with surrounding existing and planned uses. Therefore, impacts related to consistency with applicable scenic quality regulations and visual quality and character would be less than significant.

Level of Significance Before Mitigation

Less than significant impact.

Light and Glare

Impact AES-4:	**The proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.**

Construction

Construction-related impacts would include a certain amount of light and glare from construction equipment and machinery and nighttime security lighting. Light and glare during the construction phase would be temporary and limited to the duration of construction. Pursuant to Section 4.12.820 of the Municipal Code, construction activities would be limited to the 7:00 a.m. and 10:00 p.m. on weekdays or between the hours of 7:00 a.m. and 10:00 p.m. on weekends and federal holidays, which would limit the amount of nighttime construction lighting. Though there would be some nighttime lighting, it would not occur during the most sensitive time period (after 10:00 p.m.) when people are sleeping. Therefore, construction-related impacts associated with light and glare would be less than significant.

Operation

Light and Glare

The proposed project would have a significant impact if substantial light or glare would adversely affect nighttime or daytime views, respectively, in the area. Sources of daytime glare include direct beam sunlight and reflections from windows, architectural coatings, glass, and other reflective surfaces. Nighttime illumination and associated glare are generally divided into two sources: stationary and mobile. Stationary sources include structure lighting and decorative landscaping, lighted signs, solar panels, and streetlights. Mobile sources are primarily headlights from motor vehicles.

As described in the Environmental Setting, the project site contains minimal existing light or glare due to the small amount of existing development on-site. Exterior lighting would be located around and within the project site for security and safety reasons. As a result, the proposed project would increase the amount of light and glare on the project site. The light fixtures used for the proposed project would meet all applicable safety standards pursuant to the latest adopted edition of the California Building Code and would be installed throughout the length of the New Private Drive pursuant to the Municipal Code. The proposed project would be required to adhere to all applicable development standards and design guidelines provided in the NEI Specific Plan intended to reduce daytime glare and nighttime

lighting; the City would confirm consistency with these requirements as part of the development review process. The NEI Specific Plan provides that one lighting fixture style be used on all streets. Where possible, light standards would be in roadway medians.[5] Project signage would be required to conform to the applicable requirements of Municipal Code Chapter 10.08, Article 35, except as modified by the NEI Specific Plan. A site-specific sign program would be prepared and integrated into the total design concept for each individual development proposal within the proposed project, and all signs would be approved prior to installation. Sign illumination would be confined to the area of the sign except when such illumination is back lighting for an otherwise non-illuminated sign. No sign illumination would cast a glare which is visible from any street. Furthermore, project landscaping would be included along all project boundaries and throughout the site consistent with applicable requirements of the Municipal Code and the NEI Specific Plan. Landscaping would further reduce light spillage off-site and help to block glare from significantly impacting nearby uses to the extent feasible.

Given the nature of the proposed uses, it is anticipated that there would be minimal windows, but the windows could result in glare. This glare would be partially obscured by landscaping, depending on the time of day and the location of the reflecting light source. Glare may also occur from on-site vehicles; however, such glare would be transient, depending upon the time of day and location of the vehicle. Because of the proposed project's location adjacent to other existing urban development, the proposed project would not be adding significant nighttime lighting or glare in an area with no existing lighting impacts. Therefore, impacts to light and glare would be less than significant.

Level of Significance

Less than significant impact.

3.1.5 - Cumulative Impacts

Visual Character and Views

For purposes of evaluating the proposed project's cumulative impacts on visual character and views, the relevant geographic scope of review is within the immediate vicinity surrounding the project site. This is the area within view of the proposed project and therefore, the area most likely to experience changes in visual character or impacts to views. The cumulative setting includes relevant past, present and reasonably foreseeable future development, including existing agricultural and industrial uses located in the above-referenced geographic scope. A portion of the southwest corner of the project site is currently occupied by several residences and agricultural structures. Existing industrial development is located between the publicly accessible roadways and the Diablo Range. Additionally, three probable future cumulative projects listed in Table 3-1, Cumulative Project 15, Cumulative Project 19, and Cumulative Project 24, are within approximately 1 mile of the project site, the same visible area as the proposed project. Cumulative Project 15 is approximately 0.6 mile to the southwest, Cumulative Project 19 is adjacent to the southwest corner of the project site (just south of the intersection of Grant Line Road and East Paradise Road), and Cumulative Project 24 is 0.5 mile west of the project site. The cumulative projects are subject to applicable City Code provisions, development standards and design policies and guidelines related to building heights, setbacks, undergrounding of utilities, landscaping, signage, and permitted land uses as described above, which would serve to reduce visual impacts to a certain extent. Because the past, present and reasonably foreseeable cumulative projects would be consistent with the

[5] City of Tracy. 2012. Northeast Industrial Specific Plan. Page 24. July 17.

types of projects envisioned in the General Plan and reflect the increasingly urbanized nature of this area, and would adhere to all applicable regulations and policies, the cumulative impact of these cumulative projects is less than significant.

As described above, the proposed project would not result in significant impacts with respect to visual character and views. Therefore, the proposed project would not have a cumulatively considerable contribution to the already less than significant cumulative impact with respect to visual character and views.

Light and Glare

For purposes of evaluating the cumulative impacts on light and glare, the relevant geographic scope of review is within the immediate vicinity surrounding the project site. This is the area within view of the proposed project and therefore, the area most likely to experience changes in light and glare. The cumulative setting includes both existing agricultural land and outbuildings as well as industrial warehouses. Additionally, three reasonably foreseeable future cumulative projects listed in Table 3-1, Cumulative Project 15, Cumulative Project 19, and Cumulative Project 24, are within approximately 1 mile of the project site, the same visible area as the proposed project. Existing and new buildings associated with these existing and foreseeable cumulative projects could result in an increase in light and glare impacts on surrounding uses. Because these cumulative projects would be adjacent to other existing urban development, they would add significant nighttime lighting or glare in an area with no existing lighting impacts. The cumulative projects are required to adhere to all applicable development standards and design guidelines provided in the NEI Specific Plan intended to reduce daytime glare and nighttime lighting; the City would confirm consistency with these requirements as part of the development review process. Therefore, there is a less than significant cumulative impact to light and glare. As discussed above, the proposed project has a less than significant impact with respect to light and glare and its contribution to the already less than significant cumulative impact would not be considerable.

The proposed project combined with the relevant cumulative projects would include sources of daytime glare such as direct beam sunlight and reflections from windows, architectural coatings, glass, and other reflective surfaces. Nighttime illumination would include stationary sources such as structure lighting and decorative landscaping, lighted signs, solar panels, and streetlights. Mobile nighttime sources would primarily be from headlights from motor vehicles. As described above, the proposed project would not be adding significant lighting or glare in an area with no existing lighting impacts and would adhere to all applicable development standards provided in the NEI Specific Plan indented to reduce daytime glare and nighttime lighting and would not result in significant impacts with respect to light and glare to this already less than significant cumulative impact. As such, the proposed project, in conjunction with other cumulative projects, would not result in a cumulatively considerable contribution to the less than significant cumulative impact with respect to light and glare.

Level of Cumulative Significance

Less than significant impact.

THIS PAGE INTENTIONALLY LEFT BLANK

3.2 - Agriculture and Forestry Resources

3.2.1 - Introduction

This section describes existing agricultural resources and potential environmental effects thereon from project implementation on the project site and its surrounding area. Descriptions and analyses in this section are based, in part, on information contained in the City of Tracy General Plan, and California Department of Conservation Farmland Mapping and Monitoring Program (FMMP) maps. The following comments were received during the EIR scoping period related to Agriculture and Forestry Resources:

- The commenter requests that the EIR specify the type, amount, and location of farmland conversion resulting directly and indirectly from implementation of the project. The commenter asks that impacts on any current and future agricultural operations in the vicinity of the project site (e.g., land use conflicts, increases in land values and taxes, loss of agricultural support infrastructure such as processing facilities, etc.) be discussed in the EIR.
- The commenter requests that the EIR describe the incremental impacts leading to cumulative impacts on agricultural land. This would include impacts from the project, as well as impacts from other past, current, and likely future projects.
- The commenter asks that any proposed mitigation measures for all impacted agricultural lands within the proposed project area be described.
- The commenter asks that the EIR evaluate the project's compatibility with, or potential contract resolutions for land in an agricultural preserve and/or enrolled in a Williamson Act contract.

3.2.2 - Environmental Setting

Farmland Classifications

The California Department of Conservation FMMP classifies cultivated agricultural land into four categories, listed below:

- **Prime Farmland:** Land with the best combination of physical and chemical features able to sustain the long-term production of agricultural crops. These lands have the soil quality, growing season, and moisture supply needed to produce sustained high yields.
- **Unique Farmland:** Land of lesser-quality soils used for the production of the State's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards, as found in some climactic zones in California.
- **Farmland of Statewide Importance:** Land similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to hold and store moisture.
- **Farmland of Local Importance:** Land of importance in the local agricultural economy, as determined by each County's Board of Supervisors and a local advisory committee.

Williamson Act Contract

Williamson Act contracts are formed between a County or City and a landowner to restrict specific parcels of land to agricultural or related open space use in exchange for reduced property tax assessments. Private land within locally designated agricultural preserve areas are also eligible for enrollment under a contract. The minimum term for contracts is 10 years; however, since the contract term automatically renews annually, the actual term is essentially indefinite. Williamson Act contracts are described in more detailed in Section 3.2.4, Regulatory Framework.

3.2.3 - Existing Conditions

Agricultural Economy

According to the Economic Development Element of the City General Plan, between 1990 and 2000 Tracy's employment base nearly doubled as it shifted from a strong agricultural and transportation-driven economy to a services and retail economy. Agriculture remains a major activity within undeveloped portions of the Tracy Planning Area; based on available information included in the General Plan, a total of approximately 7,458 acres of agricultural uses were located within the Sphere of Influence (SOI): 1,618 within the city limits and 5,839 outside the city limits.[1]

Surrounding Agricultural Uses

Most areas north and east of the project site, in addition to a few parcels directly south and west, are currently used for agriculture. The County of San Joaquin zones areas north, east, and south of the project site (outside city limits) as AG-40, General Agriculture (40 acres) and designates these lands under the County General Plan as General Agriculture (A/G).[2]

Timber Land and Forest Land

Pursuant to California Public Resources Code Section 4526, timberland is defined as " . . . land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees…" Timberland zoned as Timberland Production, as defined by California Government Code Section 51104(g) is an area " . . . devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses . . . " As mapped by the United States Department of Agriculture Forest Service, there are no National Forest lands within the City Planning Area.[3]

City of Tracy

Farmland Classifications

Within the City, there are limited areas of Prime Farmland and Farmland of Local Importance. Land within the City limits contained approximately 1,415 acres of Prime Farmland, 198 acres of Unique

[1] Design, Community and Environment. 2011. City of Tracy General Plan (prepared for the City of Tracy). February 1.
[2] Mintier Harnish. 2016. San Joaquin County General Plan (prepared for San Joaquin County). December.
[3] United States Department of Agriculture (USDA). Forest Service, National Forest Type Groups. No date. Website: https://data.fs.usda.gov/geodata/rastergateway/forest_type/index.php. Accessed August 17, 2021.

Farmland, and 4,137 acres of Farmland of Local Importance.[4] Within the SOI, the City contained approximately 4,763 acres of Prime Farmland, 475 acres of Unique Farmland, and 4,958 acres of Farmland of Local Importance.

Soils

Capay clay and Stomar clay loam are the two most prominent soil types in the City and SOI.[5] Underlying soil types are relevant because certain types of soil are more suitable to agricultural uses than other soil types, and soil types assist the Natural Resources Conservation Service in its determination of farmland classifications.

Williamson Act Contract

In 2005, land within the city limits contained 1,360 lands under a Williamson Act Contract. Within its SOI, the City contained 4,073 acres of land under a Williamson Act Contract.[6]

Project Site

Farmland Classifications

Exhibit 3.2-1 depicts the Prime Farmland areas for the project site. The project site contains approximately 188 acres of Prime Farmland and approximately 4 acres of Semi-Agricultural and Rural Commercial Land, as classified by the FMMP.

Soils

Capay clay underlies the entire project site as shown in Exhibit 3.2-2.

Williamson Act Contract

The three Suvik Farms parcels are currently under Williamson Act contracts, totaling 46.61 acres (Exhibit 3.2-3). None of the other portions of the project site is currently under a Williamson Act contract.

Timberland and Forest Land

Most of the project site is occupied by row crops. A portion of the Tracy Alliance parcels are currently occupied by two existing approximately 1,000-square-foot residences (one occupied and one vacant), associated landscaping, and nine agricultural outbuildings used for equipment storage and maintenance, all located in the southwest corner of the property. The project site does not contain any forest land or timberland, as defined by Public Resource Code Section 4526, nor does it contain any timberland zoned Timberland Production, as defined by Government Code Section 51104(g).

3.2.4 - Regulatory Framework

State

California Department of Conservation Classification

The California Department of Conservation, Division of Land Resource Protection developed the FMMP in 1984 to analyze impacts to California's agricultural resources. In the FMMP, land ratings are based on a land capability classification system, and land use.

California Land Conservation Act (Williamson Act)

The California Land Conservation Act of 1965 (Williamson Act) enables local governments to enter contracts with private landowners to restrict specific parcels of land to maintain agricultural or related open space use. As an incentive, landowners receive lower property tax assessments based on agricultural or open space land uses, as opposed to real estate value of the land.

California Public Resources Code

California Public Resource Code Section 4562 defines Forest Land and Timber Land as follows:

Forest Land

Land that can support 10 -percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.

Timber Land

Land, other than land owned by the federal government and land designated by the Board of Forestry and Fire Protection (Board) as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the Board on a District basis after consultation with the District committees and others.

Local

San Joaquin County Multi-Species Habitat Conservation and Open Space Plan

The San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) was adopted in 2000 to provide a strategy for balancing the need to conserve open space and the need to convert open space to non-open space uses while protecting the region's agricultural economy; preserving landowner property rights; providing for the long-term management of plant, fish and wildlife species, especially those that are currently listed, or may be listed in the future, under the Federal Endangered Species Act (FESA) or the California Endangered Species Act (CESA); providing and maintaining multiple-use open spaces that contribute to the quality of life of the residents of San Joaquin County; and accommodating a growing population while minimizing costs to project applicants and society at large. The SJMSCP is administered by the San Joaquin Council of Governments.

The project site is located within the Central Zone; Category C, Agriculture Habitat Open Spaces; Pay Zone B (Agricultural) of the SJMSCP. Adoption and implementation of the SJMSCP is intended to

provide full compensation and mitigation for potential environmental impacts to covered plants, fish and wildlife and demonstrate compliance pursuant to State and federal laws such as the California Environmental Quality Act (CEQA), the National Environmental Policy Act (NEPA), State Planning and Zoning Law, the State Subdivision Map Act, the Porter-Cologne Act, and the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2001 (LAFCO Law) with respect to species covered under the SJMSCP.

Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (LAFCo Law)

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 requires that LAFCo review and update the SOI for each district within the county. In determining the SOI for an agency, LAFCo must consider and prepare written determinations with respect to five factors [Government Code §56425(e)].[7] These factors relate to the present and planned land uses including agricultural and open-space lands, the present and probable need for public facilities and services, the present capacity of public facilities and adequacy of public services, the existence of any social or economic communities of interest in the area, and the present and probable need for public facilities and services of any disadvantaged unincorporated communities within the existing sphere.

Section 56377 says "in reviewing and approving or disapproving proposals which could reasonably be expected to induce, facilitate, or lead to the conversion of existing open-space lands to uses other than open-space uses, the commission shall consider all of the following policies and priorities:

a) Development or use of land for other than open-space uses shall be guided away from existing prime agricultural lands in open-space use toward areas containing nonprime agricultural lands, unless that action would not promote the planned, orderly, efficient development of an area.

b) Development of existing vacant or nonprime agricultural lands for urban uses within the existing jurisdiction of a local agency or within the sphere of influence of a local agency should be encouraged before any proposal is approved which would allow for or lead to the development of existing open-space lands for non-open-space uses which are outside of the existing jurisdiction of the local agency or outside of the existing sphere of influence of the local agency."

Under LAFCo law, "prime agricultural land" means an area of land, whether a single parcel or contiguous parcels, that has not been developed for a use other than an agricultural use and that meets any of the following qualifications:

a) Land that qualifies, if irrigated, for rating as class I or class II in the United States Department of Agriculture (USDA) Natural Resources Conservation Service land use capability classification, whether or not land is actually irrigated, provided that irrigation is feasible.

[7] Assembly Local Government Committee. 2021. Guide to the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000. December. Website: https://calafco.org/sites/default/files/documents/CKH%20Guide%20Update%202021.pdf. Accessed March 29, 2022.

b) Land that qualifies for rating 80 through 100 Storie Index Rating.[8]

c) Land that supports livestock used for the production of food and fiber and that has an annual carrying capacity equivalent to at least one animal unit per acre as defined by the United States Department of Agriculture in the National Range and Pasture Handbook, Revision 1, December 2003.

d) Land planted with fruit or nut-bearing trees, vines, bushes, or crops that have a nonbearing period of less than five years and that will return during the commercial bearing period on an annual basis from the production of unprocessed agricultural plant production not less than four hundred dollars ($400) per acre.

e) Land that has returned from the production of unprocessed agricultural plant products an annual gross value of not less than four hundred dollars ($400) per acre for three of the previous five calendar years.

City of Tracy

Feathering

The City's General Plan contains policies and actions intended to preserve and enhance open spaces, including agricultural land. One policy and action identify locations for soft and hard edges for the City. Soft edges are defined as a feathering of density between urban and rural uses. Whereas hard edges are an abrupt separation from urban and rural uses, such as a fence or highway. The City's General Plan establishes the following objectives and policies related to agricultural resources that are relevant to this analysis:

Policy

OSC-2.1 Policy 2 The City shall support San Joaquin County policies and zoning actions that maintain agricultural lands in viable farming units for those areas not currently designated for urban uses.

Objective OSC-2.2 Minimize conflicts between agricultural and urban uses.

Policies

OSC-2.2 Policy 1 Development projects shall have buffer zones, such as roads, setbacks and other physical boundaries, between agricultural uses and urban development. These buffer zones shall be of sufficient size to protect the agriculture operations from the impacts of incompatible development and shall be established based on the proposed land use, site conditions and anticipated agricultural practices. Buffers shall be located on the land where the use is being changed, and shall not become the maintenance responsibility of the City.

[8] The Storie index is a method of soil rating based on soil characteristics that govern the land's potential utilization and productivity capacity.

OSC-2.2 Policy 2 Land uses allowed near agricultural operations should be limited to those not negatively impacted by dust, noise, and odors.

City of Tracy Right to Farm Ordinance

Chapter 10.24 of the Tracy Municipal Code is a "Right to Farm" Ordinance intended to protect agricultural productivity in the City. The ordinance states:

a) No agricultural operation, or appurtenances thereof, conducted or maintained for commercial purposes, and in a manner consistent with the proper and accepted customs and standards as established and followed by similar agricultural operations in the same locality, shall be or become a nuisance, private or public, due to any changed condition in or about the locality. The above shall be the case provided that the agricultural operation has been in operation for more than three (3) years.

b) Subsection (a) of this section shall not apply whenever a nuisance results from the negligent or improper handling of any such agricultural operation by person(s) or entities responsible for such operations, and if the agricultural operation obstructs free passage or use in the customary manner of any navigable lake, river, bay, stream, canal, basin, or any public park, square, street or highway. Nothing in this chapter shall prevent anyone from complaining to any appropriate agency, or taking any other available remedy, concerning any unlawful or improper agricultural practice.

City of Tracy Agriculture Mitigation Fee Program

On June 7, 2005, the City Council adopted Chapter 13.28 (Agricultural Mitigation Fee) to its Municipal Code. In addition, the City Council adopted a resolution approving the Central Valley Farmland Trust Inc., as a qualifying agency to receive funds.[9] These actions were in response to the conclusions set forth in the General Plan EIR, which analyzed the potential impacts from long-term development in the City as reflected in the land use vision of the General Plan and identified the Agricultural Mitigation Fee Ordinance as a supportive policy that the City can use to reduce the impacts associated with conversion of Important Farmland. However, no feasible mitigation measures were identified to reduce this impact to below a level of significance, and the City Council adopted a Statement of Overriding Considerations with respect to the anticipated loss of Important Farmland that would result because of the City's adoption of the General Plan and implementation of the land use vision reflected therein.

The purpose of the fee is to mitigate the loss of productive agricultural lands converted for urban uses within the City by permanently protecting other agricultural lands planned for agricultural use and by working with farmers who voluntarily wish to sell or restrict their land in exchange for fair compensation. The relationship between the fee and the purpose is detailed in the Tracy Municipal Code Chapter 13.28 and in the South San Joaquin County Farmland Conversion Fee Nexus Study, dated July 18, 2005. This program requires the owner of farmland that is to be developed for private urban uses (such as residential, commercial, industrial, or other urban uses) to pay an Agricultural Mitigation Fee for each acre of farmland developed. The City collects fees at the time building

[9] Tracy City Council. 2008. Resolution No. 2008-204. October 7.

permits are issued, and fees are used to purchase agricultural conservation easements on agricultural lands.

3.2.5 - Impacts and Mitigation Measures

Significance Criteria

The City, in its discretion, is utilizing CEQA Guidelines Appendix G, to determine whether impacts to agriculture and forestry resources are significant environmental effects, the following questions are analyzed and evaluated. Would the project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code [PRC] § 12220(g)), timberland (as defined by PRC § 4526), or timberland zoned Timberland Production (as defined by Government Code § 51104(g))?

d) Result in the loss of forest land or conversion of forest land to non-forest use?

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Approach to Analysis

FirstCarbon Solutions (FCS) evaluated potential impacts on agricultural resources through review of FMMP and Williamson Act maps, site plans, and applicable plans and policies.

Impacts Evaluation

Conversion of Important Farmland to Non-Agricultural Use

Impact AG-1:	**The project would convert Farmland pursuant to the FMMP, to non-agricultural use.**

The project site contains approximately 188 acres of Prime Farmland, pursuant to the current FMMP mapping (Exhibit 3.2-1) available at the time environmental review commenced for the proposed project.[10] The proposed project is consistent with the land use designation and densities established by the General Plan and conversion of the project site to industrial use was envisioned as part of buildout under the General Plan and evaluated and disclosed under the General Plan EIR. Nevertheless, for purposes of a conservative analysis, this Draft EIR acknowledges that the proposed project would result in the loss of Prime Farmland as a result of its conversion of Prime Farmland to urban uses. On June 7, 2005, the City Council adopted Chapter 13.28 Agricultural Mitigation Fee to its Municipal Code. In addition, the City Council adopted a resolution approving the Central Valley

[10] California Department of Conservation, Division of Land Resource Protection. 2018. Farmland Mapping and Monitoring Program.

Farmland Trust as a qualifying agency to receive funds.[11] This program serves as mitigation to the extent feasible for the conversion of Prime Farmland. In accordance with Chapter 13.28 of the Municipal Code, Agricultural Mitigation Fee, the developers of the Suvik Farms, Zuriakat, and Tracy Alliance parcels would each be required to pay applicable Agricultural Mitigation fees in connection with individual development proposals as implemented by MM AG-1. In addition, the SJMSCP works at a regional level to promote the permanent preservation of agricultural lands in San Joaquin County. The SJMSCP calls for the preservation of about 100,000 acres, including 57,000 agricultural acres, over a 50-year period for the protection of a variety of biological species. Most agricultural conservation easements in the County are the product of the SJMSCP. The proposed project would be required to comply with applicable provisions of the SJMSCP (see Section 3.4, Biological Resources, for more information), which may include payment of development fees for conversion of lands. Even with the payment of City mitigation fees and adherence to the SJMSCP, the proposed project would result in significant and unavoidable impacts related to the conversion of Farmland as identified by FMMP mapping to non-agricultural use since the foregoing would not fully avoid the impacts of this conversion**.**

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

MM AG-1 Payment of Agricultural Mitigation Fees

At the time of issuance of building permits for each individual development proposal, the relevant applicant(s) for the subject development proposal shall pay the applicable Agriculture Mitigation Fee in accordance with Chapter 13.28 of the Municipal Code.

Level of Significance After Mitigation

Significant and unavoidable.

Conflict with Existing Zoning or Williamson Act Contract

Impact AG-2: The project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.

Agricultural Zoning

The existing zoning for the project site is AG-40 under the County's General Plan. However, the co-applicants are requesting pre-zoning to "Northeast Industrial (NEI) Specific Plan," which would take effect upon annexation into the City. This zoning district would be consistent with the existing Industrial General Plan designation under the City's General Plan, and project development would be governed by the NEI Specific Plan (as amended), which allows Light Industrial uses.[12] Because the pre-zoning allows for industrial use, the change in zoning from AG-40 under the County's General

[11] Tracy City Council. 2008. Resolution No. 2008-204. October 7.
[12] City of Tracy. 2016. Tracy Municipal Code Section 10.08.3022–Northeast Industrial Specific Plan. October 18.

Plan to NEI Specific Plan zoning would ensure there is no conflict with existing zoning. Impacts would be less than significant.

Williamson Act Contracts

The Suvik Farms parcels are covered by an active Williamson Act contract; none of the other lands within the project site is covered by an active Williamson Act contract. Pursuant to the applicable provisions of the California Government Code, the Suvik Farms landowners initiated a Notice of Nonrenewal in 2017 for the contract, beginning a nine-year process to formally expire the contract. Based on the date of the Notice of Nonrenewal, the contract will expire on August 21, 2026. Additionally, State law provides a detailed procedure to terminate a Williamson Act contract. Accordingly, should development of the Suvik Farms parcels be pursued prior to the Williamson Act contract expiration date, then pursuant to the provision of the Williamson Act, the applicant for the development of the Suvik Farms parcels would be required to petition the City Council for cancellation, or agree to the imposition of a condition of approval such that no permit for development on the Suvik Farms parcels would be issued prior to the August 21, 2026 expiration date. Accordingly, because the Suvik Farms parcels applicant would be required to follow applicable provisions of State law, the proposed project would not result in any conflicts with a Williamson Act Contract and impacts would be less than significant.

Level of Significance

Less than significant impact.

Conflict with Existing Forest Land Zoning

Impact AG-3:	**The project would not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production.**

The project site does not contain any forest land or timberland, as defined by Public Resource Code Section 4526, nor does it contain any timberland zoned Timberland Production, as defined by Government Code Section 51104(g). This condition precludes the possibility of the proposed project conflicting with forest zoning of forest land or timberland. No impact would occur.

Level of Significance

No impact.

Conversion of Forest Land to Non-Forest Use

Impact AG-4:	**The project would not result in the loss of forest land or conversion of forest land to non-forest use.**

As explained more fully above, the project site is adjacent to urbanized, industrial land uses (with these surrounding uses also not containing any forest land), and does not contain any forest land. This condition precludes the possibility of the proposed project converting forest land to non-forest use. Therefore, no impacts would occur.

Level of Significance

No impact.

Other Changes to Convert Farmland to Non-Agricultural Use or Forest Land to Non-Forest Use

Impact AG-5:	**The project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.**

Impact Analysis

As discussed above, the County of San Joaquin zones areas north, east, and south of the project site (outside City limits) as AG-40, General Agriculture (40 acres), and designates these lands under the County General Plan as General Agriculture (A/G).[13] Similar to the proposed project, the land directly northwest of the project site (north of I-205) is within the City's SOI and is designated Industrial by the General Plan. For this land to be converted to non-agricultural uses, it would need to be annexed into the City of Tracy and would require the completion of CEQA analysis prior to the discretionary approval of any development. However, the proposed project does not include the annexation of these lands and, therefore, would not result in a change in the existing environment that could result in conversion of Farmland to non-agricultural use. Though there is a possibility this land would be converted to non-agricultural uses in the future, the proposed project would not be the cause of that conversion. Moreover, the proposed project would be required to adhere to applicable Right-to-Farm provisions described above, which would help to avoid any potential land use incompatibility issues that could otherwise facilitate the eventual conversion of other agricultural lands.

As explained more fully above, the project site is adjacent to urbanized, industrial land uses; these adjacent lands does not contain any forest land. This condition precludes the possibility of the proposed project converting forest land to non-forest use.

Impacts under this criterion would be less than significant.

Level of Significance

Less than significant impact.

3.2.6 - Cumulative Impacts

Agriculture

The geographic scope of this cumulative analysis includes past, present and reasonably foreseeable future projects on lands within the NEI Specific Plan area. The relevant Cumulative Projects 11, 12, 13, 14, 15, 19, are all planned for industrial uses; the relevant Cumulative Projects 27 and 35 are transportation projects. Much of the NEI Specific Plan area consists of Prime Farmland that would be converted to non-agricultural uses with implementation of the relevant cumulative projects, as already envisioned by the Industrial general plan and specific plan designations. Like the proposed project, any of the cumulative projects that would convert Farmland to non-agricultural uses would pay the applicable Agricultural Mitigation Fee. In addition, the SJMSCP works at a regional level to promote the permanent preservation of agricultural lands in San Joaquin County. The SJMSCP calls for the preservation of about 100,000 acres, including 57,000 agricultural acres, over a 50-year period for the protection of a variety of biological species. Most agricultural conservation easements

[13] Mintier Harnish. 2016. San Joaquin County General Plan (prepared for San Joaquin County). December.

in the County are the product of the SJMSCP. All of the cumulative projects are within San Joaquin County and would be required to adhere to the SJMSCP, which may include payment of development fees for conversion of lands. Even with payment of this fee and adherence to the SJMSCP, the development of the cumulative projects would result in a significant and unavoidable impact, which the General Plan EIR previously disclosed and the City Council previously adopted a Statement of Overriding Considerations in connection with the Council's adoption of the General Plan. As discussed above, the proposed development of the project would result in the loss of approximately 188 acres of Prime Farmland, which would result in a project-level significant and unavoidable impact. Therefore, given the existence of a cumulative impact with respect to agricultural resources, the proposed project's contribution to this significant cumulative effect to agricultural resources would be considered cumulatively considerable.

Forestry Resources

Similar to the relevant geographic scope for agricultural resources described above, the geographic scope of this cumulative analysis with respect to forestry resources is lands within the NEI Specific Plan area. As mapped by the United States Department of Agriculture Forest Service, there are no National Forest lands within the City or the City's SOI, which includes the NEI Specific Plan area.[14] The project site and the cumulative project sites do not contain forest land or timberland, as defined by Public Resource Code Section 4526, nor do they contain any timberland zoned Timberland Production, as defined by Government Code Section 51104(g). Therefore, the cumulative projects would not conflict with forest zoning or converting forest land to non-forest use, and thus there would be no significant cumulative impact in this regard. Furthermore, this condition precludes the possibility of the proposed project, in conjunction with the cumulative projects, to conflict with forest zoning or converting forest land to non-forest use. Therefore, the proposed project would not have a cumulatively considerable contribution to the already less than significant cumulative impact with respect to forestry resources.

Level of Cumulative Significance

Significant and unavoidable (with respect to Agricultural Resources).

Less than significant impact (with respect to Forestry Resources).

3.3 - Air Quality

3.3.1 - Introduction

This section describes existing air quality conditions regionally and locally as well as the relevant regulatory framework. This section also evaluates the potential impacts related to air quality that could result from implementation of the proposed project. Information included in this section is based, in part, on project-specific air quality modeling results included in Appendix B.

3.3.2 - Environmental Setting

The proposed project is located in unincorporated San Joaquin County adjacent to the City of Tracy's municipal boundaries, within the San Joaquin Valley Air Basin (Air Basin). Regional and local air quality is impacted by topography, dominant airflows, atmospheric inversions, location, and season. The following section describes these conditions as they pertain to the Air Basin.

San Joaquin Valley Air Basin

The information in this section is primarily from the San Joaquin Valley Air Pollution Control District (Valley Air District) Guide for Assessing and Mitigating Air Quality Impacts (GAMAQI) and the accompanying Technical Document.[1,2]

Topography

The topography of a region is important for air quality because mountains can block airflow that would help disperse pollutants and can channel air from upwind areas that transports pollutants to downwind areas. The Valley Air District covers the entirety of the Air Basin. The Air Basin is generally shaped like a bowl. It is open in the north and is surrounded by mountain ranges on all other sides. The Sierra Nevada lies along the eastern boundary (8,000 to 14,000 feet in elevation), the Coast Ranges are along the western boundary (3,000 feet in elevation), and the Tehachapi Mountains are along the southern boundary (6,000 to 8,000 feet in elevation).

Climate

The climate is important for air quality because of differences in the atmosphere's ability to trap pollutants close to the ground, creating adverse air quality or rapidly dispersing pollutants over a wide area, thus preventing high concentrations from accumulating under different climatic conditions. The Air Basin has an "inland Mediterranean" climate and is characterized by long, hot, dry summers and short, foggy winters. Sunlight can be a catalyst in the formation of some air pollutants (such as ozone); the Air Basin averages over 260 sunny days per year.

Dominant airflows provide the driving mechanism for transport and dispersion of air pollution. The mountains surrounding the Air Basin form natural horizontal barriers to the dispersion of air contaminants. The wind generally flows south-southeast through the Valley, through the Tehachapi

[1] San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. Guidance for Assessing and Mitigating Air Quality Impact. Website: http://www.valleyair.org/transportation/GAMAQI_12-26-19.pdf Accessed January 28, 2021.

[2] San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. 2015 Plan for the 1997 PM 2.5 Standard. Website: http://www.valleyair.org/Air_Quality_Plans/docs/PM25-2015/2015-PM2.5-Plan_Bookmarked.pdf Accessed January 28, 2021.

Pass and into the Southeast Desert Air Basin portion of Kern County. As the wind moves through the Air Basin, it mixes with the air pollution generated locally, generally transporting air pollutants from the north to the south in the summer and in a reverse flow in the winter.

Existing Air Quality Conditions

The local air quality can be evaluated by reviewing relevant air pollution concentrations near the project site and vicinity. Table 3.3-1 summarizes 2017 through 2019 published monitoring data, which is the most recent 3-year period available as of the date of commencement of environmental review for the proposed project. The table displays data from the Tracy-Airport monitoring station (located approximately 5.2 miles southwest of the project site) for ozone, nitrogen dioxide, and particulate matter, including dust, 10 micrometers or less in diameter (PM_{10}) concentrations. As particulate matter, including dust, 2.5 micrometers or less in diameter ($PM_{2.5}$) concentrations were not available at the Tracy-Airport monitoring station. Therefore, the next closest station with $PM_{2.5}$ was used to provide $PM_{2.5}$ concentrations representative of the project site and vicinity. Table 3.3-1 provides $PM_{2.5}$ concentrations from the Manteca-530 Fishback Road monitoring station, located approximately 7.5 miles northeast of the project site. No carbon monoxide (CO) or sulfur dioxide (SO_2) concentrations were available at any nearby monitoring station. The data shows that during the above-referenced 3 years, the project site and vicinity have exceeded the national ozone and $PM_{2.5}$ standards and the State ozone and PM_{10} standards. The data in the table reflects the concentration of the pollutants in the air, measured using air monitoring equipment. This differs from emissions, which are calculations of a pollutant being emitted over a certain period.

Table 3.3-1: Air Quality Monitoring Summary

Air Pollutant	Averaging Time	Item	2017	2018	2019
Ozone[1]	1 Hour	Max 1 Hour (ppm)	**0.093**	**0.099**	**0.095**
		Days > State Standard (0.09 ppm)	0	**1**	**1**
	8 Hours	Max 8 Hours (ppm)	**0.082**	**0.081**	**0.079**
		Days > State Standard (0.07 ppm)	**7**	**8**	**3**
		Days > National Standard (0.075 ppm)	**5**	**8**	**3**
Carbon monoxide[3]	8 Hours	Max 8 Hours (ppm)	ND	ND	ND
		Days > State Standard (9.0 ppm)	ND	ND	ND
		Days > National Standard (9 ppm)	ND	ND	ND
Nitrogen dioxide[1]	Annual	Annual Average (ppm)	0.004	0.005	0.004
	1 Hour	Max 1 Hour (ppm)	0.041	0.049	0.037
		Days > State Standard (0.18 ppm)	0	0	0
Sulfur dioxide[3]	Annual	Annual Average (ppm)	ND	ND	ND
	24 Hours	Max 24 Hours (ppm)	ND	ND	ND
		Days > State Standard (0.04 ppm)	ND	ND	ND

Air Pollutant	Averaging Time	Item	2017	2018	2019
Inhalable coarse particles (PM_{10})[1]	Annual	Annual Average (µg/m^3)	22.6	24.7	19.4
	24 hours	24 Hours (µg/m^3)	**152.0**	**250.2**	**241.4**
		Days > State Standard (50 µg/m^3)	ID	ID	ID
		Days > National Standard (150 µg/m^3)	0	**2**	**1**
Fine particulate matter ($PM_{2.5}$) [2]	Annual	Annual Average (µg/m^3)	11.1	13.4	ID
	24 Hours	24 Hours (µg/m^3)	**50.0**	**180.0**	**42.4**
		Days > National Standard (35 µg/m^3)	**9**	**15**	**2**

Notes:
> = exceed
µg/m^3 = micrograms per cubic meter
max = maximum
ND = no data
ppm = parts per million
Bold = exceedance
State Standard = California Ambient Air Quality Standard
National Standard = National Ambient Air Quality Standard
[1] Ozone, PM_{10}, and NO_2 concentrations and exceedances were drawn from the Tracy-Airport monitoring station.
[2] $PM_{2.5}$ concentrations and exceedances were drawn from the Tracy-Airport monitoring station.
[3] No concentrations of SO_2 and CO were unavailable for monitoring sites in the project area.

The health impacts of the various air pollutants of concern can be presented in a number of ways. The clearest in comparison is to the State and federal ozone standards. If concentrations are below the applicable ozone standard, industry standards generally indicate that there would not be a health impact. When concentrations exceed the applicable ozone standard, impacts will vary based on the amount the standard is exceeded. The United States Environmental Protection Agency (EPA) developed the Air Quality Index (AQI) as an easy-to-understand measure of health impacts compared with concentrations in the air. Table 3.3-2 provides a description of the health impacts ozone at different concentrations.

Table 3.3-2: Air Quality Index and Health Effects

Air Quality Index/ 8-hour Ozone Concentration	Health Effects Description
AQI—0–50 (Good)/ Concentration 54 parts per billion (ppb)	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: None.
	Cautionary Statements: None.
AQI—51–100 (Moderate)/ Concentration 70 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Unusually sensitive individuals may experience respiratory symptoms.

Air Quality Index/ 8-hour Ozone Concentration	Health Effects Description
	Cautionary Statements: Unusually sensitive people should consider limiting prolonged outdoor exertion.
AQI—101–150 (Unhealthy for Sensitive Groups)/Concentration 85 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Increasing likelihood of respiratory symptoms and breathing discomfort in active children and adults and people with respiratory disease, such as asthma.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should limit prolonged outdoor exertion.
AQI—151–200—(Unhealthy)/Concentration 105 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Greater likelihood of respiratory symptoms and breathing difficulty in active children and adults and people with respiratory disease, such as asthma; possible respiratory effects in general population.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit prolonged outdoor exertion.
AQI—201-300—(Very Unhealthy)/Concentration 200 ppb	**Sensitive Groups**: Children and people with asthma are the groups most at risk.
	Health Effects Statements: Increasingly severe symptoms and impaired breathing likely in active children and adults and people with respiratory disease, such as asthma; increasing likelihood of respiratory effects in general population.
	Cautionary Statements: Active children and adults, and people with respiratory disease, such as asthma, should avoid all outdoor exertion; everyone else, especially children, should limit outdoor exertion.
Source: AirNow.gov. U.S. Air Quality Index Calculator. Website: https://www.airnow.gov/aqi/aqi-calculator/. Accessed February 16, 2021.	

Based on the AQI scale for the 8-hour ozone standard, Tracy experienced 18 days in the above-referenced 3 years that would be categorized as unhealthful for sensitive groups (AQI 150), as measured at the Tracy-Airport monitoring station.

Attainment Status

The EPA and the California Air Resources Board (ARB) designate air basins where ambient air quality standards are exceeded as “nonattainment” areas. If standards are met, the area is designated as an “attainment” area. If there is inadequate or inconclusive data to make a definitive attainment designation, they are considered “unclassified.” National nonattainment areas are further

designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards.

Each standard has a different definition, or "form" of what constitutes attainment, based on specific air quality statistics. For example, the federal 8-hour CO standard is not to be exceeded more than once per year; therefore, an area is in attainment of the CO standard if no more than one 8-hour ambient air monitoring measurement exceeds the threshold per year. In contrast, the federal annual $PM_{2.5}$ standard is met if the 3-year average of the annual average $PM_{2.5}$ concentration is less than or equal to the standard.

The current attainment designations for the San Joaquin Valley Air Basin are shown in Table 3.3-3. The Air Basin is designated as nonattainment for ozone, PM_{10}, and $PM_{2.5}$.

Table 3.3-3: San Joaquin Valley Air Basin Attainment Status

Pollutant	State Status	National Status
Ozone–1 Hour	Nonattainment/Severe	No Standard
Ozone–8 Hours	Nonattainment	Nonattainment/Extreme
Carbon monoxide	Attainment/Unclassified	Merced, Madera, and Kings Counties are unclassified; others are in Attainment
Nitrogen dioxide	Attainment	Attainment/Unclassified
Sulfur dioxide	Attainment	Attainment/Unclassified
PM_{10}	Nonattainment	Attainment
$PM_{2.5}$	Nonattainment	Nonattainment
Lead	Attainment	No Designation/Classification
Source: California Air Resources Board (ARB). 2021. Maps of State and Federal Area Designations. Website: https://ww2.arb.ca.gov/resources/documents/maps-state-and-federal-area-designations. Accessed February 16, 2021.		

3.3.3 - Regulatory Framework

Air pollutants are regulated primarily to protect human health and for secondary effects such as visibility and property damage from pollutant deposition. The Clean Air Act (CAA) of 1970 tasks the EPA with setting air quality standards. The State of California also sets air quality standards that are in some cases more stringent than federal standards and address additional pollutants. The following section describes these federal and State standards and the health effects of the regulated pollutants.

Clean Air Act

Congress established much of the basic structure of the CAA in 1970 and made major revisions in 1977 and 1990. Six common air pollutants (also known as criteria pollutants) are addressed in the CAA. These are particulate matter, ground-level ozone, carbon monoxide, sulfur oxides, nitrogen oxides, and lead. The EPA calls these pollutants criteria air pollutants because it regulates them by developing human health-based and/or environmentally based criteria (science-based guidelines)

for setting permissible levels. The set of limits based on human health are called primary standards. Another set of limits intended to prevent environmental and property damage are called secondary standards.[3] The federal standards are called National Ambient Air Quality Standards (NAAQS). The air quality standards provide benchmarks for determining whether air quality is healthy at specific locations and whether development activities will cause or contribute to a violation of the standards. The criteria pollutants are:

- Ozone
- Nitrogen dioxide (NO_2)
- Lead
- Particulate matter (PM_{10} and $PM_{2.5}$)
- Carbon monoxide (CO)
- Sulfur dioxide

The federal standards were set to protect public health, including that of sensitive individuals; thus, the EPA is tasked with updating the standards as more medical research is available regarding the health effects of the criteria pollutants. Primary federal standards are the levels of air quality necessary, with an adequate margin of safety, to protect the public health.

California Clean Air Act

The California Legislature enacted the California Clean Air Act (CCAA) in 1988 to address air quality issues of concern not adequately addressed by the federal CAA at the time. California's air quality problems were and continue to be some of the most severe in the nation and required additional actions beyond the federal mandates. The ARB administers California Ambient Air Quality Standards (CAAQS) for the 10 air pollutants designated in the CCAA. The 10 State air pollutants are the six federal standards listed above as well as visibility reducing particulates, hydrogen sulfide, sulfates, and vinyl chloride. The EPA authorized California to adopt its own regulations for motor vehicles and other sources that are more stringent than similar federal regulations implementing the CAA. Generally, the planning requirements of the federal CAA are less stringent than the CCAA; therefore, consistency with the CCAA will also demonstrate consistency with the federal CAA.

Air Pollutant Description and Health Effects

The federal and State ambient air quality standards, the most relevant effects, the properties, and sources of the pollutants are summarized in Table 3.3-4.

[3] United States Environmental Protection Agency (EPA). 2021. NAAQS Table. Website: https://www.epa.gov/criteria-air-pollutants/naaqs-table. Accessed February 16, 2021.

Table 3.3-4: Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Ozone	1 Hour	0.09 ppm	—	Irritate respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; increased mortality risk; vegetation and property damage.	Ozone is a photochemical pollutant as it is not emitted directly into the atmosphere but is formed by a complex series of chemical reactions between reactive organic gases (ROG), nitrous oxides (NO_x), and sunlight. Ozone is a regional pollutant that is generated over a large area and is transported and spread by the wind.	Ozone is a secondary pollutant; thus, it is not emitted directly into the lower level of the atmosphere. The primary sources of ozone precursors (ROG and NO_x) are mobile sources (on-road and off-road vehicle exhaust).
	8 Hours	0.070 ppm	0.070 ppm			
Carbon monoxide (CO)	1 Hour	20 ppm	35 ppm	Ranges depending on exposure: slight headaches; nausea; aggravation of angina pectoris (chest pain) and other aspects of coronary heart disease; decreased exercise tolerance in persons with peripheral vascular disease and lung disease; impairment of central nervous system functions; possible increased risk to fetuses; death.	CO is a colorless, odorless, toxic gas. CO is somewhat soluble in water; therefore, rainfall and fog can suppress CO conditions. CO enters the body through the lungs, dissolves in the blood, replaces oxygen as an attachment to hemoglobin, and reduces available oxygen in the blood.	CO is produced by incomplete combustion of carbon-containing fuels (e.g., gasoline, diesel fuel, and biomass). Sources include motor vehicle exhaust, industrial processes (metals processing and chemical manufacturing), residential woodburning, and natural sources.
	8 Hours	9.0 ppm	9 ppm			
Nitrogen dioxide[b] (NO_2)	1 Hour	0.18 ppm	0.100 ppm	Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; contributions to atmospheric discoloration; increased visits to hospital for respiratory illnesses.	During combustion of fossil fuels, oxygen reacts with nitrogen to produce nitrogen oxides—NO_x (NO, NO_2, NO_3, N_2O, N_2O_3, N_2O_4, and N_2O_5). NO_x is a precursor to ozone, PM_{10}, and $PM_{2.5}$ formation. NO_x can react with compounds to form nitric acid and related small particles and result in particulate matter (PM) related health effects.	NO_x is produced in motor vehicle internal combustion engines and fossil fuel-fired electric utility and industrial boilers. Nitrogen dioxide forms quickly from NO_x emissions. NO_2 concentrations near major roads can be 30 to 100 percent higher than those at monitoring stations.
	Annual	0.030 ppm	0.053 ppm			

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Sulfur dioxide[c] (SO_2)	1 Hour	0.25 ppm	0.075 ppm	Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient sulfur dioxide levels. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.	Sulfur dioxide is a colorless, pungent gas. At levels greater than 0.5 ppm, the gas has a strong odor, similar to rotten eggs. Sulfur oxides (SO_x) include sulfur dioxide and sulfur trioxide. Sulfuric acid is formed from sulfur dioxide, which can lead to acid deposition and can harm natural resources and materials. Although sulfur dioxide concentrations have been reduced to levels well below State and federal standards, further reductions are desirable because sulfur dioxide is a precursor to sulfate and PM_{10}.	Human caused sources include fossil fuel combustion, mineral ore processing, and chemical manufacturing. Volcanic emissions are a natural source of sulfur dioxide. The gas can also be produced in the air by dimethylsulfide and hydrogen sulfide. Sulfur dioxide is removed from the air by dissolution in water, chemical reactions, and transfer to soils and ice caps. The sulfur dioxide levels in the State are well below the maximum standards.
	3 Hours	—	0.5 ppm			
	24 Hours	0.04 ppm	0.14 (for certain areas)			
	Annual	—	0.030 ppm (for certain areas)			
Particulate matter (PM_{10})	24 hours	50 µg/m^3	150 µg/m^3	- Short-term exposure (hours/days): irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; those with heart disease can suffer heart attacks and arrhythmias. - Long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; death.	Suspended particulate matter is a mixture of small particles that consist of dry solid fragments, droplets of water, or solid cores with liquid coatings. The particles vary in shape, size, and composition. PM_{10} refers to particulate matter that is between 2.5 and 10 microns in diameter, (one micron is one-millionth of a meter). $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter, about one-thirtieth the size of the average human hair.	Stationary sources include fuel or wood combustion for electrical utilities, residential space heating, and industrial processes; construction and demolition; metals, minerals, and petrochemicals; wood products processing; mills and elevators used in agriculture; erosion from tilled lands; waste disposal, and recycling. Mobile or transportation related sources are from vehicle exhaust and road dust. Secondary particles form from reactions in the atmosphere.
	Mean	20 µg/m^3	—			
Particulate matter ($PM_{2.5}$)	24 Hours	—	35 µg/m^3			
	Annual	12 µg/m^3	12.0 µg/m^3			
Visibility reducing particles	8 Hours	See note below[d]				

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Sulfates	24 Hours	25 µg/m^3	—	(a) Decrease in ventilatory function; (b) aggravation of asthmatic symptoms; (c) aggravation of cardio-pulmonary disease; (d) vegetation damage; (e) degradation of visibility; (f) property damage.	The sulfate ion is a polyatomic anion with the empirical formula SO_4^{2-}. Sulfates occur in combination with metal and/or hydrogen ions. Many sulfates are soluble in water.	Sulfates are particulates formed through the photochemical oxidation of sulfur dioxide. In California, the main source of sulfur compounds is combustion of gasoline and diesel fuel.
Lead[e]	30-days	1.5 µg/m^3	—	Lead accumulates in bones, soft tissue, and blood and can affect the kidneys, liver, and nervous system. It can cause impairment of blood formation and nerve conduction, behavior disorders, mental retardation, neurological impairment, learning deficiencies, and low IQs.	Lead is a solid heavy metal that can exist in air pollution as an aerosol particle component. Leaded gasoline was used in motor vehicles until around 1970. Lead concentrations have not exceeded State or federal standards at any monitoring station since 1982.	Lead ore crushing, lead ore smelting, and battery manufacturing are currently the largest sources of lead in the atmosphere in the United States. Other sources include dust from soils contaminated with lead-based paint, solid waste disposal, and crustal physical weathering.
	Quarter	—	1.5 µg/m^3			
	Rolling 3-month average	—	0.15 µg/m^3			
Vinyl chloride[e]	24 Hours	0.01 ppm	—	Short-term exposure to high levels of vinyl chloride in the air causes central nervous system effects, such as dizziness, drowsiness, and headaches. Epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of a rare cancer, liver angiosarcoma, and have suggested a relationship between exposure and lung and brain cancers.	Vinyl chloride, or chloroethene, is a chlorinated hydrocarbon and a colorless gas with a mild, sweet odor. In 1990, ARB identified vinyl chloride as a toxic air contaminant and estimated a cancer unit risk factor.	Most vinyl chloride is used to make polyvinyl chloride plastic and vinyl products, including pipes, wire and cable coatings, and packaging materials. It can be formed when plastics containing these substances are left to decompose in solid waste landfills. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites.
Hydrogen sulfide	1 Hour	0.03 ppm	—	High levels of hydrogen sulfide can cause immediate respiratory arrest. It can irritate the eyes and respiratory tract and cause headache, nausea, vomiting, and cough. Long exposure can cause pulmonary edema.	Hydrogen sulfide (H_2S) is a flammable, colorless, poisonous gas that smells like rotten eggs.	Manure, storage tanks, ponds, anaerobic lagoons, and land application sites are the primary sources of hydrogen sulfide. Anthropogenic sources include the combustion of sulfur containing fuels (oil and coal).

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Volatile organic compounds (VOC)		There are no State or federal standards for VOCs because they are not classified as criteria pollutants.		Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations because of interference with oxygen uptake. In general, concentrations of VOCs are suspected to cause eye, nose, and throat irritation; headaches; loss of coordination; nausea; and damage to the liver, the kidneys, and the central nervous system. Many VOCs have been classified as toxic air contaminants.	ROGs, or VOCs, are defined as any compound of carbon—excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate—that participates in atmospheric photochemical reactions. Although there are slight differences in the definition of ROGs and VOCs, the two terms are often used interchangeably.	Indoor sources of VOCs include paints, solvents, aerosol sprays, cleansers, tobacco smoke, etc. Outdoor sources of VOCs are from combustion and fuel evaporation. A reduction in VOC emissions reduces certain chemical reactions that contribute to the formulation of ozone. VOCs are transformed into organic aerosols in the atmosphere, which contribute to higher PM_{10} and lower visibility.
Benzene		There are no ambient air quality standards for benzene.		Short-term (acute) exposure of high doses from inhalation of benzene may cause dizziness, drowsiness, headaches, eye irritation, skin irritation, and respiratory tract irritation, and at higher levels, loss of consciousness can occur. Long-term (chronic) occupational exposure of high doses has caused blood disorders, leukemia, and lymphatic cancer.	Benzene is VOC. It is a clear or colorless light-yellow, volatile, highly flammable liquid with a gasoline-like odor. The EPA has classified benzene as a "Group A" carcinogen.	Benzene is emitted into the air from fuel evaporation, motor vehicle exhaust, tobacco smoke, and from burning oil and coal. Benzene is used as a solvent for paints, inks, oils, waxes, plastic, and rubber. Benzene occurs naturally in gasoline at one to 2 percent by volume. The primary route of human exposure is through inhalation.
Diesel particulate matter (DPM)		There are no ambient air quality standards for DPM.		Some short-term (acute) effects of DPM exposure include eye, nose, throat, and lung irritation, coughs, headaches, lightheadedness, and nausea. Studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Human studies on the carcinogenicity of DPM demonstrate an increased risk of lung cancer, although the increased risk	Diesel PM is a source of $PM_{2.5}$—diesel particles are typically 2.5 microns and smaller. Diesel exhaust is a complex mixture of thousands of particles and gases that is produced when an engine burns diesel fuel. Organic compounds account for 80 percent of the total particulate matter mass, which consists of compounds such as hydrocarbons and their	Diesel exhaust is a major source of ambient particulate matter pollution in urban environments. Typically, the main source of DPM is from combustion of diesel fuel in diesel-powered engines. Such engines are in on-road vehicles such as diesel trucks, off-road construction vehicles, diesel electrical generators, and

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
				cannot be clearly attributed to diesel exhaust exposure.	derivatives, and polycyclic aromatic hydrocarbons and their derivatives. Fifteen polycyclic aromatic hydrocarbons are confirmed carcinogens, a number of which are found in diesel exhaust.	various pieces of stationary construction equipment.

Notes:
$\mu g/m^3$ = micrograms per cubic meter
30-day = 30-day average
Annual = Annual Arithmetic Mean
ppm = parts per million (concentration)
Quarter = Calendar quarter

[a] Federal standard refers to the primary national ambient air quality standard, or the levels of air quality necessary, with an adequate margin of safety to protect the public health. All standards listed are primary standards except for 3-Hour SO_2, which is a secondary standard. A secondary standard is the level of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[b] To attain the 1-hour nitrogen dioxide national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (0.100 ppm).

[c] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[d] Visibility reducing particles: In 1989, ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

[e] ARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Source of effects, properties, and sources: South Coast Air Quality Management District (South Coast AQMD) 2007; California Environmental Protection Agency (Cal/EPA) 2002; California Air Resources Board (ARB) 2009; United States Environmental Protection Agency (EPA) 2003, 2009, 2010, 2011, and 2012; National Toxicology Program 2011 and 2011. Source of standards: California Air Resources Board (ARB) 2013.

THIS PAGE INTENTIONALLY LEFT BLANK

Several pollutants listed in Table 3.3-4 are not addressed in this analysis. Visibility reducing particles are not explicitly addressed in this analysis because particulate matter is addressed as PM_{10} and $PM_{2.5}$ and thus evaluated accordingly (see below). In addition, given the nature of the proposed uses, no components of the project would result in vinyl chloride or hydrogen sulfide emissions in any substantial quantity and thus are not addressed further.

Toxic Air Contaminants Health Effects

A toxic air contaminant (TAC) is defined as an air pollutant that may cause or contribute to an increase in mortality or serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations. The California Almanac of Emissions and Air Quality presents the relevant concentration and cancer risk data for the 10 TACs that pose the most substantial health risk in California based on available data. The 10 TACs are acetaldehyde, benzene, 1.3-butadiene, carbon tetrachloride, hexavalent chromium, para-dichlorobenzene, formaldehyde, methylene chloride, perchloroethylene, and diesel particulate matter (DPM).

Some studies indicate that DPM poses the greatest health risk among the TACs listed above. A 10-year research program demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic health risk.[4] In addition to increasing the risk of lung cancer, exposure to diesel exhaust can have other health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. Diesel exhaust is a major source of fine particulate pollution as well, and studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems.

DPM differs from other TACs in that it is not a single substance, but a complex mixture of hundreds of substances. Although DPM is emitted by diesel-fueled, internal combustion engines, the composition of the emissions varies, depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present. Unlike the other TACs, however, no ambient monitoring data are available for DPM because no routine measurement method currently exists. The ARB has made preliminary concentration estimates based on a DPM exposure method. This method uses the ARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies to estimate concentrations of DPM.

Limited data on levels and health risks attributable to the top 10 TACs listed above is available from the ARB as part of its California Almanac of Emissions and Air Quality—2013 Edition.[5] Risks associated with DPM emissions are only provided for the year 2000 and have not been updated in the Almanac. Although recent editions of the Almanac do not provide estimated risk, they do provide emission

[4] California Air Resources Board (ARB). 1998. Initial Statement of Reasons for Rulemaking, Staff Report, Proposed Identification of Diesel Exhaust As A Toxic Air Contaminant. Website: https://ww2.arb.ca.gov/sites/default/files/classic//toxics/dieseltac/staffrpt.pdf. Accessed February 16, 2021.

[5] California Air Resources Board (ARB). 2013. California Almanac of Emissions and Air Quality – 2013 Edition. Website: https://ww2.arb.ca.gov/our-work/programs/resource-center/technical-assistance/air-quality-and-emissions-data/almanac. Accessed February 16, 2021.

inventories for DPM for later years. The 2013 Almanac provides emission inventory trends for DPM from 2000 through 2035. The 2013 Almanac reports that DPM emissions were reduced in the Air Basin from 16 tons per day in 2000 to 11 tons per day in 2010, a 31 percent decrease. DPM emissions in the San Joaquin Valley are projected to decrease to 6 tons per day by 2015, which would represent a 62 percent reduction from year 2000 levels. The ARB predicts a reduction to 3 tons per day by 2035, which would represent an 81 percent reduction from year 2000 levels. Continued implementation of the ARB's Diesel Risk Reduction Plan is expected to provide continued reductions in DPM through 2020 and beyond through regulations on this source.[6]

Asbestos

Asbestos is the name given to a number of naturally occurring fibrous silicate minerals that have been mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The three most common types of asbestos are chrysotile, amosite, and crocidolite. Chrysotile, also known as white asbestos, is the most common type of asbestos found in buildings. Chrysotile makes up approximately 90 to 95 percent of all asbestos contained in buildings in the United States. Exposure to asbestos is a health threat; exposure to asbestos fibers may result in health issues such as lung cancer, mesothelioma (a rare cancer of the thin membranes lining the lungs, chest, and abdominal cavity), and asbestosis (a non-cancerous lung disease that causes scarring of the lungs). Exposure to asbestos can occur during demolition or remodeling of buildings that were constructed prior to the 1977 ban on asbestos for use in buildings. Exposure to naturally occurring asbestos can occur during soil-disturbing activities in areas with deposits present.

Lead

Lead is a naturally occurring element found in small amounts in the earth's crust. While it has some beneficial uses, it can be toxic to human and animals, causing health effects.[7] Lead is known to cause a range of health effects, from behavioral problems and learning disabilities, to seizures and death. Exposure to building materials containing lead, such as lead-based paint, during land use development activities can occur during demolition of older buildings. Children exposed to lead can suffer from a variety of symptoms, including lowered IQ, damage to the brain and nervous system, learning and behavioral difficulties, slowed growth, hearing problems, and headaches. Adults exposed to lead can suffer from reproductive complications, high blood pressure and hypertension, nerve disorders, memory and concentration challenges, and muscle and joint pain.[8]Federal

Air pollutants are regulated at the national, state, and air basin or county level; each agency has a different level of regulatory responsibility. The EPA regulates at the national level. The ARB regulates at the State level. The Valley Air District regulates at the air basin level.

[6] California Air Resources Board (ARB). 2013. California Almanac of Emissions and Air Quality – 2013 Edition. Website: https://ww2.arb.ca.gov/our-work/programs/resource-center/technical-assistance/air-quality-and-emissions-data/almanac. Accessed February 16, 2021.

[8] United States Environmental Protection Agency (EPA). 2021. What are some of the health effects of lead? Website: https://www.epa.gov/lead/what-are-some-health-effects-lead. Accessed July 20, 2021.

The EPA is responsible for national and interstate air pollution issues and policies. The EPA sets national vehicle and stationary source emission standards, oversees approval of all State Implementation Plans, provides research and guidance for air pollution programs, and sets National Ambient Air Quality Standards, also known as the federal standards, or NAAQS, described earlier.

A State Implementation Plan is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain federal standards. The State Implementation Plan for the State of California is administered by the ARB, which has overall responsibility for statewide air quality maintenance and air pollution prevention. California's State Implementation Plan incorporates individual federal attainment plans for regional air districts—an air district prepares their federal attainment plan, which is sent to ARB to be approved and incorporated into the California State Implementation Plan. Federal attainment plans include the technical foundation for understanding air quality (e.g., emission inventories and air quality monitoring), control measures and strategies, and enforcement mechanisms. The most recent attainment plans for the Valley Air District are the 2007 8-hour Ozone Attainment Plan and the 2012 $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ standard. The Air Basin is designated as an extreme ozone nonattainment area for the EPA's 2008 8-hour ozone standard of 75 ppb. The EPA Administrator signed the Final Rule revising the 8-hour ozone standard to 70 ppm on October 1, 2015. Adoption of a new standard requires an implementation process that includes making attainment designations and the development of new plans to attain the standard based on each area's designation. The District's Governing Board approved the 2016 Plan for the 2008 8-Hour Ozone Standard on June 16, 2016. The comprehensive strategy in this plan will reduce oxides of nitrogen (NO_x) emissions by over 60 percent between 2012 and 2031 and will bring the San Joaquin Valley into attainment of EPA's 2008 8-hour ozone standard as expeditiously as practicable, no later than December 31, 2031.

Areas designated nonattainment must develop Air Quality Plans (AQPs) and regulations to achieve standards by specified dates, depending on the severity of the exceedances. For much of the country, implementation of federal motor vehicle standards and compliance with federal permitting requirements for industrial sources are adequate to attain air quality standards on schedule. For many areas of California, however, additional State and local regulation is required to achieve the standards. Regulations adopted by California are described below.

State

Low Emission Vehicle Program

The ARB first adopted Low Emission Vehicle (LEV) program standards in 1990. These first LEV standards ran from 1994 through 2003. LEV II regulations, running from 2004 through 2010, represent continuing progress in emission reductions. As the State's passenger vehicle fleet continues to grow and more sport utility vehicles and pickup trucks are used as passenger cars rather than work vehicles, the more stringent LEV II standards were adopted to provide reductions necessary for California to meet federally mandated clean air goals outlined in the 1994 State Implementation Plan. In 2012, the ARB adopted the LEV III amendments to California's LEV regulations. These amendments, also known as the Advanced Clean Car Program, include more stringent emission standards for model years 2017 through 2025 for both criteria pollutants and greenhouse gas (GHG) emissions for new passenger vehicles.

On September 23, 2020, Governor Gavin Newsom issued Executive Order N-79-20 establishing a goal that 100 percent of new passenger cars and trucks sold in California shall be zero-emission by 2035. The Executive Order also sets a goal that, where feasible, all operations include zero-emission medium- and heavy-duty trucks by 2045, and drayage trucks by 2035. Off-road vehicles have a goal to transition to 100 percent zero-emission vehicles by 2035, where feasible.

On-Road Heavy-Duty Vehicle Program

The ARB has adopted standards for emissions from various types of new on-road heavy-duty vehicles. Section 1956.8, Title 13, California Code of Regulations contains California's emission standards for on-road heavy-duty engines and vehicles, and test procedures. The ARB has also adopted programs to reduce emissions from in-use heavy-duty vehicles including the Heavy-Duty Diesel Vehicle Idling Reduction Program, the Heavy-Duty Diesel In-Use Compliance Program, the Public Bus Fleet Rule and Engine Standards, and the School Bus Program and others.

California Air Resources Board Regulation for In-Use Off-Road Diesel Vehicles

On July 26, 2007, the ARB adopted a regulation to reduce DPM and NO_x emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. Such vehicles are used in construction, mining, and industrial operations. The regulation limits idling to no more than five consecutive minutes, requires reporting and labeling, and requires disclosure of the regulation upon vehicle sale. The ARB is enforcing that part of the rule with fines up to $10,000 per day for each vehicle in violation. Performance requirements of the rule are based on a fleet's average NO_x emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirements, making the first compliance deadline January 1, 2014, for large fleets (over 5,000 horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less).

The latest amendments to the Truck and Bus regulation became effective on December 31, 2014. The amended regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter (PM) filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent.

The regulation applies to nearly all privately and federally owned diesel-fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. The regulation provides a variety of flexibility options tailored to fleets operating low use vehicles, fleets operating in selected vocations like agricultural and construction, and small fleets of three or fewer trucks.[9]

[9] California Air Resources Board (ARB). 2021. Truck and Bus Regulation. Website: http://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm. Accessed February 16, 2021.

California Air Resources Board Airborne Toxic Control Measure for Asbestos

In July 2001, the ARB approved an Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying and surface mining operations to minimize emissions of naturally occurring asbestos. The regulation requires application of Best Management Practices (BMPs) to control fugitive dust in areas known to have naturally occurring asbestos and requires notification to the local air district prior to commencement of ground-disturbing activities. The measure establishes specific testing, notification and engineering controls prior to grading, quarrying, or surface mining in construction zones where naturally occurring asbestos is located on projects of any size. There are additional notification and engineering controls at work sites larger than one acre in size. These projects require the submittal of a "Dust Mitigation Plan" and approval by the air district prior to the start of a project.

Construction sometimes requires the demolition of existing buildings where construction occurs. Buildings often include materials containing asbestos; demolition is associated with this project and therefore asbestos exposure could occur as a result of this demolition work. In addition, asbestos is also found in a natural state, known as naturally occurring asbestos. Exposure and disturbance of rock and soil that naturally contain asbestos can result in the release of fibers into the air and consequent exposure to the public. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (serpentinite) and often contains chrysotile asbestos. In addition, another form of asbestos, tremolite, can be found associated with ultramafic rock, particularly near faults. Sources of asbestos emissions include unpaved roads or driveways surfaced with ultramafic rock, construction activities in ultramafic rock deposits, or rock quarrying activities where ultramafic rock is present.

The ARB has an ATCM for construction, grading, quarrying, and surface mining operations, requiring the implementation of mitigation measures to minimize emissions of asbestos-laden dust. The measure applies to road construction and maintenance, construction and grading operations, and quarries and surface mines when the activity occurs in an area where naturally occurring asbestos is likely to be found. Areas are subject to the regulation if they are identified on maps published by the Department of Conservation as ultramafic rock units or if the Air Pollution Control Officer or owner/operator has knowledge of the presence of ultramafic rock, serpentine, or naturally occurring asbestos on the site. The measure also applies if ultramafic rock, serpentine, or asbestos is discovered during any operation or activity. Review of the Department of Conservation maps indicates that no ultramafic rock has been found near the City of Tracy.

Diesel Risk Reduction Plan

The ARB's Diesel Risk Reduction Plan has led to the adoption of new State regulatory standards for all new on-road, off-road, and stationary diesel-fueled engines and vehicles to reduce DPM emissions by about 90 percent overall from year 2000 levels. The projected emission benefits associated with the full implementation of this plan, including federal measures, are reductions in DPM emissions and associated cancer risks of 75 percent by 2010, and 85 percent by 2020.[10]

[10] California Air Resources Board (ARB). 2021. Diesel Risk Reduction Plan. Website: https://ww2.arb.ca.gov/our-work/programs/diesel-risk-reduction-plan. Accessed February 16, 2021.

Regional (San Joaquin Valley Air Pollution Control District)

Ozone Plans

The Air Basin is designated nonattainment of State and federal health-based air quality standards for ozone. To meet CAA requirements for the one-hour ozone standard, the Valley Air District adopted an Extreme Ozone Attainment Demonstration Plan in 2004, with an attainment date of 2010. Although the EPA revoked the federal 1-hour ozone standard effective June 15, 2005, and replaced it with an 8-hour standard, the requirement to submit a plan for that standard remained in effect for the San Joaquin Valley.

The planning requirements for the 1-hour plan remain in effect until replaced by a federal 8-hour ozone attainment plan. The EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan, including revisions to the plan, on March 8, 2010, effective April 7, 2010. However, the Air Basin failed to attain the standard in 2010 and was subject to a $29 million CAA penalty. The penalty is being collected through an additional $12 motor vehicle registration surcharge for each passenger vehicle registered in the Air Basin that will be applied to pollution reduction programs in the region. The District also instituted a more robust ozone episodic program to reduce emissions on days with the potential to exceed the ozone standards. On July 18, 2016, the EPA published in the Federal Register a final action determining that the San Joaquin Valley has attained the 1-hour ozone national ambient air quality standard. This determination is based on the most recent 3-year period (2012–2014) of sufficient, quality-assured, and certified data that was available as of the date that environmental review for the proposed project commenced.[11]

The EPA originally classified the Air Basin as serious nonattainment for the 1997 federal 8-hour ozone standard with an attainment date of 2013. On April 30, 2007, the Valley Air District's Governing Board adopted the 2007 Ozone Plan, which contained analysis showing a 2013 attainment target to be infeasible. The 2007 Ozone Plan details the plan for achieving attainment on schedule with an "extreme nonattainment" deadline of 2024. At its adoption of the 2007 Ozone Plan, the Valley Air District also requested a reclassification to extreme nonattainment. The ARB approved the plan in June 2007, and the EPA approved the request for reclassification to extreme nonattainment on April 15, 2010.

The 2007 Ozone Plan contains measures to reduce ozone and particulate matter precursor emissions to bring the Air Basin into attainment with the federal 8-hour ozone standard. The 2007 Ozone Plan calls for a 75 percent reduction of NO_x and a 25 percent reduction of reactive organic gases (ROG).

Figure 1 displays the anticipated NO_x reductions attributed in the 2007 Ozone Plan.[12] The plan, with innovative measures and a "dual path" strategy, assures expeditious attainment of the federal 8-hour ozone standard for all Air Basin residents. The Valley Air District Governing Board adopted the 2007 Ozone Plan on April 30, 2007. The ARB approved the plan on June 14, 2007. The 2007 Ozone Plan

Website: https://www3.epa.gov/region9/air/actions/pdf/ca/sjv/epa-r09-oar-2016-0164-sjv-1hr-o2-determin-attain-factsheet-2016-06-30.pdf. Accessed February 16, 2021.

[12] San Joaquin Valley Air Pollution Control District (Valley Air District). 2007. 2007 8-Hour Ozone Plan. Website: http://www.valleyair.org/air_quality_plans/docs/AQ_Ozone_2007_Adopted/2007_8HourOzone_CompletePlan.pdf. Accessed February 16, 2021.

requires yet to be determined "Advanced Technology" to achieve additional reductions after 2021, in order to attain the standard at all monitoring stations in the Air Basin by 2024 as allowed for areas designated extreme nonattainment by the CAA.

The Air Basin is designated as an extreme ozone nonattainment area for the EPA's 2008 8-hour ozone standard of 75 ppb. The plan to address this standard was developed for the region to attain EPA's 2008 8-hour ozone standard by December 31, 2031.

State ozone standards do not have an attainment deadline but require implementation of all feasible measures to achieve attainment at the earliest date possible. This is achieved through compliance with the federal deadlines and control measure requirements.

Figure 1: San Joaquin Valley NO_x Emissions Forecast

Particulate Matter Plans

The Air Basin was designated nonattainment of State and federal health-based air quality standards for PM_{10}. The Air Basin is also designated nonattainment of State and federal standards for $PM_{2.5}$.

To meet CAA requirements for the PM_{10} standard, the District adopted a PM_{10} Attainment Demonstration Plan (Amended 2003 PM_{10} Plan and 2006 PM_{10} Plan), which had an attainment date of 2010. The Valley Air District adopted the 2007 PM_{10} Maintenance Plan in September 2007 to assure the San Joaquin Valley's continued attainment of the EPA's PM_{10} standard. The EPA designated the San Joaquin Valley as an attainment/maintenance area for PM_{10} on September 25, 2008. Although the San Joaquin Valley has exceeded the standard since then, those days were considered exceptional events that are not considered a violation of the standard for attainment purposes.

The 2008 $PM_{2.5}$ Plan builds upon the comprehensive strategy adopted in the 2007 Ozone Plan to bring the Air Basin into attainment of the 1997 national standards for $PM_{2.5}$. The EPA has identified

NO_x and sulfur dioxide as precursors that must be addressed in AQPs for the 1997 $PM_{2.5}$ standards. The 2008 $PM_{2.5}$ Plan is a continuation of the District's strategy to improve the air quality in the Air Basin. The EPA issued final approval of the 2008 $PM_{2.5}$ Plan on November 9, 2011, which became effective on January 9, 2012. The EPA approved the emissions inventory, the reasonably available control measures/reasonably available control technology demonstration, reasonable further progress demonstration, attainment demonstration and associated air quality modeling, and the transportation conformity motor vehicle emissions budgets. The EPA also granted California's request to extend the attainment deadline for the San Joaquin Valley to April 5, 2015, and approved commitments to measures and reductions by the Valley Air District and the ARB. Finally, it disapproved the State Implementation Plan's contingency provisions and issued a protective finding for transportation conformity determinations.

In December 2012, the Valley Air District adopted the 2012 $PM_{2.5}$ Plan to bring the San Joaquin Valley into attainment of the EPA's 2006 24-hour $PM_{2.5}$ standard of 35 $\mu g/m^3$. The ARB approved the District's 2012 $PM_{2.5}$ Plan for the 2006 standard at a public hearing on January 24, 2013.[13] This plan seeks to bring the San Joaquin Valley into attainment with the standard by 2019, with the expectation that most areas will achieve attainment before that time.

The 2015 Plan for the 1997 $PM_{2.5}$ Standard, approved by the District Governing Board on April 16, 2015, will bring the San Joaquin Valley into attainment of EPA's 1997 $PM_{2.5}$ standard as expeditiously as practicable, but no later than December 31, 2020. However, this did not occur. Therefore, the plan was required to request reclassification to serious nonattainment and to extend the attainment date from 2018 to 2020.[14]

San Joaquin Valley Air Pollution Control District Rules and Regulations

The following Valley Air District rules and regulations are relevant to this analysis:

Rule 4102—Nuisance. The purpose of this rule is to protect the health and safety of the public and applies to any source operation that emits or may emit air contaminants or other materials.

Rule 4601—Architectural Coatings. The purpose of this rule is to limit volatile organic compounds (VOC) emissions from architectural coatings. Emissions are reduced by limits on VOC content and providing requirements on coatings storage, cleanup, and labeling.

Rule 4641—Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations. The purpose of this rule is to limit VOC emissions from asphalt paving and maintenance operations. If asphalt paving will be used, then the paving operations will be subject to Rule 4641.

Regulation VIII—Fugitive PM_{10} Prohibitions. Rules 8011-8081 are designed to reduce PM_{10} emissions (predominantly dust/dirt) generated by human activity, including construction and demolition activities, road construction, bulk materials storage, paved and unpaved roads, carryout

[13] San Joaquin Valley Air Pollution Control District (Valley Air District). 2012. 2012 $PM_{2.5}$ Plan. Website: https://www.valleyair.org/Air_Quality_Plans/PM25Plan2012/CompletedPlanbookmarked.pdf. Accessed February 16, 2021.

[14] San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. 2015 Plan for the 1997 $PM_{2.5}$ Standard. Website: http://www.valleyair.org/air_quality_plans/docs/pm25-2015/2015-pm2.5-plan_bookmarked.pdf. Accessed February 16, 2021.

and trackout, etc. All development projects that involve soil disturbance are subject to at least one provision of the Regulation VIII series of rules.

Rule 9510—Indirect Source Review. This rule reduces the impact of NO_x and PM_{10} emissions from growth within the Air Basin. The rule places application and emission reduction requirements on development projects meeting applicability criteria in order to reduce emissions through on-site mitigation, off-site Valley Air District-administered projects, or a combination of the two. The proposed project must comply with Rule 9510 because it would develop more than 25,000 square feet of light industrial uses.

California Environmental Quality Act

The Valley Air District provides guidance and thresholds for California Environmental Quality Act (CEQA) air quality and GHG analyses. The result of this guidance, as well as State regulations to control air pollution, is an overall improvement in the Air Basin. In particular, the Valley Air District's 2015 GAMAQI states the following:

1. The District's Air Quality Attainment Plans include measures to promote air quality elements in county and city general plans as one of the primary indirect source programs. The general plan is the primary long range planning document used by cities and counties to direct development. Since air districts have no authority over land use decisions, it is up to cities and counties to ensure that their general plans help achieve air quality goals. Section 65302.1 of the California Government Code requires cities and counties in the San Joaquin Valley to amend appropriate elements of their general plans to include data, analysis, comprehensive goals, policies, and feasible implementation strategies to improve air quality in their next housing element revisions.
2. The Air Quality Guidelines for General Plans (AQGGP), adopted by the Valley Air District in 1994 and amended in 2005, is a guidance document containing goals and policy examples that cities and counties may want to incorporate into their General Plans to satisfy Section 65302.1. When adopted in a general plan and implemented, the suggestions in the AQGGP can reduce vehicle trips and miles traveled and improve air quality. The specific suggestions in the AQGGP are voluntary. The Valley Air District strongly encourages cities and counties to use their land use and transportation planning authority to help achieve air quality goals by adopting the suggested policies and programs.

City of Tracy

The City's air quality goals and policies from the Air Quality Element and Circulation Element that are relevant to this analysis are listed below.[15]

[15] City of Tracy. 2011. City of Tracy General Plan. February 1. Website: https://www.ci.tracy.ca.us/documents/2011_General_Plan.pdf. Accessed February 16, 2021.

City of Tracy Air Quality Goals and Policies

Air Quality Element

Goal AQ-1–Improved air quality and reduced greenhouse gas emissions

Objective AQ-1.1 Improve air quality and reduce greenhouse gas emissions through land use planning decisions.

Policies

Policy P1 The City shall promote land use patterns that reduce the number and length of motor vehicle trips.

Objective AQ-1.2 Promote development that minimizes air pollutant and greenhouse gas emissions and their impact on sensitive receptors as a result of indirect and stationary sources.

Policies

Policy P3 Developers shall implement best management practices to reduce air pollutant emissions associated with the construction and operation of development projects.

Policy P4 New development projects should incorporate energy efficient design features for HVAC, lighting systems and insulation that exceed Title 24.

Policy P5 Use of solar water and pool heaters is encouraged.

Policy P6 Installation of solar voltaic panels on new homes and businesses shall be encouraged.

Policy P7 Trees should be planted on the south- and west-facing sides of new buildings or building undergoing substantial renovation in order to reduce energy usage.

Policy P9 New developments shall follow the current requirements of the SJVAPCD [Valley Air District] with respect to woodburning fireplaces and heaters.

Circulation Element

Goal CIR-1: A roadway system that provides access and mobility for all of Tracy's residents and businesses while maintaining the quality of life in the community.

Objective CIR-1.1: Implement a hierarchical street system in which each street serves a specific, primary function and is sensitive to the context of the land uses served.

Policies

Policy P3 The City shall continue to apply traffic mitigation fee programs to fund transportation infrastructure, based on a fair share of facility use.

Policy P6 The Roadway Master Plan update shall identify necessary improvements to various intersections on I-205 and I-580 based on land use designations and with particular attention to Terminal Access Routes in accordance with Surface Transportation Assistance Act of 1982 (STAA).

Objective CIR-1.2: Provide a high level of street connectivity.

Policies

Policy P3 New development shall be designed to provide vehicular, bicycle and pedestrian connections with adjacent developments.

Policy P5 New development shall be designed with a grid or modified grid pattern to facilitate traffic flows and to provide multiple connections to arterial streets.

Goal CIR-3: Safe and convenient bicycle and pedestrian travel as alternative modes of transportation in and around the City.

Objective CIR-3.1: Achieve a comprehensive system of citywide bikeways and pedestrian facilities.

Policies

Policy P6 New development shall include pedestrian and bicycle facilities internal to the development and that connect to citywide facilities, such as parks, schools and recreational corridors, as well as adjacent development and other services.

Policy P7 New development sites for commercial, employment, educational, recreational and park-and-ride land uses shall provide bicycle parking and/or storage facilities.

Economic Development Element

Goal ED-1: A diversified and sustainable local economy.

Objective ED-1.2: Support and encourage a sustainable local economy.

Policies

Policy P1 The City shall encourage businesses that use green practices.

Policy P2 The City shall conduct public education and outreach to support employment opportunities that minimize the need for automobile trips, such as live/work, telecommuting, satellite work centers, and home occupations, in addition to mixed-use development strategies.

Objective ED-6.2: Support infill development of commercial and industrial properties within the city limits.

Policies

Policy P1 The City shall promote the development and redevelopment of City infill areas.

Policy P2 A balanced mix of retail, restaurant, and other services should be encouraged throughout the City.

Northeast Industrial Specific Plan

The City of Tracy adopted the Northeast Industrial Specific Plan on July 17, 2012. The City's air quality objectives, goals, and policies from the Northeast Industrial Specific Plan that are relevant to this analysis are listed below.[16]

Parking and On-site Vehicular Circulation

- Parking, on-site circulation, and loading area standards shall be as required by the provisions of Title 10, Article 26, Off-Street Parking Requirements of the Tracy Municipal Code unless modified below or as part of the Development Review approval.
- Parking lots containing 10-20 spaces may include a maximum of 20 percent of the total number of spaces for compact cars. These spaces shall be designed and marked in accordance with City standards and distributed throughout the lot. Parking areas containing 20 or more spaces may include a maximum of 30 percent of the total number of spaces for compact cars.
- Warehouse/Storage off-street parking standards:
  - One space per 1,000 square feet of the first 20,000 square feet of gross floor area, plus one space per 2,000 square feet of the second 20,000 square feet of gross floor area, plus one space per 4,000 square feet of the remaining square feet of gross floor area.

Environmental Performance Standards

- No use shall be permitted to exist or operate on any lot which:
  - Emits dust, sweepings, dirt, cinders, fumes, odors, radiation, gases and vapors, or discharges liquid or solid wastes or other harmful matter into the atmosphere or any body of water which may, according to the appropriate agency, adversely affect the health and safety persons within the area or the health and safety of persons in adjacent areas or the use of adjacent properties.
  - Produces intense glare or heat, unless such use is performed only within an enclosed or screened area, and then only in such manner that glare, or heat emitted will not be discernible from any exterior lot line.
  - Allows the visible emissions of smoke (outside any building) other than the exhausts emitted by motor vehicles or other transportation facilities or any emissions in violation of any regulation of any public body having jurisdiction. This requirement shall also be applicable to the disposal of trash and waste materials.
- Hazardous Wastes and Water Pollutants
  - Industries regularly using significant quantities of hazardous chemicals as defined by State Law in the course of their operations shall be required to obtain a Conditional Use Permit.

[16] City of Tracy. 2012. City of Tracy Northeast Industrial Specific Plan. July 17. Website: https://www.ci.tracy.ca.us/documents/Northeast_Industrial_Specific_Plan.pdf. Accessed February 16, 2021.

3.3.4 - Project Impacts and Mitigation Measures

Significance Criteria

For purposes of this proposed project, the City, in its discretion, is utilizing CEQA Guidelines' Appendix G Environmental Checklist, to determine whether impacts to air quality are significant environmental effects.

As discussed below, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

Would the project:

a) Conflict with or obstruct implementation of the applicable air quality plan?

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?

c) Expose sensitive receptors to substantial pollutant concentrations?

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Approach to Analysis

While the final determination of whether a project is significant is within the purview of the Lead Agency pursuant to Section 15064(b) of the CEQA Guidelines, the Valley Air District recommends that its quantitative air pollution thresholds be used to determine the significance of project emissions. If the Lead Agency finds that the project would exceed these air pollution thresholds, the project should be considered to have significant air quality impacts. The applicable Valley Air District thresholds and methodologies are contained under each impact statement below, as the City, in its discretion, has determined to utilize these thresholds and methodologies, which are based on scientific and factual data.

This analysis was performed consistent with the guidance and methodologies provided by the Valley Air District's GAMAQI.[17] Based on Valley Air District New Source Review (NSR) offset requirements for stationary sources, the Valley Air District has established thresholds of significance for criteria pollutant emissions, shown in Table 3.3-5. These thresholds apply to the project because these air pollutants would be generated during project construction and operation and constitute criteria pollutants or precursor emissions for criteria pollutants, which are regulated by the federal and State Clean Air Acts.

[17] San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. Guidance for Assessing and Mitigating Air Quality Impact. Website: http://www.valleyair.org/transportation/GAMAQI_12-26-19.pdf Accessed January 28, 2021.

Table 3.3-5: San Joaquin Valley Air Pollution Control District Significance Thresholds

Pollutant	Construction Thresholds (TPY)	Operational Thresholds (TPY)	
		Permitted Equipment and Activities	Non-Permitted Equipment and Activities
ROG	10	10	10
NO_X	10	10	10
CO	100	100	100
SO_X	27	27	27
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15

Notes:
CO = carbon monoxide
NO_X = oxides of nitrogen
PM_{10} = particulate matter with aerodynamic diameter less than 2.5 microns
$PM_{2.5}$ = particulate matter with aerodynamic diameter less than 10 microns
ROG = reactive organic gases
SO_X = oxides of sulfur
TPY = tons per year
Source:
San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. Guidance for Assessing and Mitigating Air Quality Impact. Website: http://www.valleyair.org/transportation/GAMAQI_12-26-19.pdf Accessed January 28, 2021.

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following significance determinations. As noted above, the City, in its discretion, has decided to rely upon the foregoing significance criteria for purposes of this analysis.

Impact Evaluation

Air Quality Management Plan Consistency

Impact AIR-1: **The proposed project could conflict with or obstruct implementation of the applicable air quality plan.**

The CEQA Guidelines indicate that a significant impact would occur if the proposed project would conflict with or obstruct implementation of the applicable AQP. The GAMAQI does not provide specific guidance on analyzing conformity with the AQP. Therefore, for the reasons stated below, this Draft EIR proposes the following criteria for determining project consistency with the current AQPs:

- **Criterion 1:** Does the project support the primary goals of the AQP?
- **Criterion 2:** Does the project include applicable control measures from the AQP?
- **Criterion 3:** Does the project disrupt or hinder implementation of any AQP control measures?

The use of the criteria listed above is a standard approach for CEQA analysis of projects in the Valley Air District's jurisdiction, as well as within other air districts, for the following reasons:

- Significant contribution to existing or new exceedances of the air quality standards would be inconsistent with the goal of attaining the air quality standards.
- AQP emissions inventories and attainment modeling are based on growth assumptions for the area within the air district's jurisdiction.
- AQPs rely on a set of air district-initiated control measures as well as implementation of federal and State measures to reduce emissions within their jurisdictions, with the goal of attaining the air quality standards.

AQPs are plans for reaching attainment of air quality standards. The assumptions, inputs, and control measures are analyzed to determine whether the Air Basin can reach attainment for the ambient air quality standards. To show attainment of the standards, the Valley Air District analyzes the growth projections in the valley, contributing factors in air pollutant emissions and formations, and existing and adopted emissions controls. The Valley Air District then formulates a control strategy to reach attainment that includes both State and Valley Air District regulations and other local programs and measures.

Criterion 1

The first criterion for determining whether the proposed project supports the primary goals of the AQP is if the proposed project would not result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQPs. The development of the AQP is based in part on the land use general plan projections of the various cities and counties that constitute the Air Basin. The City of Tracy General Plan Land Use Element designates the project site as Industrial, which is intended to accommodate flex/office space, manufacturing, warehousing and distribution, and ancillary uses for workers' needs. Therefore, the proposed project, which involves the development of light industrial, warehouse and distribution and related uses is considered consistent with the site's General Plan land use designation and its traffic would be included in volumes projected for analysis of the General Plan.

Nonetheless, as further discussed under Impact AIR-2 and Impact AIR-3, the proposed project could create a localized violation of State or federal air quality standards, significantly contribute to cumulative nonattainment pollutant violations, and expose sensitive receptors to substantial pollutant concentrations. The proposed project would be required to implement the mitigation measures identified under Impact AIR-2; however, because full implementation of the mitigation cannot be guaranteed due to potential technical or financial feasibility, the proposed project's potentially significant impact is conservatively identified as significant and unavoidable. The proposed project is, therefore, considered inconsistent with Criterion 1 after the incorporation of mitigation.

Criterion 2

The AQP contains a number of control measures, which are enforceable requirements through the adoption of rules and regulations. A detailed description of rules and regulations that may apply to this project is provided in Section 3.2.3, Regulatory Framework. The proposed project would be

required to comply with all applicable Valley Air District rules and regulations. Therefore, the proposed project would comply with this criterion through compliance with existing regulations.

Criterion 3

A measure of determining whether the proposed project is consistent with the AQPs is if the proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay timely attainment of air quality standards or the interim emission reductions specified in the AQPs. Because of the region's nonattainment status for ozone, $PM_{2.5}$, and PM_{10}, if project-generated emissions of either of the ozone precursor pollutants (ROG and NO_x), PM_{10}, or $PM_{2.5}$ would exceed the Valley Air District's significance thresholds, then the proposed project would be considered to conflict with the attainment plans.

As discussed in Impact AIR-2 below, annual emissions of ROG, NO_x, PM_{10}, and $PM_{2.5}$ associated with the construction of the proposed project (whether phases are constructed sequentially or concurrently) would not exceed the Valley Air District's significance thresholds after incorporation of mitigation. However, emissions of ROG would exceed the Valley Air District's localized significance thresholds if all three project phases were constructed concurrently, even after implementation of identified mitigation. Operation of the proposed project would also have the potential to exceed regional significance thresholds for ROG and NO_X and would have the potential to result in a violation of localized standards after incorporation of mitigation. As shown in Impact AIR-2, the proposed project could also result in CO hotspots that would violate applicable CO standards. Therefore, as the proposed project has the potential to exceed Valley Air District significance thresholds during construction and operation, even after incorporation of the identified mitigation, this impact would remain significant and unavoidable.

Level of Significance Before Mitigation

Potentially Significant Impact

Mitigation Measures

MM AIR-1a NO_X Reduction Measures

Prior to the issuance of grading or building permits for each individual development proposal within the project site, the relevant applicant for each development proposal shall provide documentation to the City of Tracy demonstrating the following NO_X reduction measures would be adhered to during construction activities for the relevant development proposal:

- For all construction equipment and vehicles used during project construction that are equal to or greater than 250 horsepower, the contractor shall use construction equipment and vehicles that meet the United States Environmental Protection Agency (EPA) Tier 4 Final engine standards;
- For all construction equipment and vehicles used during project construction that are less than 250 horsepower, the contractor shall use electric construction equipment and vehicles to the extent feasible, with the exception of handheld generator sets; and

- All generator sets utilized during project construction shall be limited to 5 horsepower and shall only be used to power handheld power tools.

The construction contractor shall maintain reasonable records concerning its efforts to comply with this requirement, including equipment lists. Documentation that each relevant applicant provides to the City shall include, but is not limited to, equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, and engine serial number.

MM AIR-1b "Super-Compliant" Architectural Coatings

Prior to the issuance of grading or building permits for each individual development proposal within the project site, the relevant applicant for each development shall provide the City with documentation demonstrating the use of "Super-Compliant" architectural coatings, as defined by the South Coast Air Quality Management District (South Coast AQMD), during construction of the proposed project. "Super-Compliant" architectural coatings, as defined by the South Coast AQMD, are paints which do not exceed 10 grams of reactive organic gas (ROG) per liter of paint.

MM AIR-1c "Zero-VOC" Consumer Products

The consumer products purchased by the building occupant(s) or by the cleaning business contracted by the building occupant(s) for each on-site use shall consist of water-based or "zero volatile organic compound [VOC]" consumer products, to the maximum extent feasible. "Consumer products," as referred to in this mitigation measure, shall include detergents, cleaning compounds, polishes, and floor finishes. "Consumer products," as referred to in this mitigation measure, shall not include parking lot degreasers, architectural coatings, pesticides, or fertilizers.

MM AIR-1d Clean Truck Fleet

Prior to the issuance of the certificate of occupancy for each individual development proposal within the project site, the relevant applicant for the subject individual development proposal shall provide the City with reasonable documentation demonstrating the use of a clean truck fleet that meets the California Air Resources Board's adopted 2013 Optional Low-NO_X Standard of 0.02 gram of nitrogen oxide (NO_X) per brake horsepower-hour for all heavy-duty trucks during operation of the proposed project, to the maximum extent feasible. If the relevant applicant does not own the truck fleet that will be used during operation of the subject individual development, the relevant applicant shall provide the City with reasonable documentation from the truck fleet owner demonstrating that trucks utilized for operation of the subject individual development will meet the California 2013 Optional Low-NO_X Standard, to the maximum extent feasible. If any change occurs where a new truck fleet is utilized during operation of the subject individual development, the relevant applicant shall provide the City with reasonable

documentation demonstrating that the new truck fleet meets the California 2013 Optional Low-NO_X Standard of 0.02 gram per brake horsepower-hour, to the maximum extent feasible.

Level of Significance After Mitigation

Significant and Unavoidable Impact

Cumulative Criteria Pollutant Emissions

Impact AIR-2: The proposed project could result in a cumulatively considerable net increase of any criteria pollutant for which the region is in nonattainment under an applicable federal or State ambient air quality standard.

If an area is in nonattainment for a criteria pollutant, then the background concentration of that pollutant has historically exceeded the ambient air quality standard. It follows that if a project exceeds the regional threshold for that nonattainment pollutant, then it would result in a cumulatively considerable net increase of that pollutant and result in a significant cumulative impact.

The Air Basin is in nonattainment for PM_{10}, $PM_{2.5}$, and ozone. Therefore, if the proposed project exceeds the regional thresholds for PM_{10}, or $PM_{2.5}$, then it would contribute to a cumulatively considerable impact for those pollutants. If the proposed project exceeds the regional threshold for NO_x or ROG (which are precursors to ozone), then it follows that the project would result in a cumulatively considerable contribution and thus result in a significant cumulative impact for ozone.

Regional emissions include those generated from all on-site and off-site activities. Regional significance thresholds have been established by the Valley Air District because emissions from projects in the Air Basin can potentially contribute to the existing emission burden and possibly affect the attainment and maintenance of ambient air quality standards. Projects within the Air Basin with regional emissions that exceed any of the thresholds presented previously are considered to have a significant regional air quality impact.

Construction Emissions

As discussed in Chapter 2, Project Description, the proposed project involves three different applicants, each of which would have individual development proposals for their respective properties within the project site; based on currently available information, it is assumed the proposed project would involve three separate construction phases. For purposes of this analysis, it is assumed that each construction phase would occur over a 12-month period from April through March. Phase 1 would occur from April 2022 through March 2023, Phase 2 would occur from April 2023 through March 2024, and Phase 3 would occur from April 2024 through March 2025. The default construction equipment utilized in the California Emissions Estimator Model (CalEEMod) were adjusted to match the assumed construction schedule presented in Table 3.3-6 and to preserve CalEEMod's default horsepower-hours during construction activities. For more detailed information on assumptions and calculations utilized in the emissions modeling, please see Appendix B. It should be noted, however, that while the construction schedule anticipated for the proposed project assumes that none of the three project phases would overlap, the potential remains for project

phases to be constructed concurrently. Accordingly, for purposes of a conservative analysis, this evaluation also discloses the potential impacts that would occur if phasing overlapped.

Table 3.3-6: Anticipated Construction Schedule

Construction Activity	Start Date	End Date	Days per Week	Total Workdays
Project Phase 1				
Demolition	04/01/2022	04/28/2022	5	20
Site Preparation	04/29/2022	07/07/2022	5	50
Grading	07/08/2022	12/29/2022	5	125
Building Construction	09/01/2022	02/01/2023	5	110
Paving	02/02/2023	03/01/2023	5	20
Architectural Coating	03/02/2023	03/29/2023	5	20
Project Phase 2				
Site Preparation	04/03/2023	06/09/2023	5	50
Grading	06/10/2023	12/29/2023	5	145
Building Construction	09/01/2023	02/01/2024	5	110
Paving	02/02/2024	02/29/2024	5	20
Architectural Coating	03/01/2024	03/28/2024	5	20
Project Phase 3				
Site Preparation	04/01/2024	06/07/2024	5	50
Grading	06/08/2024	12/27/2024	5	145
Building Construction	12/28/2024	01/31/2025	5	110
Paving	02/03/2025	02/28/2025	5	20
Architectural Coating	03/03/2025	03/28/2025	5	20

Notes:
Anticipated construction schedule reflects the schedule as presented by the co-applicants based on information provided by the project applicants. Detailed methodology and calculations related to adjustments to construction equipment lists and other information to reflect the anticipated construction schedule are contained in Appendix B.

As shown in Table 3.3-7, criteria pollutant emissions would exceed Valley Air District thresholds of significance during unmitigated construction for ROG and NO_X during construction of the proposed project. It should be noted that unmitigated construction emissions incorporate the basic dust control measures required under District Rule 8021, which requires that vehicle speeds on unpaved roads and surfaces be reduced to no more than 15 miles per hour and exposed construction areas are watered during earthmoving activities. Because the proposed project would exceed significance thresholds for ROG and NO_X during construction activities, MMs AIR-1a and AIR-1b would be required during construction of the proposed project to reduce ROG and NO_X emissions to below Valley Air District significance thresholds.

As detailed more fully above, Mitigation Measure (MM) AIR-1a would require the use of Tier 4 Final engines for construction equipment equal to or greater than 250 horsepower and electric alternatives for all construction equipment less than 250 horsepower. MM AIR-1a would not preclude the use of generators; however, generators would be limited to no greater than 5 horsepower under MM AIR-1a to ensure that only handheld power tools are powered by generators and no electric alternative for any specific construction equipment which exceeds 250 horsepower is powered by diesel-fueled generators during construction. As detailed more fully above, MM AIR-1b would require the use of "Super-Compliant" architectural coatings during construction of the proposed project. "Super-Compliant" architectural coatings refer to paints which do not exceed 10 grams of ROG per liter of paint. As shown in Table 3.3-8, construction of the proposed project would not exceed the Valley Air District's annual significance threshold with MMs AIR-1a and AIR-1b incorporated.

It should be noted, however, that while the construction schedule assumed for the proposed project illustrates that none of the three project phases would overlap, the potential remains for project phases to be constructed concurrently. Therefore, Table 3.3-7 and Table 3.3-8 each contain a secondary analysis to illustrate the potential emissions generated during the concurrent construction of all three project phases, representing a reasonable worst-case scenario for purposes of a conservative analysis. As demonstrated therein, construction emissions would be mitigated to below the Valley Air District's annual significance thresholds for ROG and NO_X after implementation of identified mitigation, even if all three project phases were constructed concurrently.

Table 3.3-7: Unmitigated Annual Construction Emissions (Sequential and Concurrent Phasing)

Construction Ambient Air Quality Analysis

Valley Air District Rule 2201 requires that an Ambient Air Quality Analysis (AAQA) be conducted for a project when that project's maximum daily emissions exceed 100 pounds for any single criteria or precursor pollutant after incorporation of all mitigation.

Mitigated project construction emissions are presented in Table 3.3-9. It should be noted that if project construction moves to later years, resulting emissions are anticipated to reduce because equipment efficiency and fuel content standards generally improve with each year and construction fleet operators periodically replace old equipment with new, more efficent equipment.

It should also be noted, however, that while the construction schedule anticipated for the proposed project assumes that none of the three project phases would overlap, the potential remains for project phases to be constructed concurrently. Therefore, for purposes of a conservative analysis, Table 3.3-9 contains a secondary analysis to illustrate the potential emissions generated during the concurrent construction of all three project phases, representing a reasonable worst-case scenario.

As shown in Table 3.3-9, after the incorporation of MMs AIR-1a and AIR-1b, construction of the proposed project would not exceed the Valley Air District's daily emission screening levels for an AAQA, pursuant to District Rule 2201, assuming that none of the project phases were to be constructed concurrently.

However, as demonstrated in Table 3.3-9, emissions of ROG and CO would exceed the Valley Air District's significance thresholds after implementation of identified mitigation if all three project phases were constructed concurrently. As such, this impact would remain significant and unavoidable after implementation of identified mitigation.

Table 3.3-9: Mitigated Daily Construction Emissions (Sequential and Concurrent Phasing)

Year	Emissions (Pounds)

Daily maximum emissions are drawn from the maximum values between the Winter and Summer construction model results. Totals may not add up due to rounding. CalEEMod Output files are contained in Appendix B.

Operational Emissions

Operation of the proposed project at full buildout would involve the operation of light industrial, warehouse and distribution and relates uses on the project site. As shown in Chapter 2, Project Description, Table 2-2, Proposed Development Summary, the applicant for the Tracy Alliance parcels (Phase I) would develop approximately 1,849,500 square feet of warehouse uses and ancillary office space and related improvements. The applicant for the Suvik Farms parcels (Phase 2) would develop an estimated 1,023,660 square feet of light industrial uses and related improvements. The applicant for the Zuriakat parcel (Phase 3) would develop an estimated 479,160 square feet of light industrial uses and related improvements. Specific development plans for Phase 2 (Suvik Farms parcels) and Phase 3 (Zuriakat parcel) are not specified at this time. For the purposes of this analysis, buildout of these parcels was estimated at the maximum allowable density per acre identified in the Northeast Industrial Specific Plan.

Kimley-Horn and Associates produced a Transportation Impact Analysis (TIA) for the proposed project that analyzes the trip generation rates for the proposed project. As contained therein and shown in Table 3.3-10, Phase I (Tracy Alliance parcels) would generate an estimated 1,775 daily passenger vehicle trips and 836 daily truck trips; Phase 2 (Suvik Farms parcels) would generate an

estimated 974 daily passenger vehicle trips and 459 daily truck trips; and Phase 3 (Zuriakat parcel) would generate an estimated 456 daily passenger vehicle trips and 215 daily truck trips.

Table 3.3-10: Operational Vehicle Trips

Source	Daily Vehicle Trips
Project Phase 1	
Passenger Vehicles	1,775
Heavy-Duty Trucks	836
Total Phase 1 Vehicle Trips	**2,611**

Total Phase 3 Vehicle Trips	**671**
Notes: Fleet mix adjustment calculations can be found in Appendix B. Source: Kimley-Horn and Associates, Inc. 2021. Tracy Alliance and Northeast Area Annexation Transportation Impact Analysis – Draft. February.	

As discussed in Chapter 2, Project Description, the proposed project would involve the removal of existing structures, including two residences and nine agricultural outbuildings for equipment storage and maintenance. In order to demonstrate the net increase in emissions generated by the proposed project during operation beyond what is currently generated by existing land uses, the existing land uses were modeled. Table 3.3-11 displays the annual operational emissions that the existing land uses are anticipated to generate.

Table 3.3-11: Existing Annual Operational Emissions

As shown in Table 3.3-12, unmitigated operational emissions would exceed Valley Air District thresholds of significance for ROG and NO_X. Therefore, MMs AIR-1c and AIR-1d would be required to mitigate operational emissions to below Valley Air District thresholds.

$PM_{2.5}$ = particulate matter with aerodynamic diameter less than 10 microns
ROG = reactive organic gases
SO_X = oxides of sulfur

Incorporation of MM AIR-1d in operation of the proposed project would reduce annual NO_X emissions. As detailed more fully above, MM AIR-1d would require all phases of the proposed project to use a "clean truck fleet" that meets a performance standard of 0.02 gram of NO_X per brake horsepower-hour for all heavy-heavy-duty (HHD) trucks during project operation. In addition, as detailed more fully above, MM AIR-1c would require the use of consumer products that contain zero VOCs during operation of the proposed project. "Consumer products," as referred to in this mitigation measure, would include detergents, cleaning compounds, polishes, and floor finishes. "Consumer products," as referred to in this mitigation measure, would not include parking lot

degreasers, architectural coatings, and fertilizers. MM AIR-1d would require all phases of the proposed project to use a "clean truck fleet" that meets or exceeds a performance standard of 0.02 gram of NO_X per brake horsepower-hour for all HHD trucks during project operation.

It should be noted that, as detailed more fully above, MM AIR-1d, which would require the use of a HHD truck fleet that meets the 2013 Optional Low-NO_X Standard of 0.02 gram of NO_X per brake horsepower-hour, would represent an approximately 90 percent reduction in NO_X emissions from the current heavy-duty truck NO_X standard of 0.2 gram of NO_X per brake horsepower-hour.[18]

Nonetheless, the full implementation of MM AIR-1c and MM AIR-1d cannot be guaranteed during project operation; therefore, the emission estimates provided in Table 3.3-14 demonstrate a reasonable worst-case scenario for project operation after incorporation of identified mitigation. Because the operational emissions shown therein would exceed the Valley Air District's significnace thresholds for ROG and NO_X and this impact would remain significant and unavoidable.

Operational Ambient Air Quality Analysis

Valley Air District Rule 2201 requires that an AAQA be conducted for a project when that project's maximum daily emissions exceed 100 pounds for any single criteria or precursor pollutant after incorporation of all mitigation. As shown in Table 3.3-14, due to the uncertainty of full implementation of MM AIR-1c and MM AIR-1d, the potential emission reductions resulting from MM AIR-1c and MM AIR-1d are not considered in the proposed project's mitigated operational emissions. As such, maximum daily operational emissions generated by all phases of the proposed project would exceed the Valley Air District's screening threshold for an AAQA for NO_X emissions. As a result, this impact would remain significant and unavoidable after mitigation is incorporated.

Table 3.3-14: Mitigated Daily Operational Emissions

Impact Summary

Regional emissions generated by the proposed project would exceed applicable thresholds after compliance with all rules, regulations, and mitigation measures during operation. Localized operational emissions would also present a potentially significant impact after incorporation of identified mitigation. This impact would be significant and unavoidable.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Implement MMs AIR-1a to AIR-1d

Level of Significance After Mitigation

Significant and unavoidable impact.

Sensitive Receptors Exposure to Toxic Air Contaminant Concentrations

Impact AIR-3:	**The proposed project could expose sensitive receptors to substantial pollutant concentrations.**

Sensitive Receptors

Those who are sensitive to air pollution include children, the elderly, and persons with preexisting respiratory or cardiovascular illness. The Valley Air District considers a sensitive receptor to be a location that houses or attracts children, the elderly, people with illnesses, or others who are especially sensitive to the effects of air pollutants. Examples of sensitive receptors include hospitals, residences, convalescent facilities, and schools.

The closest sensitive receptors to the project site are single-family residences and Banta Elementary School. The closest sensitive receptors to the project site are located at the following distances:

- Residences as close as 145 feet west of the project site across Paradise Road;
- Residences immediately adjacent to the project site to the east along Grant Line Road;
- Residences as close as 120 feet south of the project site across Grant Line Road;
- Residences as close as 60 feet north of the project site across California Avenue; and
- Banta Elementary School approximately 1,500 feet to the east at its closest outside area.

It should be noted that while the above receptors represent the closest sensitive receptors to the proposed project, the Maximally Impacted Sensitive Receptor (MIR), as will be discussed under the "Construction: Toxic Air Contaminant" discussion below, during each construction phase of the proposed project may be different. The MIR during pollutant-generating activity is influenced by the distance of that receptor to the pollutant source(s), the amount and type of pollutants generated by each source, the topography and direction of the MIR as it relates to the pollutant source(s), and the prevailing meteorological conditions. Therefore, the closest sensitive receptor and the MIR may not be the same.

Construction

Construction: Reactive Organic Gas

ROG generated during construction activities are primarily emitted during the application of architectural coatings (painting). The amount emitted is dependent on the amount of ROG (or VOC) in the paint. ROG emissions are typically an indoor air quality health hazard concern rather than an outdoor air quality health hazard concern. In addition, construction of the proposed project would incorporate MM AIR-1b, which would require the use of "super-compliance" architectural coatings, reducing potential health impacts from ROG exposure. Therefore, exposure to ROGs during architectural coatings would be a less than significant health impact.

ROG generated during construction activities are also emitted during the pouring and curing of asphalt. Three types of asphalt are typically used in paving: asphalt cements, cutback asphalts, and emulsified asphalts. However, District Rule 4641 prohibits the use of the following types of asphalt: rapid cure cutback asphalt; medium cure cutback asphalt; slow cure asphalt that contains more than 0.5 percent of organic compounds that evaporate at 500 degrees Fahrenheit (°F) or lower; and emulsified asphalt containing organic compounds, in excess of 3 percent by volume, which evaporate at 500°F or lower. An exception to this is medium cure asphalt when the National Weather Service official forecast of the high temperature for the 24-hour period following application is below 50°F.

The acute (short-term) health effects from worker direct exposure to asphalt fumes include irritation of the eyes, nose, and throat. Other effects include respiratory tract symptoms and pulmonary function changes. The studies were based on occupational exposure of fumes. Residents are not in the immediate vicinity of the fumes because asphalt laying would principally occur within the interior of the project site and subsequent fumes would dissipate as they are emitted; therefore, they would not be subjected to concentrations high enough to evoke a negative response. In addition, the restrictions that are placed on asphalt in the San Joaquin Valley would serve to further reduce ROG emissions from asphalt and exposure. The impact to nearby sensitive receptors from ROG generation during construction would be less than significant.

Construction: NO_x, PM_{10}, $PM_{2.5}$, and CO

As discussed in Impact AIR-2, after incorporation of identified mitigation, emissions of CO generated during project construction have the potential to exceed the Valley Air District maximum daily emission AAQA screening threshold if all three project phases were constructed concurrently. Therefore, emissions during construction could exceed the significance thresholds (in the case of all three phases being constructed concurrently) even after incorporation of mitigation and could result in concentrations that would exceed ambient standards, contribute substantially to an existing exceedance of an ambient air quality standard, or expose sensitive receptors to substantial pollutant concentrations.

Construction: Toxic Air Contaminants

Construction of the proposed project would involve the use of diesel-fueled vehicles and equipment that emit DPM, which has been identified by the ARB as a TAC. The Valley Air District's latest threshold of significance for TAC emissions is an increase in cancer risk for the maximally exposed

individual of 20 in one million persons. Major sources of DPM include off-road construction equipment and heavy-duty delivery truck and worker activities. For purposes of this analysis, DPM is represented as exhaust emissions of PM_{10}.

Construction DPM emissions (PM_{10} exhaust) were estimated using CalEEMod, Version 2016.3.2, as presented under Impact AIR-2. On-site and off-site PM_{10} exhaust emissions utilized in the air dispersion modeling for this analysis are provided in Table 3.3-15. As presented in Table 3.3-6, the proposed project's construction is anticipated to occur from April 2022 through March 2025. Construction emissions were reasonably assumed to be distributed over the project site with a working schedule of 8 hours per day, 7 days per week. If all construction phases were to occur concurrently, construction emissions would consist of the combined emissions disclosed here; however, the exposure duration would be shorter than what was analyzed. Table 3.3-15 summarizes the mitigated emission rates of DPM during the construction of the proposed project, incorporating dust control measures required by District Rule 8021 and implementation of MM AIR-1a and MM AIR-1b. As illustrated in Table 3.3-16, unmitigated project construction would cancer risks experienced by nearby residents which exceed the Valley Air District's significance threshold of 20 cancer cases per 1 million people. As such, mitigation would be necessary to reduce impacts to nearby residents to less than significant levels.

Table 3.3-15: Unmitigated and Mitigated Construction DPM Emissions by Phase

Construction Scenario	On-Site DPM (as PM_{10} Exhaust)	Off-Site DPM[1] (as PM_{10} Exhaust)
Phase 1 (Tracy Alliance Parcels)		
Unmitigated Construction[2]	3.882E-02	4.830E-05
Mitigated Construction[2]	4.030E-03	4.830E-05
Phase 2 (Suvik Farms Parcels)		
Unmitigated Construction[2]	1.321E-02	1.995E-05
Mitigated Construction[2]	1.954E-04	1.995E-05
Phase 3 (Zuriakat Parcel)		
Unmitigated Construction[2]	2.299E-03	2.139E-06
Mitigated Construction[2]	4.986E-05	2.139E-06

Notes:
DPM = diesel particulate matter
PM_{10} = particulate matter with aerodynamic diameter less than 2.5 microns
[1] The off-site emissions were estimated over construction vehicle travel routes within two kilometers of the project site, or approximately 6,562 feet; see Appendix B for calculations.
[2] In scientific notation, the letter E is used to mean "10 to the power of."
Source: Appendix B; CalEEMod Output Files.

To assess impacts to off-site sensitive receptors, receptor locations within the American Meteorological Society/EPA Regulatory Model (AERMOD) model were placed at locations of existing

residences and the nearby school, all of which are located within a 2-kilometer radius of the project site boundary.

The Valley Air District has developed a set of guidelines for estimating cancer risks utilizing the Hot Spots Analysis and Reporting Program (HARP2), Version 19044, risk assessment stand-alone tool. Table 3.3-16 provides the estimated health and hazard impacts from unmitigated construction emissions at the MIRs for each construction phase and sensitive receptor age group using HARP2. The MIRs for Phase 1 construction were a single-family residence located approximately 1,025 feet east of the project site and Banta Elementary School approximately 2,495 feet east of the project site. The MIRs for Phase 2 construction were a single-family residence located approximately 35 feet east of the project site and Banta Elementary School approximately 1,500 feet east of the project site. The MIRs for Phase 3 construction were a single-family residence located approximately 550 feet southeast of the project site and Banta Elementary School approximately 2,150 feet southeast of the project site. As shown in Table 3.3-16, unmitigated construction emissions with sequential phasing would exceed the Valley Air District's cancer risk health threshold.

Table 3.3-16: Estimated Health Risks and Hazards—Unmitigated Construction (Sequential Phasing)

Risk Scenario	Annual Average PM_{10} Exhaust Concentration ($\mu g/m^3$)	Cancer Risk (Risk Per One Million)	Chronic Non-Cancer Hazard Index[1]
Phase 1 (Tracy Alliance Parcels)			
Residential MIR	5.775E-02	10.27	0.01
School MIR	2.239E-02	0.87	< 0.01
Phase 2 (Suvik Farms Parcels)			
Residential MIR	1.811E-01	32.20	0.04
School MIR	1.637E-02	0.64	< 0.01
Phase 3 (Zuriakat Parcel)			
Residential MIR	1.303E-02	2.32	< 0.01
School MIR	4.110E-03	0.16	< 0.01
Total Residential Risk		**44.79**	**0.05**
Total School Risk		**1.67**	**< 0.01**
Valley Air District Thresholds		**20**	**1**
Project Construction Exceeds Thresholds?		**Yes**	**No**

Notes:
$\mu g/m^3$ = micrograms per cubic meter
MIR = Maximally Impacted Sensitive Receptor
[1] Chronic non-cancer hazard index was estimated by dividing the annual DPM concentration (as PM_{10} exhaust) by the reference exposure level of 5 $\mu g/m^3$.
Source: California Office of Environmental Health Hazard Assessment (OEHHA). 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines. February. Website: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf.

The estimates shown in Table 3.3-17 include the application of measures required by District Rule 8021 and implementation of MMs AIR-1a and AIR-1b. As shown therein, the proposed project's construction DPM emissions would not exceed the Valley Air District's cancer risk or chronic non-cancer hazard index thresholds of significance at the maximum impacted receptor for any of the sensitive receptor age groups analyzed assuming that phases are constructed sequentially.

Nonetheless, the potential exists for all three project phases to be constructed concurrently, which would substantially increase the daily quantity of DPM emissions generated during project construction. As a result, the health risk impacts associated with project construction where phasing would be concurrent has the potential to generate DPM emissions resulting in cancer risks to nearby residents that exceed the Valley Air District's significance threshold of 20 cases per 1 million people even after incorporation of mitigation. As such, this impact would be significant and unavoidable after mitigation.

Table 3.3-17: Estimated Health Risks and Hazards—Mitigated Construction (Sequential Phasing)

Risk Scenario	Annual Average PM_{10} Exhaust Concentration ($\mu g/m^3$)	Cancer Risk (Risk Per One Million)	Chronic Non-Cancer Hazard Index[1]
Phase 1 (Tracy Alliance Parcels)			
Residential MIR	6.100E-03	1.08	<0.01
School MIR	2.460E-03	0.10	<0.01
Phase 2 (Suvik Farms Parcels)

Operation

Operation: Reactive Organic Gas

During operation, ROG would be emitted primarily from consumer products and motor vehicles. MM AIR-1c would require that the proposed project use zero-VOC consumer products during operation. While the full implementation of MM AIR-1c cannot be guaranteed, ROG emissions generated by the use of consumer products would be limited to the immediate area in which they are used on-site and would only occur during activities that use those products, such as facility cleaning activities. Therefore, nearby sensitive receptors would not be exposed to substantial ROG concentrations during project operations.

Direct exposure to ROG from motor vehicles would not result in health effects because the ROG emissions would be distributed across several miles of roadway and in the air. Therefore, the concentrations would not be great enough to result in direct health effects.

Operation: PM_{10}, $PM_{2.5}$, CO, and NO_X

As discussed in Impact AIR-2, after incorporation of identified mitigation, emissions of ROG and NO_X generated during project operation could exceed the Valley Air District annual thresholds of significance and maximum daily NO_X emissions could exceed the Valley Air District AAQA screening threshold. Therefore, emissions during operation of the proposed project could result in emission concentrations that exceed ambient standards, contribute substantially to an existing exceedance of an ambient air quality standard, or expose sensitive receptors to substantial pollutant concentrations.

Operation: Toxic Air Contaminants

Operation of the proposed project would involve the operation of heavy-duty, diesel-fueled vehicles that emit DPM, which has been identified by the ARB as a TAC. The Valley Air District's latest threshold of significance for TAC emissions is an increase in cancer risk for the maximally exposed individual of 20 in one million persons. Major sources of DPM during project operation include heavy-duty truck activities and worker vehicle trips. For purposes of this analysis, DPM is represented as exhaust emissions of PM_{10}.

Operational DPM emissions (PM_{10} exhaust) were estimated using CalEEMod, Version 2016.3.2, as described under Impact AIR-2. Operational emissions were assumed to be distributed over the project site with a working schedule of 24 hours per day, 7 days per week. Table 3.3-18 summarizes the mitigated emission rates of DPM during operation of the proposed project, incorporating measures required by District Rule 8021 and implementation of MM AIR-1c and MM AIR-1d.

Table 3.3-18: Mitigated Operational DPM Emissions (Phase 1 Only)

Construction Emissions	PM_{10} Exhaust (tons/year)
Mitigated Project Phase 1	
On-site[1]	1.412E-03
Off-site[2]	1.437E-04

Construction Emissions	PM_{10} Exhaust (tons/year)

Notes:
[1] Because of the off-model reductions applied to Phase 1 Mitigated Operational Emissions to demonstrate compliance with Mitigation Measure AIR-1d, which would require that all heavy-duty trucks utilized during operation of Phase I of the project meet the 2013 Optional Low-NO_x Standard of 0.02 gram of NO_x per brake horsepower-hour. This would represent a 90 percent reduction in NOx emissions from the current heavy-duty truck NOx standard of 0.2 gram of NOx per brake horsepower-hour. Because of the lack of available information related to reductions in the other criteria pollutants resulting from the application of Mitigation Measure AIR-1d, the mitigated PM_{10} exhaust emission estimates for operation of Phase I of the project do not reflect actual reductions to NO_x that would result from Mitigation Measure AIR-1d.
[2] The off-site emissions are adjusted to include only off-site emissions occurring along the local roadway network within a 2-kilometer radius of the project site.
Source: CalEEMod Output and Construction Health Risk Assessment Calculations; see Appendix B.

To assess impacts to off-site sensitive receptors, receptor locations within the AERMOD model were placed at locations of existing residences and the nearby school, all of which are located within a 2-kilometer radius of the project boundary. The MIRs for Phase 1 operation were a single-family residence located approximately 75 feet north of the project site, Banta Elementary School approximately 2,495 feet east of the project site, and on-site workers.

The Valley Air District has developed a set of guidelines for estimating cancer risks utilizing the Hot Spots Analysis and Reporting Program (HARP2), Version 19044, risk assessment stand-alone tool. Table 3.3-19 provides the estimated health and hazard impacts from operational emissions at the MIRs using HARP2.

Table 3.3-19: Estimated Health Risks and Hazards—Phase 1 Operation

Risk Scenario	Annual Average PM_{10} Exhaust Concentration ($\mu g/m^3$)	Cancer Risk (Risk Per One Million)	Chronic Non-Cancer Hazard Index[1]
Phase 1 (Tracy Alliance Parcels)			
Residential MIR	1.251E-02	13.13	< 0.01
School MIR	4.390E-03	1.13	< 0.01
Worker MIR	2.949E-02	2.92	0.01
Valley Air District Thresholds		**20**	**1**
Project Construction Exceeds Thresholds?		**No**	**No**

Risk Scenario	Annual Average PM_{10} Exhaust Concentration ($\mu g/m^3$)	Cancer Risk (Risk Per One Million)	Chronic Non-Cancer Hazard Index[1]

Notes:
$\mu g/m^3$ = micrograms per cubic meter
MIR = Maximally Impacted Sensitive Receptor
[1] Chronic non-cancer hazard index was estimated by dividing the annual DPM concentration (as PM_{10} exhaust) by the reference exposure level of 5 $\mu g/m^3$.
[2] Concentrations are taken from the air dispersion modeling results (Appendix B) and risk summary values are taken from HARP2 cancer risk calculation results (Appendix B).
[3] MM AIR-1c applies only to the generation of ROG and would not affect the generation of PM_{10} exhaust emissions.
[4] Phase 1 Mitigated Operational Emissions would be required to comply with Mitigation Measure AIR-1d, which would require that all heavy-duty trucks utilized during operation of Phase I of the project meet the 2013 Optional Low-NO_x Standard of 0.02 gram of NO_x per brake horsepower-hour. This would represent a 90 percent reduction in NO_x emissions from the current heavy-duty truck NO_x standard of 0.2 gram of NO_x per brake horsepower-hour. Because of the lack of available information related to reductions in the other criteria pollutants resulting from the application of Mitigation Measure AIR-1d, the mitigated PM_{10} exhaust emission estimates for operation of Phase I of the project do not reflect actual emission reductions that would result from Mitigation Measure AIR-1d.
Source: California Office of Environmental Health Hazard Assessment (OEHHA). 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines. February. Website: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf.

As shown above in Table 3.3-19, the proposed project's operational DPM emissions during Phase I would not exceed the Valley Air District's cancer risk or chronic non-cancer hazard index thresholds of significance at the maximum impacted receptor for any of the sensitive receptors analyzed. As displayed in Chapter 2, Project Description, Table 2-2, Proposed Development Summary, Phase I of the proposed project would involve the development of approximately 1,849,500 square feet out of a total approximately 3,352,320 square feet across all three project phases, representing approximately 46 percent of the total proposed building space. In addition, as displayed in Table 3.3-10, Phase 1 of the proposed project would generate an estimated 2,611 daily vehicle trips out of the total 4,715 daily trips across all three project phases, representing approximately 55 percent of the total proposed operational vehicle activity. Moreover, the potential emission reductions to DPM from the application of MM AIR-1d, which would require the operation of a clean truck fleet during operation of all phases of the proposed project, was not represented in the cancer risk values during Phase I operation in Table 3.3-19. Because of a lack in operational information for Phases 2 and 3 of the proposed project, such as freight product origin, local truck circulation, or other details necessary to preform a site-specific health risk assessment, Phase 1 of the proposed project was the only project phase modeled for health risk and chronic non-cancer hazard impacts. As Phase 1 represents approximately 55 percent of the potential operational trucking impact, although operation of Phase 1 (Tracy Alliance) would not result in a significant impact in this regard, operation at full buildout of the proposed project could have a potentially significant health impact on nearby sensitive receptors, particularly the residential MIRs.

The implementation of MM AIR-1d would contribute to the minimization of DPM emissions generated from trucking emissions; however, full implementation of MM AIR-1d cannot be guaranteed. As a result, this impact would be significant and unavoidable after the incorporation of mitigation.

Level of Significance Before Mitigation

Potentially Significant Impact

Mitigation Measures

MM AIR-1d.

Level of Significance After Mitigation

Significant and Unavoidable Impact

Valley Fever

Valley Fever, or coccidioidomycosis, is an infection caused by inhalation of the spores of the fungus, *Coccidioides immitis (C. immitis*). The spores live in soil and can live for an extended time in harsh environmental conditions. Activities or conditions that increase the amount of fugitive dust contribute to greater exposure, and they include dust storms, grading, and recreational off-road activities.

The San Joaquin Valley is considered an endemic area for Valley Fever. By geographic region, hospitalizations for Valley Fever in the San Joaquin Valley increased from 230 (6.9 per 100,000 population) in 2000 to 701 (17.7 per 100,000 population) in 2007. Within the region, Kern County reported the highest hospitalization rates, increasing from 121 (18.2 per 100,000 population) in 2000 to 285 (34.9 per 100,000 population) in 2007, and peaking in 2005 at 353 hospitalizations (45.8 per 100,000 population). The Centers for Disease Control and Prevention indicates that 752 of the 8,657 persons (8.7 percent) hospitalized in California between 2000 and 2007 for Valley Fever died.[19]

The distribution of *C. immitis* within endemic areas is not uniform and growth sites are commonly small (a few tens of meters) and widely scattered. Known sites appear to have some ecological factors in common suggesting that certain physical, chemical, and biological conditions are more favorable for *C. immitis* growth. Avoidance, when feasible, of sites favorable for the occurrence of *C. immitis* is a prudent risk management strategy. Listed below are ecologic factors and sites favorable for the occurrence of *C. immitis*:[20]

1. Rodent burrows (often a favorable site for *C. immitis*, perhaps because temperatures are more moderate and humidity higher than on the ground surface).
2. Prehistoric Indian campsites near fire pits.
3. Areas with sparse vegetation and alkaline soils.
4. Areas with high salinity soils.
5. Areas adjacent to arroyos (where residual moisture may be available).

[19] The Centers for Disease Control and Prevent (CDC). 2009. Increase in Coccidioidomycosis – California, 2000-2007. February 13. Website: https://www.cdc.gov/mmwr/preview/mmwrhtml/mm5805a1.htm#:~:text=In%20California%2C%20coccidioidomycosis%20cases%20requiring,in%202007%20(Figure%201). Accessed February 18, 2021.

[20] United States Geological Survey (USGS). 2000. Operational Guidelines (Version 1.0) for Geological Fieldwork in Areas Endemic for Coccidioidomycosis (Valley Fever). Website: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.486.1526&rep=rep1&type=pdf. Accessed March 1, 2021.

6. Packrat middens.
7. Upper 30 centimeters of the soil horizon, especially in virgin undisturbed soils.
8. Sandy well aerated soil with relatively high-water holding capacities.

Sites within endemic areas less favorable for the occurrence of *C. immitis* include:

1. Cultivated fields
2. Heavily vegetated areas (e.g., grassy lawns)
3. Higher elevations (above 7,000 feet)
4. Areas where commercial fertilizers (e.g., ammonium sulfate) have been applied
5. Areas that are continually wet
6. Paved (asphalt or concrete) or oiled areas
7. Soils containing abundant microorganisms
8. Heavily urbanized areas where there is little undisturbed virgin soil

The project site is relatively undeveloped and is surround by undeveloped, agricultural, industrial, and residential land uses which are semi-rural to urban in character. Because the majority of the project site and the immediately surrounding vicinity consists of urbanized development or cultivated fields, the project site is an area that would lead to a low probability of having *C. immitis* growth sites and exposure from disturbed soil.

Construction activities would generate fugitive dust that could contain *C. immitis* spores. The proposed project would be required to minimize the generation of fugitive dust during construction activities by complying with District Rule 8021. Therefore, this regulation would ensure that Valley Fever impacts during construction are less than significant.

During operations, dust emissions are anticipated to be negligible, because the site for each project phase would be occupied by buildings, pavement, and landscaped areas after construction is complete for that project phase. Therefore, project operations would not occur on undeveloped sites and dust emissions typically associated with activity on unpaved surfaces would be negligible. This condition would preclude the possibility of the proposed project from generating significant fugitive dust that may contribute to Valley Fever exposure. Impacts would be less than significant.

Asbestos and Lead-Based Paint Exposure

According to a map of areas where naturally occurring asbestos in California are likely to occur, there are no such areas in the project area.[21] Therefore, development of the proposed project is not anticipated to expose receptors to naturally occurring asbestos. Moreover, the proposed project would include the demolition of two single-family homes and various agricultural buildings on-site. As a result, the demolition of the existing structures could potentially expose workers and nearby receptors to asbestos-containing material, such as insulation, or lead-based paint. Nonetheless, the proposed project would be subject to California Code of Regulations, Section 66261.24; Title 8,

[21] United States Geological Survey (USGS). 2011. Reported Historic Asbestos Mines, Historic Asbestos Prospects, and Other Natural Occurrences of Asbestos in California. Website: https://pubs.usgs.gov/of/2011/1188/. Accessed February 18, 2021.

California Code of Regulations, Section 1532.1; and Title 40, Code of Federal Regulations, Part 745, which are intended to limit hazardous material emissions, including asbestos and lead, from demolition or renovation of structures and the associated disturbance of waste material generated or handled during these activities. The rule addresses the national emissions standards for asbestos and lead along with some additional requirements. Therefore, projects that comply with these regulations would ensure that hazardous demolition materials, such as asbestos or lead-based paint, would be removed and disposed of appropriately and safely. By complying with these existing regulations, thereby minimizing the potential release of airborne asbestos or lead emissions, proposed demolition activity would not result in a significant impact to air quality. This impact would be less than significant.

Level of Significance Before Mitigation

Less Than Significant Impact

Mitigation Measures

None

Objectionable Odors Exposure

Impact AIR-4: **The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.**

Odor impacts on residential areas and other sensitive receptors, such as hospitals, day-care centers, schools, etc. warrant the closest scrutiny, but consideration should also be given to other land uses where people may congregate, such as recreational facilities, worksites, and commercial areas.

Two situations create a potential for odor impact. The first occurs when a new odor source is located near an existing sensitive receptor. The second occurs when a new sensitive receptor locates near an existing source of odor. Impacts to new receptors is generally outside the scope of CEQA review but is included in this analysis for informational purposes only. The Valley Air District has determined the common land use types that are known to produce odors in the Air Basin and their associated screening distances when determining potentially significant odor impacts. These types and screening distances are shown in Table 3.3-20.

Table 3.3-20: Screening Levels for Potential Odor Sources

Odor Generator	Distance
Wastewater Treatment Facilities	2 miles
Sanitary Landfill	1 mile
Transfer Station	1 mile
Composting Facility	1 mile
Petroleum Refinery	2 miles
Asphalt Batch Plant	1 mile
Chemical Manufacturing	1 mile

Odor Generator	Distance
Fiberglass Manufacturing	1 mile
Painting/Coating Operations (e.g., auto body shop)	1 mile
Food Processing Facility	1 mile
Feed Lot/Dairy	1 mile
Rendering Plant	1 mile
Source: San Joaquin Valley Air Pollution Control District (Valley Air District). 2015. Final Draft Guidance for Assessing and Mitigating Air Quality Impacts. February 19. Website: http://www.valleyair.org/transportation/GAMAQI-2015/FINAL-DRAFT-GAMAQI.PDF/ Accessed February 16, 2021.	

According to the Valley Air District GAMAQI, analysis of potential odor impacts should be conducted for the following two situations:

- **Generators:** projects that would potentially generate odorous emissions proposed to locate near existing sensitive receptors or other land uses where people may congregate, and
- **Receivers:** residential or other sensitive receptor projects or other projects built for the intent of attracting people locating near existing odor sources.

Project Analysis

Land uses that are typically identified as sources of objectionable odors include landfills, transfer stations, sewage treatment plants, wastewater pump stations, composting facilities, feed lots, coffee roasters, asphalt batch plants, and rendering plants. The proposed project would not involve any of these or similar activities. Therefore, the proposed project would not be considered to have the potential to expose nearby persons to substantial sources of objectionable odors.

During construction, the various diesel-powered vehicles and equipment in use on-site would create localized odors. The proposed project would develop approximately 191 acres, which would require the operation of construction equipment and vehicles throughout the project site. However, as the proposed buildings would be located within the interior of the project site and set back from the project boundaries and surrounding land uses, the operation of construction equipment and vehicles would predominantly occur in the interior of the project site and not along the project boundaries. As such, these odors would be temporary and would not likely be noticeable for extended periods of time beyond the project's site boundaries. The potential for diesel odor impacts is therefore less than significant.

As an industrial development project, the proposed project would not constitute the development of residences, schools, hospitals, or other sensitive receptors and therefore does not have the potential to place sensitive receptors near existing odor sources. Therefore, the proposed project would neither constitute a land use which would generate odors affecting a substantial amount of people nor place new receptors that could be affected by existing odor sources.

Level of Significance

Less Than Significant Impact

3.3.5 - Cumulative Impacts

The geographic scope considered for cumulative impacts to air quality is the Air Basin. In developing mass emission thresholds of significance for criteria pollutants and ozone precursors, the Valley Air District considers the emission levels for which a project's individual emissions would be cumulatively considerable. Therefore, if a project would exceed the identified construction or operational significance thresholds, its emissions would be cumulatively considerable.

The Air Basin is in nonattainment for ozone, PM_{10}, and $PM_{2.5}$, which means that the background levels of those pollutants are at times higher than the ambient air quality standards and a cumulative air quality impact currently exists for the region. Therefore, if a project exceeds the Valley Air District significance thresholds for ozone precursor emissions or emissions of $PM_{2.5}$ or PM_{10}, that project would be considered to contribute to an existing cumulative air quality impact. As discussed in Impact AIR-2, MMs AIR-1a and AIR-1b would reduce the proposed project's potentially significant air quality impacts related to ozone precursor emissions during construction; however, as discussed in Impact AIR-2, project construction emissions for ozone precursors would remain potentially significant after implementation of identified mitigation should all three project phases be constructed concurrently.. In addition, because the full implementation of MMs AIR-1c and AIR-1d cannot be guaranteed during project operation, the proposed project could result in potentially significant impact related to regional emissions significance threshold for ROGs and NO_X, both ozone precursor pollutants, during project operation. Moreover, because full implementation of MMs AIR-1c and AIR-1d cannot be guaranteed, the proposed project could result in a potentially significant localized violation during operation.

As discussed in Impact AIR-2, District Rule 8021 would be required, which would further ensure that air quality impacts related to fugitive particulate matter during construction activities are less than significant. Nonetheless, after incorporation of identified mitigation and implementation of the required rules and regulations, the proposed project could result in construction and operational emissions which are greater than the respective Valley Air District significance thresholds and could therefore have a cumulatively considerable contribution to a cumulative impact. The proposed project would therefore result in significant and unavoidable cumulative air quality impacts.

With regard to impacts on sensitive receptors, the DPM emissions from construction of the proposed project could result in significant health impacts if all three project phases are constructed concurrently. Therefore, the proposed project's impact could be cumulatively considerable. In addition, the operational DPM emissions during Phase 1 of the proposed project would not result in significant health impacts. However, Phase 1 of the proposed project would constitute approximately 55 percent of anticipated trucking activity across the whole project. Therefore, the combined operation of the proposed project could result in exposing nearby sensitive receptors to substantial amounts of pollutants. Nonetheless, the cumulative impact associated with construction and operation of the proposed project would be cumulatively considerable.

Odor impacts that would be associated with the proposed project would principally be temporary in nature and limited to the combustion of diesel fuels during construction and operation. The impact would be less than significant during project construction and operation would be intermittent and spatially dispersed. As such, associated odors would dissipate quickly. In addition, no adverse cumulative condition related to odors to which the proposed project could contribute currently exists. Given the proximity of cumulative projects to the proposed project and the expected duration of sensitive receptor exposure to project-related diesel exhaust, the proposed project in combination with other cumulative projects would not cause a significant cumulative effect. Therefore, cumulative odor impacts would be less than significant.

The proposed project would result in a cumulatively considerable contribution to significant cumulative air quality and health impacts with respect to consistency with the applicable AQP (Impact AIR-1), cumulative criteria pollutant emissions during both construction and operation (Impact AIR-2), and impacts to sensitive receptors during both construction and operation (Impact AIR-3).

Level of Cumulative Significance Before Mitigation

Potentially significant impact with respect to consistency with the applicable AQP (Impact AIR-1), cumulative criteria pollutant emissions during both construction and operation (Impact AIR-2), and impacts to sensitive receptors during both construction and operation (Impact AIR-3).

Less than significant with respect to odor impacts (Impact AIR-4).

Mitigation Measures

Implement MMs AIR-1a to AIR-1d and MM AIR-3

Level of Cumulative Significance After Mitigation

Significant and unavoidable impact with respect to consistency with the applicable AQP (Impact AIR-1), cumulative criteria pollutant emissions during both construction and operation (Impact AIR-2), and impacts to sensitive receptors during both construction and operation (Impact AIR-3).

3.4 - Biological Resources

3.4.1 - Introduction

This section describes the existing biological resources conditions in the project site and vicinity,[1] as well as the relevant regulatory framework. This section also evaluates the potential impacts related to biological resources that could result from implementation of the proposed project and appropriate and feasible mitigation measures to reduce potential impacts to a less than significant level. Information in this section is based, in part, on-site reconnaissance surveys of the project site that included a Biological Resources Assessment (BRA). The BRA can be found in Appendix C.

The following comments were received during the Draft Environmental Impact Report (Draft EIR) scoping period related to Biological Resources:

- **Central Valley Regional Water Quality Control Board:** The commenter describes the various Regional Water Quality Control Board (RWQCB) regulations and policies that would need to be discussed in the Draft EIR and properly mitigated for. In addition, the commenter provides background information regarding the types of permits required for this project to comply with regulations meant to protect water quality.
- **San Joaquin Council of Governments:** The commenter states that the City of Tracy (City) is a signatory to San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) and that the project site would fall in the Planning Area. The commenter explains that participation in the SJMSCP satisfies requirements of both the State and federal Endangered Species Acts and ensures that the impacts are mitigated below a level of significance in compliance with the California Environmental Quality Act (CEQA). The commenter recommends that the co-applicants schedule an SJMSCP Biologist to perform a pre-construction survey prior to any ground disturbance. The commenter also explains that the proposed project would need to implement SJMSCP Incidental Take Minimization Measures (ITMMs) and mitigation requirements.

3.4.2 - Methods

Records Searches and Pedestrian Survey to Identify Existing Biological Resources

Literature Review

The literature review provides a baseline from which to evaluate the biological resources potentially occurring on the project site, as well as in the surrounding study area.

FirstCarbon Solutions (FCS) Biologists examined existing environmental documentation for the project site and immediate vicinity, an approximately 500-foot buffer where applicable. This documentation included the BRA noted above; relevant biological studies for the project site and its immediate vicinity; relevant literature pertaining to the habitat requirements of special-status species potentially occurring within of the project site; and federal and State register listings, protocols, and species data

[1] Off-site frontage improvements are limited in nature and are located within Rights of Way. Off-site traffic improvements have been contemplated as part of City's Traffic Management Plan and the associated environmental document.

provided by the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW).

Elevation and Drainage

FCS Biologists reviewed current United States Geological Survey (USGS) 7.5-minute topographic quadrangle map(s) and aerial photographs as a preliminary step in the analysis of the existing conditions within the project site and immediate vicinity. Information obtained from the review of the topographic maps included elevation range, general watershed information, and potential drainage feature locations.[2] Aerial photographs provide a perspective of the most current site conditions relative to on-site and off-site land use, plant community locations, and potential locations of wildlife movement corridors.

Soil

FCS Biologists also reviewed United States Department of Agriculture (USDA) soil surveys to establish if soil conditions in the project site are suitable for any special-status plant species.[3] These soil profiles include soil series with similar thickness, arrangement, and other important characteristics. The soil series consist of separate soil mapping units that provide specific information regarding soil characteristics. Many special-status plant species have a limited distribution based exclusively on soil type. Therefore, pertinent USDA soil survey maps were reviewed to determine the existing soil mapping units within the project site and to establish if soil conditions are suitable for any special-status plant species.

Special-status Wildlife and Plant Species

FCS Biologists compiled a list of threatened, endangered, and otherwise special-status species previously recorded on the project site and within the general project site vicinity. The list was based on a search of the CDFW California Natural Diversity Database (CNDDB),[4] a special-status species and plant community account database, and the California Native Plant Society (CNPS) Electronic Inventory (CNPSEI) of Rare and Endangered Vascular Plants of California database[5] for the *Tracy, California* USGS 7.5-minute Topographic Quadrangle Map. The database search results can be found in Appendix C. The CNDDB Biogeographic Information and Observation System (BIOS) database[6] was used to determine the distance between known recorded occurrences of special-status species and the project site.

Trees

The City of Tracy Municipal Code, Chapter 7.08 pertains to the alteration or removal of street trees, which are not present on the project site. The City does not have an adopted Tree Protection Ordinance relating to alteration or removal of trees on private property.

Jurisdictional Waters and Wetlands

FCS Biologists reviewed USGS topographic maps and aerial photography to identify any potential natural drainage features and water bodies. In general, all surface drainage features identified as blue-line streams on USGS maps and linear patches of vegetation are expected to exhibit evidence of flows and considered potentially subject to State and federal regulatory authority as "waters of the United States and/or State." A preliminary assessment was conducted to determine the location of any existing drainages and limits of project-related grading activities, to aid in determining whether a formal delineation of waters of the United States or State is necessary.

Field Survey

The reconnaissance-level field survey was conducted by FCS Biologists, Bernhard Warzecha and Robert Carroll, on April 7, 2020, from 11:45 a.m. to 2:45 p.m. Weather conditions during the field survey were partly cloudy with a high temperature of 65°F (degrees Fahrenheit).

The objective of the survey was to ascertain existing site conditions and identify potentially suitable habitat areas for various special-status plant and wildlife species. Special-status or unusual biological resources identified during the literature review were ground-truthed during the reconnaissance-level survey. Special attention was paid to sensitive habitats and areas potentially supporting special-status floral and faunal species.

3.4.3 - Environmental Setting

Physical Habitat/Vegetation

Habitat is an area consisting of a combination of resources (e.g., food, cover, water) and environmental conditions (e.g., temperature, precipitation, and presence or absence of predators and competitors) that promotes occupancy by individuals of a species and enables those individuals to survive and reproduce. Thus, habitat arises from interaction among soils, hydrology, climate, vegetation, and others. Soils, hydrology, and climate are addressed in other sections of this Draft EIR; this habitat discussion includes information regarding vegetation.

City of Tracy

The City of Tracy General Plan Planning Area currently contains a range of vegetation and habitat types including urban, agricultural, riparian woodlands, seasonal wetlands, farmed wetlands, and non-native grasslands. These vegetation areas and habitats, which are described below, host a wide range of wildlife and plant species that reflect the diversity in San Joaquin County and the Central Valley.[7] The Planning Area is included within the General Plan as a signal to the County and other nearby local and regional authorities that the City recognizes that planning and development within this area has an impact on the future of the City. Under State law, the City is invited to comment on development within the Planning Area that is subject to review by the County as the Lead Agency. The Planning Area contains approximately 114 square miles and is 92 square miles larger than the city limits and 72 square miles larger than the proposed Sphere of Influence (SOI).[8] Figure 1-2 of the

[7] Design, Community, and Environment. 2011. City of Tracy General Plan (prepared for the City of Tracy). Website: https://www.ci.tracy.ca.us/documents/2011_General_Plan.pdf. Accessed: January 18, 2021.

[8] Ibid.

City's General Plan delineates the city limits, Planning Area, and SOI. The project site is located within the City's SOI, but not within the City municipal boundaries.

Agricultural

Much of the land outside of the Tracy city limits is used for agricultural production. This area includes land that is currently in agricultural use and lands that have been used for agricultural uses in the past and remain non-urbanized.

Urban

The Urban land use type applies to the built-up portions of Tracy. Much of the land in the city limits and portion of the lands in the City's SOI are considered Urban.

Non-native Grasslands

The majority of non-native grasslands within Tracy and its SOI in the General Plan Planning Area occur within the southern portion of the City.

Riparian Woodland

The Great Valley Riparian Woodland communities lie in the northern portion of the City and its SOI, along the Old River and Tom Paine Slough riparian zones, and in the southern portion of the City and its SOI, along the Corral Hollow system, which flows northeast.

Seasonal Wetlands

There are numerous seasonal wetlands throughout the City and its SOI.

Farmed Wetlands

Wetland areas that are currently in agricultural uses are defined as farmed wetlands. This type of area occurs in the northern portion of the City and its SOI.

Project Site

The project site is almost entirely comprised of active agricultural fields consisting of alfalfa, almond tree orchards, and hay; associated agricultural and a few rural residential structures and irrigation/drainage channels are interspersed throughout the project site. Additionally, a ruderal/disturbed area is located within the southwestern corner of the project site along Grant Road Line which shows evidence of previous development. A comprehensive list of plant species observed during the April 2020 site visit can be found in Appendix C.

Agricultural

Based on preliminary mapping, the project site potentially includes approximately 188 acres of active agricultural fields. Alfalfa fields are located in the northern portion of the site, pecan (*Carya illinoinensis)* tree orchard is located in the eastern portion, a hay field is located in the southwestern portion, and irrigation/drainage channels spread throughout the agricultural fields along private dirt roads. The fields are routinely managed–including the applications of pesticides, herbicides, irrigation, and seasonal harvests–and disced regularly. Plant species observed within areas not subject to active agriculture (e.g., narrow strips along field borders and access roads) are dominated by common ruderal species and non-native annual grasses, including field bindweed (*Convolvulus*

arvensis), shortpod mustard (*Hirschfeldia incana*) black mustard (*Brassica nigra)*, soft chess (Bromus hordeaceous), ripgut brome (*Bromus diandrus*), seaside barley (*Hordeum marinum* ssp. *gussaneonum)*, wall barley (*Hordeum murinum)*, and others.

Ruderal/Disturbed

This small area of the project site consists of approximately 0.63 acre along Grant Line Road. Species observed in this area include ryegrass (Festuca perennis), Bermuda grass (Cynodon dactylon), and other non-native and ruderal plants. Ruderal/Disturbed land is classified as areas that have been physically disturbed (by previous legal human activity) and are no longer recognizable as a native or naturalized vegetation association but continues to retain a soil substrate. Typically, vegetation, if present, is nearly exclusively composed of non-native plant species such as ornamentals or ruderal exotic species that take advantage of disturbance, or that shows signs of past or present animal usage that removes any capability of providing viable natural habitat for uses other than dispersal. Examples of Ruderal/Disturbed land include areas that have been graded, repeatedly cleared for fuel management purposes and/or experienced repeated use that prevents natural revegetation (i.e., dirt parking lots, trails that have been present for several decades), recently graded firebreaks, graded construction pads, construction staging areas, off-road vehicle trails, and others.

Urban/Developed

This small area of the project site consists of approximately 4 acres at the intersection of Grant Line Road and Paradise Road. This area contains a combination of equipment storage sheds, active barns, parking, and a few rural residential structures. Urban/Developed land is classified as areas that have been constructed upon or otherwise physically altered to an extent that native vegetation is no longer supported and retains no soil substrate. Urban/Developed land is characterized by permanent or semi-permanent structures, pavement, or hardscape, and landscaped areas that often require irrigation. Areas where no natural land is evident because a large amount of debris or other materials have been placed upon it may also be considered Urban/Developed (e.g., car recycling plant, quarry).

Cattail Marsh

One occurrence of approximately 0.07 acre of cattail (*Typha* spp.) marsh was observed in the channel along California Ave, on the northern boundary of the project site, within the Zuriakat parcel. The majority of the cattails consist of broadleaf cattails (*Typha latifolia*). Most plants were senescent during the time of the survey; however, some live plants were also observed. This vegetation type is classified as a California Natural Community by the CDFW (Type 52.050.04–Typha [*latifolia, angustifolia])*.

Sensitive Biological Communities

Biological communities are assemblages of organisms that live within or use a variety of habitats for their range-of-life functions. Of the habitat communities discussed above, some are further identified as sensitive biological communities. For the purpose of this Draft EIR, sensitive biological communities are defined as habitats that fulfill special functions or have special values (e.g., greater biological diversity), such as wetlands, streams, and riparian habitat. Because wildlife is a major

aspect of a biological community, this discussion of sensitive biological communities describes wildlife present in such communities.

Sensitive Biological Communities on the Project Site

A small portion of the project site contains approximately 0.07 acre of cattail marsh in the channel along California Avenue, on the northern boundary of the project site, within the Zuriakat parcel. The majority of the cattails consisted of broadleaf cattails. This vegetation type is classified as a California Natural Community by the CDFW (Type 52.050.04–Typha [*latifolia, angustifolia]*). This natural community is discussed in further detail in Impact BIO-3 below.

Wetlands and Waters of the United States and the State

Wetlands and waters of the United States and waters of the State are protected as aquatic resources that provide habitat for common and special-status species. Types of aquatic resource features include open water, developed open water, tidal marsh, seasonal wetland, wetlands swale, streams, creeks, and other waters.

City of Tracy

Wetlands, waters of the United States, and waters of the State in the City primarily occur in northern portion of the City along the Old River and Tom Paine Slough riparian zones, and in the southern portion of the City along the Corral Hollow system, which flows northeast. Additionally, there are numerous seasonal wetlands scattered through the City.[9]

Project Site

There are several irrigation/drainage channels throughout the project site, which appear to have a potential hydrological connection to the San Joaquin River, a traditional navigable water of the United States. The man-made channels on the project site have all been excavated within upland habitat for the purpose of on-site agricultural irrigation and drainage.

A small portion of the project site contains an approximately 0.07-acre cattail marsh in the channel along California Avenue, on the northern boundary of the project site, within the Zuriakat parcel. These features are discussed in further detail in Impact BIO-3 below.

Common Species

The vegetation community and land cover types discussed above provide habitat for numerous local wildlife species. The agricultural fields, including the almond orchard is likely to provide cover and foraging opportunities for urban-adapted mammals such as raccoon (*Procyon lotor)* and Virginia opossum (*Didelphis virginiana)*. California ground squirrel (*Otospermophilus beecheyi)* was observed only at the area of the project residential site where rural residential uses are located. No California ground squirrel or ground squirrel burrows were observed on or near the agricultural fields, orchard, or channel. One jack rabbit (*Lepus californicus*) was observed on the project site. While not

[9] Design, Community, and Environment. 2011. City of Tracy General Plan (prepared for the City of Tracy), pages, 6-3-6-5. Website: https://www.ci.tracy.ca.us/socuments/2011_General_Plan.pdf.Accessed: January 18, 2021.

physically observed during the field survey, FCS Biologists found numerous raccoon and great egret (*Ardea alba)* tracks throughout the project site.

Because of a lack of suitable habitat, it is unlikely that most amphibians and reptiles would regularly occur on the project site. Potential species occurring on the project site include western fence lizard (*Sceloporus occidentalis*), terrestrial garter snake (*Thamnophis elegans*), gopher snake (*Pituophis melanoleucus*), and Northern Pacific tree frog (*Pseudacris regilla)*. Northern Pacific tree frog was the only amphibian observed on the project site; no other amphibians or reptiles were observed during the field survey.

Ornamental trees within the Urban/Developed portion of the project site and within the greater project site vicinity (approximately 500 feet) also provide suitable habitat for nesting avian species. A comprehensive list of wildlife species observed during the April 2020 site visit can be found in Appendix C.

Special-status Species

Special-status species, whether plants, wildlife, or fish, are considered sufficiently rare that they require special consideration and/or protection and have been or should be listed as rare, threatened, or endangered by the federal and/or State governments. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under the California Endangered Species Act (CESA) or the federal Endangered Species Act.
- Protected under other regulations (e.g., Migratory Bird Treaty Act [MBTA]).
- CDFW Species of Special Concern.
- Plant species ranked by the CNPS; or
- Otherwise entitled to receive consideration during environmental review under CEQA pursuant to applicable laws and regulations.

The following discussion focuses on potential for occurrence of special-status species in the project site.

Special-status Plant Species Evaluated

Special-status plants and plant communities are considered sensitive biological resources when federal, State, or local laws regulate their development, limited distributions, and habitat requirements of special-status plant or wildlife species that occur within them.

The Special-status Plant Species Table (Appendix C, Table 1) identifies six special-status plant species and CNPS sensitive species that have been recorded to occur within the *Tracy*, *California* USGS 7.5-minute Topographic Quadrangle Map as recorded by the CNDDB and CNPSEI.[10,11] The table also

[10] California Department of Fish and Wildlife (CDFW). 2020. California Natural Diversity Database (CNDDB). Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed April 24, 2020.

[11] California Native Plant Society (CNPS). 2020. Rare and Endangered Plant Inventory. Website: http://rareplants.cnps.org/. Accessed April 24, 2020.

includes the species' status, required habitat, and potential to occur within the project site. All special-status plant species have been determined unlikely to occur on the project site, based on the absence of suitable habitat, lack of observations during FCS's field survey, and past and ongoing disturbance through agricultural activity.

Special-status Wildlife Species Evaluated

The Special-status Wildlife Species Table (Appendix C, Table 2) identifies seven federal and State listed threatened and/or endangered wildlife species, and 15 other special-status species that have been recorded in the CNDDB as occurring within the *Tracy*, *California* USGS 7.5-minute Topographic Quadrangle Map (Exhibit 3.4-2).[12] The table also includes species' status, required habitat, and potential to occur within the project site. Fourteen special-status wildlife species have been determined unlikely to occur on the project site, primarily based on the absence of suitable habitat and past and ongoing disturbance through agricultural activity.

Eight special-status wildlife species have at least some potential to occur on the project site and are therefore discussed in further detail below.

Mammals

San Joaquin Kit Fox

San Joaquin kit fox (*Vulpes macrotis mutica)* is listed under the Endangered Species Act as endangered and is listed under CESA as threatened. This species is also covered under the SJMSCP. This species is found in annual grasslands with scattered shrub vegetation and needs loose textured sandy soils for burrowing. The project site generally lacks suitable habitat for this species. San Joaquin kit fox has been sporadically reported from southern areas of Tracy, less than 4 miles from the project site.[13] While San Joaquin kit fox is unlikely to occur on the project site and no dens or other signs of San Joaquin kit fox were observed during the reconnaissance-level field survey, it cannot be ruled out that a stray or migrating San Joaquin kit fox may be found on the project site before or during construction.

Pallid Bat

Pallid bat (*Antrozous pallidus)* is a State Species of Special Concern. This species occurs commonly in low elevations throughout California and occupies a wide variety of habitats, including woodlands, grasslands, shrublands, and forests from sea level up to mixed conifer forests.[14] This species is most common in open, dry habitats with rocky areas, but may also be found in caves, crevices, hollow trees, and buildings for roosting. The project site generally lacks suitable habitat for this species and all recorded occurrences are over 5 miles from the project site. However, the barn and other structures located within the project site and trees within the immediate vicinity of the project site may provide marginal roosting habitat for this species.

Townsend's Big-Eared Bat

Townsend's big-eared bat (*Corynorhinus townsendii)* is a State Species of Special Concern and is covered under the SJMSCP. This species is found throughout California, but details regarding its

[12] California Department of Fish and Wildlife (CDFW). 2020. California Natural Diversity Database (CNDDB). Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed April 24, 2020.

[13] Ibid.

[14] Ibid.

distribution are not well known. This species is found in all but alpine and sub-alpine habitats. It is most common in mesic habitats where it gleans from trees or feeds along habitat edges. This species requires caves, tunnels, buildings, or other anthropogenic structures for roosting.[15] The project site generally lacks suitable habitat for this species and all recorded occurrences are over 5 miles from the project site. However, the barn and other structures located within the project site may provide marginal roosting habitat for this species.

Western Mastiff Bat

Western mastiff bat (*Eumops perotis californicus)* is a State Species of Special Concern and is covered under the SJMSCP. This species occurs in a wide variety of habitats from desert scrub to chaparral and oak woodland. This species is primarily a crevice dwelling species and roosts are often found under large slabs of granite, sandstone, or in columnar basalt. This species also roosts within the cracks in buildings.[16] The project site generally lacks suitable habitat for this species and all recorded occurrences are over 5 miles from the project site. However, the barn and other structures located within the project site and trees within the immediate vicinity of the project site may provide marginal roosting habitat for this species.

Birds

Song Sparrow

Song sparrow (*Melospiza melodia; "*Modesto" population) is a State Species of Special Concern. This species occurs in emergent freshwater marshes dominated by cattails as well as riparian willow thickets. Species also nest in riparian forests of Valley Oak with a sufficient understory of blackberry along vegetated irrigation canals and levees. Marginal nesting habitat is present within the cattail marsh located in the northern portion of the project site, within the Zuriakat parcel.

Tricolored Blackbird

Tricolored blackbird (*Agelaius tricolor)* has been listed as a Threatened species under CESA and is covered under the SJMSCP. Nesting colonies of this species are addressed in the SJMSCP. Tricolored blackbird nests have typically been reported within extensive cattail marshes, willow canopies, or blackberry or thistle thickets. The species' basic requirements for selecting breeding sites are open accessible water; a protected nesting substrate, including either flooded or thorny or spiny vegetation; and a suitable foraging space providing adequate insect prey within a mile or two of the nesting colony. Emergent vegetation within the cattail marsh represents potential nesting habitat, albeit marginal. No tricolored blackbirds, nests, or signs of previous nesting activity in the cattail marsh within the Zuriakat parcel on the project site were observed. However, it cannot be ruled out that tricolored blackbird nesting may occur in the cattail marsh within the Zuriakat parcel.

Burrowing Owl

Burrowing owl (*Athene cunicularia)* is a California Species of Special Concern, and impacts including loss of habitat for this species is also covered under the SJMSCP. This is species is often found in open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. It is considered a subterranean nester that is dependent upon burrowing mammals,

[15] California Department of Fish and Wildlife (CDFW). 2020. California Natural Diversity Database (CNDDB). Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed April 24, 2020.

[16] Elizabeth Pierson and William Rainey, Terrestrial Mammal Species of Special Concern in California, Bolster, B.C., Ed 1998.

most notably the California ground squirrel. During the field survey, two California ground squirrels were observed on the highly disturbed, developed and currently used residential area within the project site. No burrows or burrow complexes suitable for burrowing owl or signs of presence of burrowing owl were observed during the field survey; however, it cannot be ruled out that a burrowing owl may occupy the project site before or during construction.

Swainson's Hawk

Swainson's hawk (*Buteo swainsoni)* is listed as a Threatened species under CESA and is also covered under the SJMSCP. This species can be found in scattered trees, riparian areas, savannas, and scattered on lines of trees on agricultural lands. Swainson's hawk requires adjacent foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.

Suitable foraging habitat is present on the project site and suitable nesting habitat is present within the immediate vicinity of the project site. This species was observed during the field survey.

Migratory and Nesting Birds

Trees within the project site provide suitable nesting habitat for various avian species, including those protected under the MBTA. Some species protected under the MBTA that were observed during the field survey include Say's phoebe (*Sayornis saya*), mourning dove (*Zenaida macroura)*, and killdeer (*Charadrius vociferus)*.

Wildlife Movement Corridors

City of Tracy

Terrestrial habitat throughout the City and its SOI ranges from high to low quality and varies in accessibility and continuity for wildlife movement. Wetland and riparian habitats provide wildlife movement corridors for numerous fish and bird species. In addition, the Pacific Flyway (a major north–south flyway for migratory birds in America) encompasses the entire West Coast, and migrating bird species utilize the wetland and riparian habitats for foraging and nesting.

Project Site

FCS Biologists evaluated the project site for evidence of a wildlife movement corridor during the biological resources survey, and concluded that the project site is not part of or within a wildlife movement corridor. The project site is surrounded by industrial developments and is situated in a semi-urban landscape with high amounts of traffic from local industrial operations. Further, Interstate 205 (I-205) separates the project site from the closest wildlife corridor to the north, and I-5 and Business I-205 potentially preclude non-volant wildlife movement from the east and southeast.

Regulated Trees

The City of Tracy Municipal Code, Chapter 7.08, pertains to the alteration or removal of street trees, which are not present on the project site. The City does not have an adopted Tree Protection Ordinance relating to alteration or removal of trees on private property.

The site contains a pecan orchard and several ornamental trees, which were observed during the field survey.

3.4.4 - Regulatory Framework

Federal

Endangered Species Act

The USFWS has jurisdiction over species listed as threatened or endangered under the Endangered Species Act. Section 9 of the Endangered Species Act protects listed species from "take," which is broadly defined as actions taken to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." The Endangered Species Act protects threatened and endangered plants and animals and their critical habitat. Candidate species are those proposed for listing; these species are usually treated by resource agencies as if they were actually listed during the environmental review process. Procedures for addressing impacts to federally listed species follow two principal pathways, both of which require consultation with the USFWS, which administers the Endangered Species Act for all terrestrial species. The first pathway is the Section 10(a) incidental take permit, which applies to situations where a non-federal government entity must resolve potential adverse impacts to species protected under the Endangered Species Act. The second pathway is Section 7 consultation, which applies to projects directly undertaken by a federal agency or private projects requiring a federal permit or approval.

Migratory Bird Treaty Act

The MBTA implements international treaties between the United States and other nations devised to protect migratory birds, their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit.

All migratory birds and their nests listed in the MBTA are protected from take or disturbance under the MBTA (16 United States Code [USC] § 703, *et seq*.).

Clean Water Act

The United States Army Corp of Engineers (USACE) and the United States Environmental Protection Agency (EPA) regulate the discharge of dredged or fill material into waters of the United States, including wetlands, under Section 404 of the Clean Water Act (CWA). Waters of the United States include wetlands, lakes, and rivers, streams, and their tributaries. Wetlands that fall under the jurisdiction of the USACE (referred to as jurisdictional wetlands) are defined as areas "inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." Areas not considered jurisdictional waters include, for example, non-tidal drainage and irrigation ditches excavated on dry land; artificially irrigated or created bodies such as small ponds, lakes or swimming pools; and waterfilled depressions (33 Code of Federal Regulations [CFR] 328.3; 40 CFR 230.3).

The applicants for development on any project parcel must obtain a permit from the USACE for all discharges of fill material into waters of the United States, including jurisdictional wetlands, before proceeding with a proposed action. If wetlands are jurisdictional and could be filled as part of the

proposed project, the USACE may issue either an individual permit or a general permit. Individual permits are prepared on a project-specific basis for projects that are expected to have adverse effects on the aquatic environment. General permits are pre-authorized permits issued to cover similar activities that are expected to cause only minimal individual and cumulative adverse environmental effects.

As stated in Section 401 of the CWA, "any applicant for a federal permit for activities that involve a discharge to waters of the State, shall provide the federal permitting agency a certification from the State in which the discharge is proposed that states that the discharge will comply with the applicable provisions under the Federal Clean Water Act." Therefore, before the USACE will issue a Section 404 permit, applicants must obtain a Section 401 Water Quality Certification from the RWQCB.

State

California Endangered Species Act

The State of California enacted CESA in 1984. CESA pertains to State listed endangered and threatened species. CESA requires State agencies to consult with the CDFW when preparing CEQA documents to ensure that the lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code [FGC] § 2080). CESA directs agencies to consult with the CDFW on projects or actions that could affect listed species, directs the CDFW to determine whether jeopardy would occur, and allows the CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows the CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (FGC § 2081).

California Department of Fish and Game Code

Under CESA, the CDFW has the responsibility for maintaining a list of endangered and threatened species (FGC § 2070). Fish and Game Code Sections 2050 through 2098 outline the protection provided to California's rare, endangered, and threatened species. Fish and Game Code Section 2080 prohibits the taking of plants and animals listed under CESA. Fish and Game Code Section 2081 established an incidental take permit program for State listed species. The CDFW maintains a list of "candidate species," which it formally notices as being under review for addition to the list of endangered or threatened species.

In addition, the Native Plant Protection Act of 1977 (NPPA) (FGC § 1900, *et seq*.) prohibits the taking, possessing, or sale within the State of any plants with a State designation of Rare, Threatened, or Endangered (as defined by the CDFW). An exception to this prohibition in the NPPA allows landowners, under specified circumstances, to take listed plant species, provided that the owners first notify the CDFW and give the agency at least 10 days to come and retrieve (and presumably replant) the plants before they are plowed under or otherwise destroyed. Fish and Game Code Section 1913 exempts from "take" prohibition "the removal of endangered or rare native plants from a canal, lateral ditch, building site, or road, or other right of way." Project impacts to these species

are not considered significant unless the species are known to have a high potential to occur within the area of disturbance associated with construction of the proposed project.

The CDFW also maintains lists of "Species of Special Concern" that serve as species "watch lists." The CDFW has identified many Species of Special Concern. Species with this status have limited distribution or the extent of their habitats has been reduced substantially, such that their populations may be threatened. Thus, their populations are monitored, and they may receive special attention during environmental review. While they do not have statutory protection, they may be considered rare under CEQA and specific protection measures may be warranted.

Sensitive species that would qualify for listing but are not currently listed are afforded protection under CEQA. CEQA Guidelines Section 15065 (Mandatory Findings of Significance) requires that a substantial reduction in numbers of a rare or endangered species be considered a significant effect. CEQA Guidelines Section 15380 (Rare or Endangered Species) provides for the assessment of unlisted species as rare or endangered under CEQA if the species can be shown to meet the criteria for listing. Unlisted plant species on the CNPS List ranked 1A, 1B, and 2 would typically require evaluation under CEQA.

Fish and Game Code Sections 3500 to 5500 outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. The CDFW cannot issue permits or licenses that authorize the take of any fully protected species, except under certain circumstances such as scientific research, live capture, and relocation of such species pursuant to a permit for the protection of livestock.

Under Fish and Game Code Section 3503.5, it is unlawful to take, possess, or destroy any birds in the orders of *Falconiformes* or *Strigiformes* (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto. To comply with the requirements of CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any State listed endangered or threatened species may be present in the project study area and determine whether the proposed project would have a potentially significant impact on such species. In addition, the CDFW encourages informal consultation on any proposed project that may impact a candidate species.

Amending protections granted to non-game migratory birds in Fish and Game Code Sections 3513, the California Migratory Bird Protection Act makes unlawful the taking or possession of any migratory non-game bird designated in the federal MBTA before January 1, 2017, any additional migratory non-game bird that may be designated in the federal act after that date, or any part of those migratory non-game birds, except as provided by rules and regulations adopted by the United States Secretary of the Interior under the federal act before January 1, 2017, or subsequent rules or regulations adopted pursuant to the federal act, unless those rules or regulations are inconsistent with the Fish and Game Code.

Project-related impacts to species on the CESA endangered or threatened list would be considered significant. State listed species are fully protected under the mandates of CESA. "Take" of protected

species incidental to otherwise lawful management activities may be authorized under Fish and Game Code Section 206.591. Authorization from the CDFW would be in the form of an Incidental Take Permit.

Fish and Game Code Section 1602 requires any entity to notify the CDFW before beginning any activity that "may substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" or "deposit debris, waste, or other materials that could pass into any river, stream, or lake." "River, stream, or lake" includes waters that are episodic and perennial, and ephemeral streams, desert washes, and watercourses with a subsurface flow. A Lake or Streambed Alteration Agreement would be required if the CDFW determines that project activities may substantially adversely affect fish or wildlife resources through alterations to a covered body of water.

California Department of Fish and Wildlife Species of Concern

In addition to formal listing under the Endangered Species Act and CESA, certain species receive additional consideration by the CDFW and local lead agencies during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern," developed by the CDFW. It tracks species in California whose numbers, reproductive success, or habitat may be threatened. In addition to Species of Special Concern, the CDFW identifies animals that are tracked by the CNDDB, but warrant no federal interest and no legal protection. These species are identified as California Special Animals.

California Native Plant Society

The CNPS maintains a rank of plant species that are native to California and that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. The following identifies the definitions of the CNPS ranks:

- **Rank 1A**: Plants presumed extirpated in California and either rare or extinct elsewhere
- **Rank 1B:** Plants Rare, Threatened, or Endangered in California and elsewhere
- **Rank 2A:** Plants presumed extirpated in California but common elsewhere
- **Rank 2B:** Plants rare, threatened, or endangered in California but more common elsewhere
- **Rank 3:** Plants about which more information is needed
- **Rank 4:** Watch List: Plants of limited distribution

All plants appearing on CNPS List 1 or 2 are considered to meet the CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA.

Porter-Cologne Water Quality Control Act

The RWQCB regulates actions that would involve "discharging waste, or proposing to discharge waste, within any region that could affect the water of the State" (Water Code § 13260(a)), pursuant to provisions of the Porter-Cologne Water Quality Act. "Waters of the State" are defined as "any

surface water or groundwater, including saline waters, within the boundaries of the State" (Water Code § 13050(e)).

California Code of Regulations (Wetlands and Waters Definition)

In accordance with the Porter-Cologne Water Quality Control Act (Water Code, § 13000 *et seq*.), the California State Water Resources Control Board (State Water Board) and the RWQCB are authorized to regulate discharges of waste, which includes discharges of dredged or fill material that may affect the quality of waters of the State. As described below, waters of the State include some, but not all, features that are defined as wetlands, as well as other features, including the ocean, lakes, and rivers. The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State[17] defines a wetland as follows: An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

Under California State law, waters of the State means "any surface water or groundwater, including saline waters, within the boundaries of the State." As such, water quality laws apply to both surface water and groundwater. After the United States Supreme Court decision in *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers* (531 USC 159), the Office of Chief Counsel of the State Water Board released a legal memorandum confirming the State's jurisdiction over isolated wetlands. The memorandum stated that under the California Porter-Cologne Water Quality Control Act, discharges to wetlands and other waters of the State are subject to State regulation, and this includes isolated wetlands. In general, the State Water Board regulates discharges to isolated waters in much the same way as it does for waters of the United States, using Porter-Cologne rather than CWA authority.

The CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq*. of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify the CDFW if a project or plan will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601." Additionally, the CDFW may assert jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over 4 inches diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, the CDFW may propose reasonable measures that will allow protection of those resources. If the applicant agrees to these measures, the applicant may enter into an agreement with the CDFW identifying the covered activities, impacts to the CDFW jurisdictional features, and compensatory mitigation.

Website: https://www.waterboards.ca.gov/board_info/agendas/2019/apr/040219_10_staff_rpt_comparison_to_january_2019_032219version.pdf. Accessed January 19, 2021.

Local

San Joaquin County Multi-Species Habitat Conservation and Open Space Plan

The SJMSCP was adopted in 2000 to provide a strategy for balancing the need to conserve Open Space and the need to convert Open Space to non-Open Space uses while protecting the region's agricultural economy; preserving landowner property rights; providing for the long-term management of plant, fish and wildlife species, especially those that are currently listed, or may be listed in the future, under the Endangered Species Act or CESA; providing and maintaining multiple-use Open Spaces that contribute to the quality of life of the residents of San Joaquin County; and accommodating a growing population while minimizing costs to project applicants and society at large. The SJMSCP is administered by the San Joaquin Council of Governments (SJCOG). The SJMSCP, in accordance with Endangered Species Act Section 10(a)(1)(B) and CESA Section 2081(b) Incidental Take Permits, provides compensation for the Conversion of Open Space to non-Open Space uses which affect the plant, fish and wildlife species covered by the SJMSCP. The SJMSCP compensates for Conversions of Open Space for the following activities: urban development, mining, expansion of existing urban boundaries, nonagricultural activities occurring outside of urban boundaries, levee maintenance undertaken by the San Joaquin Area Flood Control Agency, transportation projects, school expansions, non-federal flood control projects, new parks and trails, maintenance of existing facilities for non-federal irrigation district projects, utility installation, maintenance activities, managing Preserves, and similar public agency projects.

This Draft EIR is intended to provide the information needed to evaluate the proposed project's compliance with the SJMSCP to make the SJCOG Biologist's review as efficient as possible. The project site is located within the Central Zone; Category C, Agriculture Habitat Open Spaces; Pay Zone B (Agricultural) of the SJMSCP. Adoption and implementation of the SJMSCP is intended to provide full compensation and mitigation for potential environmental impacts to plants, fish and wildlife and demonstrate compliance pursuant to the State and federal laws such as CEQA, the National Environmental Policy Act (NEPA), Planning and Zoning Law, the State Subdivision Map Act, the Porter-Cologne Act, and the Cortese-Knox Act with respect to species covered under the SJMSCP.

3.4.5 - Impacts and Mitigation Measures

Significance Criteria

The City is using Appendix G of the State CEQA Guidelines as thresholds of significance for this project. According to CEQA Guidelines Appendix G, to determine whether impacts related to biological resources are significant environmental effects, the following questions are analyzed and evaluated. Would the project:

a) Has a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?

b) Has a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?

c) Has a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites?

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?

Approach to Analysis

FCS Biologists evaluated impacts on biological resources based on the likelihood that special-status species, sensitive habitats, wildlife corridors, and protected trees are present within the project site area, and the likely effects of construction or operation of the proposed project on these resources. For the purposes of this Draft EIR, the word "substantial" as used in the significance thresholds above is defined by the following three principal components:

- Magnitude and duration of the impact (e.g., substantial/not substantial),
- Uniqueness of the affected resource (rarity), and
- Susceptibility of the affected resource to disturbance.

Impacts Evaluation

Special-status Species

Impact BIO-1:	**The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service.**

Construction

An impact to special-status plant and wildlife species would be considered significant if construction of the proposed project would result in a substantial, adverse change in any of the physical conditions through habitat modification, or direct impacts to special-status species within the project site. For purposes of this analysis, impacts would be potentially significant if implementation of the proposed project would:

- Result in direct take or habitat removal (including foraging habitat) or alteration for candidate, sensitive, or special-status species.
- Remove vegetation or damage water quality related to riparian habitat or other sensitive natural community.
- Remove, fill, or damage a federally protected wetland.

Special-status Plant Species

Special-status plant species or communities are unlikely to occur on the project site, based on multiple database searches, literature review, and on-site field survey observations. The Special-status Species Table (Appendix C) provides both the habitat description and a description of the potential for special-status plant species to occur on the project site. As detailed more fully in Appendix C, the project site does not contain suitable habitat components for any special-status plant species, including valley and foothill grasslands, native perennial bunch grass communities, or alkaline soils.

None of the six special-status plant species identified in the Special-status Species Table were observed or expected to be present on the project site. Based on FCS Biologist field surveys and the lack of suitable habitat coupled with the level of past and ongoing disturbance through tilling, mowing, weed control, irrigation, and other agricultural activities, no significant impacts to special-status plant species are expected to result from construction because no such plant species are likely to be on-site.

Special-status Wildlife Species

Eight special-status wildlife species as well as birds protected under the MBTA have the potential to occur on the project site. As discussed more fully in Appendix C and below, the special-status wildlife species potentially occurring on the project site include song sparrow, tricolored blackbird, Swainson's hawk, burrowing owl, San Joaquin kit fox, pallid bat, Townsend big-eared bat, and western mastiff bat.

Song Sparrow

Song sparrow requires dense vegetation for nesting sites, song perches, and cover for refuge from predators. Where vegetation is too short and sparse, song sparrow nests are more likely to be exposed to predators. The cattail marsh vegetation within the northeastern area of the project site within the Zuriakat parcel may provide potentially suitable nesting for song sparrow. Although unlikely, the potential for this species to nest on the project site cannot be ruled out. If the cattail marsh is proposed to be removed during the nesting season, this could result in a significant impact. Therefore, Mitigation Measure (MM) BIO-1a requires a pre-construction survey be conducted to confirm that no song sparrow nest (or nest of other protected bird species) is present. If the species is found during the pre-construction survey, a setback sufficient to avoid nest failure as determined by a qualified Biologist (typically 75 feet for this species) shall be established and maintained during the nesting season for the period encompassing nest building and continuing until fledglings leave the nest(s). The setback would apply whenever construction or other ground-disturbing activities must begin during the nesting season in the presence of nests which are known to be occupied. Setbacks shall be marked by nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape to ensure maintenance of the buffer. Implementation of MM BIO-1a would reduce potential impacts to song sparrow to a less than significant level under CEQA.

Tricolored Blackbird

Emergent vegetation within the cattail marsh adjacent to California Avenue within the Zuriakat parcel represent potential nesting habitat, albeit marginal. No tricolored blackbird were observed during the site visit. The presence of a tricolored blackbird nesting colony on the project site before

or during construction is highly unlikely, but cannot be ruled out. Therefore, this constitutes a significant impact. Thus, if the cattail marsh is proposed to be removed during the nesting season, the applicants for development on any portion of the Zuriakat parcel shall implement MM BIO-1a, which requires a pre-construction survey to clear the applicable portion(s) of the project site (and setback area, if applicable) of tricolored blackbird. Additionally, minimization measures specific to tricolored blackbird nesting colonies as defined in the SJMSCP Section 5.2.4.16, and which would be imposed on project development within the Zuriakat parcel, require that a setback of 500 feet from colonial nesting areas shall be established and maintained during the nesting season for the period encompassing nest building and continuing until fledglings leave the nest(s). This setback applies whenever construction or other ground-disturbing activities must begin during the nesting season in the presence of nests which are known to be occupied. Setbacks shall be marked by nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape to ensure maintenance of the buffer. Implementation of MM BIO-1a would reduce potential impacts to tricolored blackbird to a less than significant level under CEQA.

Swainson's Hawk

Swainson's hawk nests have been observed within the greater project site vicinity; the closest recorded occurrence is across Paradise Street, directly west of the project site.[18] Additionally, this species was observed during the field survey. The SJMSCP defines known or potential Swainson's hawk nest trees as trees "that hawks are known to have nested in within the past three years or trees, such as large oaks, which the hawks prefer for nesting." The large trees present around the barn and homestead sites within the project site are not known to have supported a Swainson's hawk nest in the last 3 years but could provide potential nesting opportunity for this species. It is likely that the species utilizes the agricultural fields as foraging habitat during harvesting activities as the project site provides a small-mammal prey base for birds of prey, including Swainson's hawk.

The agricultural fields include approximately 111.84 acres of alfalfa and approximately 28.75 acres of hay, both of which provide potential foraging habitat for Swainson's hawk. Project construction would result in the loss of this foraging habitat, totaling approximately 140.59 acres, which constitutes a significant impact, and therefore must be mitigated either through payment of mitigation from the SJMSCP fee, or through a separate permitting process with the applicable resource agencies during which the required mitigation ratios will be specified. MM BIO-1b details the requirements to address the loss of foraging habitat, which would reduce potential impacts to Swainson's hawk foraging habitat to a less than significant level under CEQA. MM BIO-1b also requires a pre-construction survey and further avoidance and minimization measures (if necessary), which would reduce potential impacts to nesting Swainson's hawks to a less than significant level under CEQA with mitigation.

Burrowing Owl

Multiple recorded occurrences of burrowing owl have been documented in the vicinity of the project site. Specifically, two natal burrow complexes were reported in 2008, directly along Paradise Road

[18] California Department of Fish and Wildlife (CDFW). 2020. California Natural Diversity Database (CNDDB). Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed April 24, 2020.

between Skylark Way and Chrisman Road.[19] However, these areas have been developed since that time, and what used to be suitable burrowing owl habitat consists now of paved road and sidewalks, as well as compacted and managed landscaped areas. The closest record of an active nest that is still suitable habitat is located approximately 1.5 miles to the south. Two California ground squirrels were observed on the developed residential area within the project site during the field survey. While no suitable burrows or signs of presence of burrowing owls were observed during the field survey, it cannot be ruled out that a burrowing owl may occupy the project site before or during construction and therefore constitutes a significant impact.

Project development could result in the removal of potential habitat for burrowing owl. Implementation of MM BIO-1c, which requires a pre-construction survey and further avoidance and minimization measures (if necessary), would reduce potential impacts to burrowing owl to a less than significant level under CEQA.

San Joaquin Kit Fox

San Joaquin kit fox has been sporadically reported in the southern areas of Tracy, approximately 4 miles from the project site.[20] While San Joaquin kit fox is unlikely to occur on the project site and no dens or other signs of San Joaquin kit fox were observed during the field survey, it cannot be ruled out that a stray or migrating San Joaquin kit fox may be found on the project site before or during construction.

Project construction could result in the removal of potential habitat for San Joaquin kit fox. Implementation of MM BIO-1d, which requires a pre-construction survey and further avoidance and minimization measures (if necessary, based on the survey), would reduce potential impacts to San Joaquin kit fox to a less than significant level under CEQA.

Nesting Birds

The trees along the southwestern boundary and trees located on-site and within the immediate vicinity may provide suitable nesting habitat for birds protected under the MBTA and other special-status birds covered by Fish and Game Code Section 3503.5, and/or CESA.

Potential direct and indirect impacts could occur to resident and migratory species during project construction, which would render the project temporarily unsuitable for birds because of the noise, vibrations, and increased activity levels associated with various construction activities. These activities could potentially subject birds to risk of death or injury, and they are likely to avoid using the area until such construction activities have dissipated or ceased. Relocation, in turn, could cause hunger or stress among individual birds by displacing them into adjacent territories belonging to other individuals. Accordingly, this constitutes a significant impact requiring mitigation.

Furthermore, construction activities that occur during the nesting season (generally February 1 to August 31) could disturb nesting sites for birds protected by the MBTA and Fish and Game Code.

[19] California Department of Fish and Wildlife (CDFW). 2020. California Natural Diversity Database (CNDDB). Website: https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data. Accessed April 24, 2020.

[20] Ibid.

No action is necessary if no active nests are found or if construction occurs during the nonbreeding season (generally September 1 through January 31).

Implementation of MM BIO-1e, which requires the relevant applicant(s) for development on any areas within the project site to each conduct a pre-construction survey and implement further avoidance and minimization measures (if necessary and required by the survey), would reduce potential impacts to nesting birds to a less than significant level under CEQA. (Note that potential impacts to song sparrow, tricolored blackbird, and Swainson's hawk are addressed separately above. Mitigation measures for these species are included separately and thus are not included in MM BIO-1e).

Roosting Bats

Buildings located within the southwestern portion of the project site may provide suitable nesting habitat for bats. Section 2000 and 4150 of the California Fish and Wildlife Code states that it unlawful to take or possess a number of species, including bats, without a license or permit as required by Section 3007. Potential direct and indirect impacts could occur to roosting bats during project construction due to removal of potential roosting habitat. These activities could potentially subject bats to risk of death or injury, and they are likely to avoid using the area until such construction activities have dissipated or ceased. Relocation, in turn, could cause hunger or stress among individual bats by displacing them into adjacent territories belonging to other individuals. Accordingly, this constitutes a significant impact requiring mitigation.

Implementation of MM BIO-1f, which requires the relevant applicant(s) for development on any areas within the project site to each conduct a pre-construction survey and further avoidance and minimization measures (if necessary), would reduce potential impacts to roosting bats to a less than significant level under CEQA.

Operation

An impact to special-status plant and wildlife species would be considered significant if operation of the proposed project resulted in a substantial, adverse change in ambient noise. The project site is currently surrounded by industrial developments and is situated in a semi-urban landscape with high amounts of traffic from local industrial operations, which create a baseline of fairly substantial ambient noise. As discussed in more detail in Section 12, Noise, the proposed project would increase traffic on local roadways and would introduce stationary noise sources through the operation of new industrial facilities; however, noise emitted from the operation of the proposed project would be required to adhere to applicable established standards and would not result in a significant increase in the ambient environment. Therefore, project implementation would not constitute a significant impact to wildlife species from operational noise including traffic noise.

Bird Strike

There is a potential impact related to bird mortality caused from collisions with the glass windows on the buildings. Research on bird mortality caused by window collision remains in its early stages, and researchers have yet to agree on a collision rate metric. Additionally, there are several factors impacting the probability of birds colliding with glass windows, such as window space, opacity, glare, and other weather conditions. The proposed project would consist of several industrial buildings and related improvements, and the reflective window material used would not pose a greater hazard

than any other typical industrial buildings in the project vicinity or in the City. Window elements would not be expansive and would be predominately located at building corners or inset into the buildings. Therefore, impacts to birds associated with glass windows would be less than significant.

As such, all operational impacts would be considered less than significant.

Level of Significance Before Mitigation

Potentially Significant Impact

Mitigation Measures

MM BIO-1a Song Sparrow and Tricolored Blackbird Mitigation

Implementation of the following avoidance and minimization measures would avoid or minimize potential effects to song sparrow and tricolored blackbird as a result of project implementation within the Zuriakat parcel in and adjacent to the project site. These measures shall be implemented for construction work that occurs during the nesting season (February 1 through August 31):

- If construction or habitat removal is proposed during the breeding/nesting season (typically February 1 through August 31), a qualified Biologist shall conduct pre-construction surveys for song sparrow and tricolored blackbird within potential nesting habitat of the construction area, (special attention should be paid to the cattail marsh within the Zuriakat parcel) including a 500-foot survey buffer for tricolored blackbird and a 75-foot survey buffer for song sparrow, no more than 7 days prior to the start of ground-disturbing activities in the construction area. If no active nests are detected within the construction area on the project site or within the relevant buffer survey area, then no additional measures are required.
- If an active nest is located during pre-construction surveys, the California Department of Fish and Wildlife (CDFW) (as appropriate) shall be notified (as appropriate) regarding the status of the nest. A setback of 500 feet (for tricolored blackbird) and 75 feet (for song sparrow) shall be established and maintained during the nesting season for the period encompassing nest building and continuing until fledglings leave nests. This setback applies whenever construction or other ground-disturbing activities must begin during the nesting season in the presence of nests which are known to be occupied. Furthermore, construction activities shall be restricted in the construction area as necessary to avoid disturbance of the nest until it is abandoned, or a qualified Biologist deems disturbance potential to be minimal. Restrictions shall include consultation with a qualified Biologist to determine appropriate buffer zones or alteration of the construction schedule in the relevant area.
  - A qualified Biologist shall delineate the buffer using nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently.

MM BIO-1b Swainson's Hawk

Foraging: Prior to any activities that would result in ground disturbance to the project site, the relevant applicant(s) for the subject development on any portion of the project site shall each ensure **c**overage of the relevant portion(s) of the project site under the SJMSCP and pay the applicable fee purchase adequate mitigation through the SJMSCP for 140.59 acres of potential foraging habitat (recommended) or alternatively provide applicant-responsible compensatory mitigation at a 1:1 ratio (such as procurement of credits through a mitigation bank or dedicated of a conservation easement).

Nesting: The following measures shall be implemented for construction work during the nesting season (February 1 through August 31):

- Implementation of the following avoidance and minimization measures would avoid or minimize potential effects to Swainson's hawk as a result of project implementation and adjacent to the project site. These measures shall be implemented for construction work that occurs during the nesting season (February 1 through August 31):
  - If construction or habitat removal is proposed during the breeding/nesting season (typically February 1 through August 31), a qualified Biologist shall conduct pre-construction surveys for Swainson's hawk within the construction area, (special attention should be paid to trees with past recorded occurrences) including a 0.5- mile survey buffer, no more than 7 days prior to the start of ground-disturbing activities in the construction area. If no active nests are detected within the construction area site or within the buffer survey area, then no additional measures are required.
  - If active Swainson's hawk nests are found within the construction area or the 0.5-mile survey buffer of the project site, a qualified Biologist shall determine what nest avoidance buffers may be necessary so that construction-related activities do not cause nest abandonment. The avoidance buffer shall be submitted to the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) for approval. The qualified Biologist shall monitor construction activities to ensure construction activities do not result in adverse effects to the nest, fledglings, or adults. The Biologist shall submit a memorandum documenting construction compliance to the appropriate agencies.

MM BIO-1c Burrowing Owl

- A qualified Biologist shall conduct a pre-construction survey no later than 30 days prior to commencement of any ground-disturbing construction activities on the construction area. The survey shall be conducted in accordance with the *Staff report on Burrowing Owl Mitigation.*[21] All suitable habitats within the construction area site and adjacent buffer (within 500 feet) shall be surveyed. If no burrowing owl are detected during the surveys, then no additional measures are required.
- If pre-construction surveys during the breeding season (February 1- August 31) detect active burrows within the construction area or near the adjacent buffer survey area site, a qualified Biologist shall establish and delineate an appropriate buffer zone around the nest until the breeding season is over as determined by the Biologist. Buffer areas shall be established using the guidelines within the *Staff report on Burrowing Owl Mitigation*.
- If pre-construction surveys detect active burrows during the nonbreeding season (September 1- January 31) the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) allows for eviction or passive relocation of owls. A passive relocation plan shall be prepared and submitted to SJMSCP for approval.

MM BIO-1d San Joaquin Kit Fox

Measures to protect San Joaquin kit fox shall consist of the following:

- A qualified Biologist shall conduct a pre-construction survey of the construction area and a 200-foot buffer, between 14 and 30 days prior to the commencement of ground disturbance. If the surveys do not identify any San Joaquin kit fox activity or locate any potential dens, then no further measures are necessary.
- If the survey identifies potential dens (potential dens are defined as burrows at least 4 inches in diameter that open up within 2 feet), den entrances shall be dusted for 3 calendar days to register track of any San Joaquin kit fox present. If no San Joaquin kit fox activity is identified, potential dens may be destroyed. If San Joaquin kit fox activity is identified, then dens shall be monitored by a qualified Biologist to determine whether occupation is by an adult fox only or is a natal den (natal dens usually have multiple openings).
- If the den is occupied by an adult only, the den may be destroyed when the adult fox has moved or is temporarily absent. If the den is a natal den, a buffer zone of 250 feet shall be maintained around the den until the Biologist determines that the den has been vacated. Where San Joaquin kit fox are identified, the provisions of the United States Fish and Wildlife Service (USFWS) published *Standardized Recommendations for Protection of the San Joaquin Kit Fox Prior to or During*

[21] California Department of Fish and Wildlife (CDFW). 2012. Staff Report on Burrowing Owl Mitigation. March 7. Website: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=83843&inline=true. Accessed on April 29, 2020.

Ground Disturbance[22] shall apply (except that pre-construction survey protocols shall remain as established in this paragraph). These standards include provisions for educating construction workers regarding the San Joaquin kit fox and keeping heavy equipment operating at safe speeds.

MM BIO-1e Migratory Birds

- To prevent significant impacts to Migratory Bird Treaty Act (MBTA)-protected birds, nesting raptors, and their nests, removal of trees shall be limited to only those necessary to feasibly construct the proposed project as shown on the individual development plans approved by the City pursuant to the mapping and/or development review process.
- If any tree removal is necessary, then it should occur outside the nesting season between September 1 through January 31 to the extent feasible. If trees cannot feasibly be removed outside the nesting season, pre-construction surveys shall be conducted no more than 7 days prior to tree removal to verify the absence of active nests.
- If an active nest is located during pre-construction surveys, the United States Fish and Wildlife Service (USFWS) and/or the California Department of Fish and Wildlife (CDFW) (as appropriate) shall be notified regarding the status of the nest. Construction activities shall be restricted in the construction area as necessary to avoid disturbance of the nest until it is abandoned, or the agencies deem disturbance potential to be minimal. Restrictions shall consist of the include establishment of exclusion zones (no ingress of personnel or equipment at a minimum radius of 100 feet around an active raptor nest and an appropriate radius around an active migratory bird nest depending on the species) or alteration of the construction schedule.
- A qualified Biologist shall delineate the buffer using nest buffer signs, environmentally sensitive area fencing, pin flags, and/or flagging tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently.

MM BIO-1f Roosting Bats

- A qualified wildlife Biologist shall conduct surveys for special-status bats during the appropriate time of day to maximize detectability to determine whether bat species are roosting near the construction area no less than 7 days and no more than 14 days prior to beginning ground disturbance and/or construction. Survey methodology may include visual surveys of bats (e.g., observation of bats during foraging period), inspection for suitable habitat, bat sign (e.g., guano), or use of ultrasonic detectors (Anabat, etc.).

[22] United States Fish and Wildlife Service (USFWS). 1999. Standardized recommendations for protection of the San Joaquin Kit Fox Prior to or during ground disturbance. Website: https://www.fws.gov/ventura/docs/species/protocols/sjkf/sanjoaquinkitfox_protection.pdf. Accessed April 29, 2020.

- Visual surveys shall include trees within 0.25 mile of project construction activities. Not more than two weeks prior to building demolition, the Tracy Alliance parcel applicants for development on any project parcel, shall ensure that a qualified Biologist (i.e., one familiar with the identification of bats and signs of bats) survey buildings proposed for demolition for the presence of roosting bats or evidence of bats. If no roosting bats or evidence of bats are found in the structure, demolition may proceed. If the Biologist determines or presumes bats are present (if there are site access issues or structural safety concerns), the Biologist shall exclude the bats from suitable spaces by installing one-way exclusion devices. After the bats vacate the space, the Biologist shall close off the space to prevent recolonization. Building demolition of the subject structure shall only commence after the Biologist verifies seven to 10 days later that the exclusion methods have successfully prevented bats from returning. To avoid significant impacts on non-volant (i.e., nonflying) bats, the Biologist shall only conduct bat exclusion and eviction from May 1 through October 1. Exclusion efforts shall also be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young).

Level of Significance After Mitigation

Less Than Significant Impact With Mitigation Incorporated

Sensitive Natural Communities

Impact BIO-2:	**The proposed project would not have a substantial adverse effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service.**

Construction

An impact to sensitive natural communities or riparian habitat would be considered significant if the construction of the proposed project resulted in a substantial, adverse change in any of the physical conditions (such as removal of vegetation or fill within riparian habitat) within the area affected by development.

As noted above, a small portion of the project site contains approximately 0.07 acre of cattail marsh in the channel along California Avenue, on the northern boundary of the project site within the Zuriakat parcel. The majority of the cattails consisted of broadleaf cattails; this vegetation type is not classified as a sensitive natural community, but rather a California Natural Community by the CDFW (Type 52.050.04– Typha [*latifolia, angustifolia]*) and is not applicable to this resource category. This community is discussed in further detail below in Impact BIO-3.

The project site does not contain any riparian habitat or sensitive natural communities identified in local or regional plans, policies, or regulations, by the CDFW or USFWS. As such, impacts would be less than significant under CEQA.

Operation

The project site does not contain any riparian habitat or other sensitive natural communities. As such, all operational impacts would be considered less than significant.

Level of Significance

Less Than Significant Impact. No Mitigation Required.

Wetlands

Impact BIO-3:	**The proposed project could have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.**

Construction

Impacts to State or federally protected wetlands would be considered significant if the proposed operations resulted in a substantial, adverse change in any of the physical conditions (i.e., fill) of wetlands.

A preliminary assessment of potentially jurisdictional features was conducted as part of the literature review and reconnaissance-level survey for the site. There are aquatic resources located within the project site in the form of irrigation/drainage channels (approximately 10,344 linear feet) and a potential ditch wetland/cattail marsh (approximately 0.07 acre) located on the Zuriakat parcel.

Ditch Wetland/Cattail Marsh

The ditch wetland/cattail marsh located on the Zuriakat parcel along California Avenue is likely formed due to the drainage patterns created as a result of surrounding agricultural production. This potential Zuriakat parcel wetland feature contained standing water during the field visit, contained dense stands of broadleaf cattail (rated an obligate wetland plant by the USACE and a California Natural Community), and supports Northern Pacific tree frogs. This potentially jurisdictional wetland feature is approximately 300 feet long by 8 feet wide.

Irrigation/Drainage Channels

The irrigation/drainage channels appear to have a potential hydrological connection to the San Joaquin River, a traditional navigable water of the United States. The man-made channels have all been excavated within upland habitat for the purpose of on-site agricultural irrigation and drainage. These channels are mostly devoid of hydrophytic vegetation, are actively managed, and provide little to no habitat value to special-status species. This potential aquatic feature is approximately 10,344 linear feet. For the foregoing reasons, these features are generally not considered jurisdictional.

The determination whether an aquatic feature is regulated pursuant to CWA Section 404 can only be made by the USACE following a formal delineation of aquatic resources and proposed jurisdictional determination. Similarly, the RWQCB intends to follow jurisdictional exclusions of the USACE; however, California Water Code Section 13050(a) defines “waters of the State” broadly to include “any surface water or groundwater, including saline waters, within the boundaries of the State,” and the determination whether impacts to parts of the irrigation/drainage ditches and/or the cattail marsh on-site are regulated as waters of the State is be made by the RWQCB. If the proposed project

construction would result in the placement of fill that would potentially result in impacts to these aquatic resources, then implementation of MM BIO-3 would reduce potential impacts to a less than significant level under CEQA.

Operation

Impacts related to the project's potential effect on State or federally protected wetlands are limited to construction impacts. As such, all operational impacts would be considered less than significant.

Level of Significance Before Mitigation

Potentially Significant Impact

Mitigation Measures

MM BIO-3 Conduct Delineation of Potentially Jurisdictional Aquatic Resources (Channels and Wetlands)

The applicant(s) for development on any project parcel shall complete a formal jurisdictional delineation to document and quantify the full extent of potentially jurisdictional waters for the relevant project parcel(s) in coordination with the applicable regulatory agencies. The applicant(s) for development on any project parcel shall also coordinate, to the extent required under applicable laws and regulations, with the applicable regulatory agencies (United States Army Corps of Engineers [USACE], Regional Water Quality Control Board [RWQCB], and/or California Department of Fish and Wildlife [CDFW]) to determine whether the irrigation/drainage channels and/or cattail marsh on the project site is protected under Section 404 and 401 of the Clean Water Act (CWA) and/or Section 1602 of the California Fish and Game Code.

Obtain CWA Sections 401 and 404 Permits Prior to Construction

- Prior to the fill of any potentially jurisdictional waters within the project site, the relevant project applicant(s) for the subject project parcel(s) shall consult with the USACE and Regional Water Quality Control Board, to the extent required under applicable laws and regulations, to determine the extent, if at all, that waters of the United States and State may be impacted by the proposed project.
- If required, the relevant applicant(s) for development of the subject project parcel(s) shall obtain a Section 404 CWA permit for impacts to waters of the United States. That same applicant, for development of the subject project parcel(s), will also obtain a Section 401 Water Quality Certification from the RWQCB, if required. Any such required permit and certification shall be obtained prior to issuance of grading permits for the implementation of the individual development proposal on the subject project parcel(s).
- The applicant(s) for development on any project parcel shall design the project to result in no net loss of functions and values of waters of the United States and State by incorporating impact avoidance, impact minimization, and/or

compensatory mitigation for the impact, as set forth in the subject Section 404 permit and 401 water quality certification.

- Compensatory mitigation may consist of (1) obtaining credits from a mitigation bank; (2) making a payment to an in-lieu fee program that would conduct wetland, stream, or other aquatic resource restoration, creation, enhancement, or preservation activities; and/or (3) providing compensatory mitigation through an aquatic resource restoration, establishment, enhancement, and/or preservation activity. This final type of compensatory mitigation may be provided at or adjacent to the impact site (i.e., on-site mitigation) or at another location, usually within the same watershed as the permitted impact (i.e., off-site mitigation). This project/permit applicant shall retains responsibility for the implementation and success of the mitigation approach.

Obtain Approval of and File Notification of Streambed Alteration Agreement Prior to Construction

The applicant(s) for development on any project parcel shall ensure that the cattail marsh is not obstructed and human intrusion into the area is minimized. In compliance with Section 1600 of the California Fish and Game Code, the relevant applicant(s) of an individual development proposal within the project site shall obtain approval and file a notification of a Streambed Alteration Agreement prior to conducting any construction activities within irrigation/drainage channels that qualify as streams under CDFW jurisdiction (i.e., those having bed and bank and at least periodical flow) if and to the extent required under applicable laws and regulations. Those same applicant(s) shall implement all mitigation measures imposed by the CDFW related to the subject Streambed Alteration Agreement, which may include but not be limited to the implementation of erosion and bank stabilization measures, riparian habitat enhancement, and/or restoration and revegetation of the stream corridor habitat at no less than a 1:1 ratio, as determined by the CDFW.

Level of Significance After Mitigation

Less Than Significant Impact With Mitigation Incorporated

Fish and Wildlife Movement Corridors

Impact BIO-4:	**The proposed project would not substantially interfere with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.**

Construction

An impact to fish or wildlife movement would be considered significant if the proposed construction or operation resulted in a substantial, adverse change in any of the physical conditions (such as the interruption of a channel or terrestrial movement corridor) within the area affected by the proposed

project. Fish or wildlife movement that have the potential to be impacted are discussed in detail below.

FCS Biologists evaluated the project site for evidence of a wildlife movement corridor during the biological resources survey. As noted above, the site is surrounded by industrial developments and is situated in a semi-urban landscape with high amounts of traffic from local industrial operations. Further, I-205 separates the site from the closest wildlife corridor to the north, I-5 and Business I-205 preclude non-volant wildlife movement from the east and southeast. The project site is not part of or within a wildlife movement corridor and, for this reason, construction-related impacts would be less than significant under CEQA.

Operation

As noted above, the project site is not part of or within a wildlife movement corridor. As such, all operational impacts would be considered less than significant.

Level of Significance

Less Than Significant Impact

Local Biological Resources Policies/Ordinances Consistency

Impact BIO-5:	**The proposed project would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.**

Construction and Operation

The project site contains a pecan orchard as well as ornamental trees but no street trees. As noted in Section 3.4.3, the City of Tracy regulates the alteration or removal street trees, but does not have a Tree Protection Ordinance related to private property. Therefore, because the project site does not contain any street trees, the proposed project would not conflict with any tree preservation policy or ordinance. Additionally, the proposed project would not conflict with General Plan policies or ordinances protecting biological resources. As such, no impacts related to construction would occur and no mitigation is necessary.

Level of Significance

No Impact

Habitat/Natural Community Conservation Plan Consistency

Impact BIO-6:	**The proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.**

Construction

The project site is located within the SJMSCP Planning Area, and the City is a signatory to the SJMSCP, and the proposed project would be required to adhere to the relevant provisions of the SJMSCP. Participation in the SJMSCP ensures that potential impacts for covered species are mitigated below a level of significance in compliance with CEQA as well as the Endangered Species Act and CESA. Therefore, the proposed project would be subject to compliance to the SJMSCP, which may

include payment of development fees for the conversion of lands that may provide habitat for covered special-status species as well as implementation of other identified mitigation measures. Mitigation for loss of open space (agricultural field) would be achieved via the payment of habitat fees, or by the payment of endowment fees with in-lieu lands (conservation easements). Implementation of mitigation required under the SJMSCP and minimization measures (as identified above in Impact BIO-1) in conjunction with required compliance with the SJMSCP would reduce specific impacts to listed species to a less than significant level under CEQA.

Operation

Any potential conflicts with the SJMSCP would be limited to the construction phase of the proposed project and would be mitigated appropriately. Therefore, no operational impacts related to conflicts with the SJMSCP would occur.

Level of Significance

Less Than Significant Impact

3.4.6 - Cumulative Impacts

The general geographic scope of the cumulative biological resources analysis is concentrated south of I-205 and north of West Linne Road within the City of Tracy's SOI as project activity would only affect the surrounding project area. Cumulative projects in the geographic scope of the biological resources analysis include active agricultural fields consisting of alfalfa, almond tree orchards, and hay; associated agricultural and a few rural residential structures and irrigation/drainage channels are interspersed throughout the project site. Additionally, a ruderal/disturbed area is located within the southwestern corner of the project site along Grant Road Line that shows evidence of previous development but does not have current development. The project's immediate vicinity consists of agricultural and industrial development. project site and immediate vicinity

Special-status Wildlife and Plant Species

Planned developments listed in Chapter 3, Environmental Impact Analysis, Table 3-1 and shown in Exhibit 3-1, are predominantly located in areas that have already been built out or are located within highly fragmented habitats with limited potential to support special-status wildlife and plant species. The cumulative geographic context is partially developed and partially agricultural land, and there is a low likelihood of special-status wildlife and plants occurring within the cumulative project areas due to past urban development.

The following species have the potential to occur within the cumulative project areas: song sparrow, tricolored blackbird, Swainson's hawk, burrowing owl, San Joaquin kit fox, pallid bat, Townsend big-eared bat, and western mastiff bat. Additionally, nesting birds protected by the MBTA and/or California Fish and Game Code also have the potential to occur within the cumulative project areas. As described in the Regulatory Setting section, numerous laws and regulations are in place to protect biological resources within the cumulative project area, including, but not limited to, CESA, FESA, and the CWA. Future projects within the cumulative geographic context, would be required to comply with applicable federal, State, and local laws, regulations, and policies and all applicable permitting requirements of the regulatory and oversight agencies intended to address potential

impacts on biological resources. Standard pre-construction surveys and, if necessary, avoidance procedures would be required for cumulative projects with the potential to impact special-status wildlife species (see, e.g., MM BIO-1a through MM BIO-1f). Because cumulative development would be required to comply with the above requirements, as well as General Plan and Municipal Code requirements (as described in the Regulatory Framework section), cumulative biological impacts would be less than significant.

Moreover, the proposed project's incremental contribution to these less than significant cumulative impacts would not be significant with adherence to the mitigation measures related to special-status wildlife species identified above and compliance with other applicable standards and requirements under the comprehensive regulatory framework. Therefore, the proposed project would have a less than significant incremental contribution to cumulative impacts to biological resources.

Sensitive Natural Communities and Wetlands

There are various aquatic resources that provide habitat for riparian species of flora and fauna within the cumulative project areas. The Great Valley Riparian Woodland communities lie north of I-205, along the Old River and Tom Paine Slough riparian zones. Corral Hollow Creek flows northeast and is located immediately east of I-580. These aquatic resources are largely found outside the cumulative project areas, which are concentrated south of I-205 and north of West Linne Road within the City of Tracy's SOI as projects activities would only affect the surrounding project areas. The majority of cumulative developments have been designed to address future growth problems and minimize developmental impacts to sensitive natural communities by designing projects, to the extent feasible, to occur in previously developed or highly disturbed areas that lack significant sensitive natural communities.

Within the cumulative project areas, development would not directly and significantly impact sensitive natural communities and/or the aquatic resources outlined above because they are largely sited in previously developed or highly disturbed areas. Furthermore, cumulative projects with the potential to impact sensitive natural communities (including wetlands or riparian habitat) would be required to consult with the applicable regulatory agencies, quantify their potential impacts in a formal jurisdictional delineation, and mitigate accordingly as may be required pursuant to applicable laws and regulations (see, e.g., MM BIO-3). As such, there is a less than significant cumulative impact. Moreover, as explained in Impact BIO-2 and Impact BIO-3, the proposed project would implement mitigation measures to address potential and the proposed project's contribution to the cumulative impact would be less than significant. Additionally, the proposed project's contribution to the less than significant cumulative impact would not be cumulatively considerable. The proposed project, in conjunction with other cumulative projects, would result in a less than significant cumulative impact related to sensitive natural communities and associated habitat.

Local Tree Policies or Ordinances or Other Policies to Protect Biological Resources

The City of Tracy regulates the alteration or removal street trees but as previously stated, does not have a Tree Protection Ordinance related to private property. While other cumulative projects may result in the removal of street trees, these projects would be governed by the applicable local protection ordinance including relevant General Plan policies, which includes permitting and

mitigation requirements. Therefore, development of the proposed project and any related development of private property would not result in any conflicts with local tree policies or ordinances protecting trees or other biological resources. As such, there is a less than significant cumulative impact. Additionally, the proposed project's contribution to the less than significant cumulative impact would not be cumulatively considerable.

Fish and Wildlife Movement Corridors

The cumulative project areas contain a variety of aquatic resources that act as potential movement corridors for fish and wildlife, such as Corral Hollow Creek and Tom Paine Slough. Any future development that occurs within the cumulative project areas would have to take into account the potential impact to these corridors and mitigate as required under applicable laws and regulations.

The site is surrounded by industrial developments and is situated in a semi-urban landscape with high amounts of traffic from local industrial operations. Further, I-205 separates the site from the closest wildlife corridor to the north, I-5 and Business I-205 preclude non-volant wildlife movement from the east and southeast. The project site is not part of or within a wildlife movement corridor and construction-related impacts would be less than significant under CEQA. Therefore, the proposed project's contribution to the less than significant cumulative impact related to fish, and wildlife movement would not be cumulatively considerable.

Habitat and Natural Community Conservation Plan Consistency

The proposed project, in addition to other cumulative projects, would be subject to compliance to the SJMSCP, which may include payment of development fees for conversion of lands that may provide habitat for covered special-status species and implementation of other identified mitigation measures under the SJMSCP. Compliance by the proposed project and other cumulative projects located within the cumulative project areas to the SJMSCP would fully mitigate any potentially significant impacts in this regard. As such, there is a less than significant cumulative impact. Additionally, the proposed project's contribution to the less than significant cumulative impact would not be cumulatively considerable given that it also would be required to comply with all applicable provisions and mitigation requirements under the SJMSCP. Therefore, cumulative projects in conjunction with the proposed project would not conflict with the SJMSCP. As such, cumulative impacts would be less than significant.

3.5 - Cultural Resources

3.5.1 - Introduction

This section describes the existing environmental setting for cultural resources setting and the potential impacts on cultural resources on the project site and its surrounding area that may result from project implementation. The study area includes the project site and the 0.5-mile search radius around the project site. The descriptions and analysis in this section are based, in part, on information provided by the Native American Heritage Commission (NAHC), a records search of the Sacred Lands File, archival research, and a pedestrian survey, as presented in the Phase I Cultural Resource Assessment (Phase I CRA) that FirstCarbon Solutions (FCS) prepared for this project (see Appendix D). The recommendations provided in the Phase I CRA to address potential project impacts on cultural resources during ground-disturbing activities are incorporated into this section where appropriate.

3.5.2 - Environmental Setting

Cultural Resources Components

The term "cultural resources" encompasses historic resources, archaeological resources, and burial sites, which are generally defined as follows:

- **Historic Resources:** Historic resources are associated with the recent past. In California, historic resources are typically associated with the Spanish, Mexican, and American periods in the State's history and are generally less than 200 years old. Historic resources often take the form of buildings, structures, and other elements of the built environment.
- **Archaeological Resources:** Archaeology is the study of artifacts and material culture with the aim of understanding human activities and cultures in the past. Archaeological resources may be associated with prehistoric indigenous cultures as well as historic periods.
- **Burial Sites and Cemeteries:** Burial sites and cemeteries are formal or informal locations where human remains have been interred.

Overall Cultural Setting

Following is a brief overview of the prehistory, ethnography, and historic background, providing a context in which to understand the background and relevance of sites found in the vicinity of the project site. This section is not intended to be a comprehensive review of any specific resources in the project vicinity; rather, it serves as a general overview. Further details can be found in ethnographic studies, mission records, and major published sources.[1,2,3,4,5,6,7]

Prehistory and Ethnographic Background

The Northern San Joaquin Valley remains one of the least known ethnographic areas of California. Although little record of their culture has survived, research indicates Native Americans occupied portions of northern San Joaquin County for over 10,000 years.

Early archaeological investigations in Central California were conducted at sites located in the Sacramento-San Joaquin Delta region. The first published account documents investigations in the Lodi and Stockton area.[8] The initial archaeological reports typically contained descriptive narratives, with more systematic approaches sponsored by Sacramento Junior College in the 1930s. At the same time, University of California at Berkeley excavated several sites in the lower Sacramento Valley and Delta region, which resulted in recognizing archaeological site patterns based on variations of inter-site assemblages. Research during the 1930s identified temporal periods in Central California prehistory and provided an initial chronological sequence.[9,10] In 1939, Lillard noted that each cultural period led directly to the next and that influences spread from the Delta region to other regions in Central California.[11] In the late 1940s and early 1950s, Beardsley documented similarities in artifacts among sites in the San Francisco Bay region and the Delta and refined his findings into a cultural model that ultimately became known as the Central California Taxonomic System (CCTS). This system proposed a uniform, linear sequence of cultural succession.[12] The CCTS system was challenged by Gerow, whose work looked at radiocarbon dating to show that Early and Middle Horizon sites were not subsequent developments but, at least partially, contemporaneous.[13,14,15]

To address some of the flaws in the CCTS system, Fredrickson introduced a revision that incorporated a system of spatial and cultural integrative units.[16] Fredrickson separated cultural, temporal, and spatial units from each other and assigned them to six chronological periods: Paleo-Indian (12,000 to 8000 Before Present [BP]); Lower, Middle and Upper Archaic (8000 BP to 1500 BP), and Emergent (Upper and Lower, 1500 BP to historic period). The suggested temporal ranges are similar to earlier horizons, which are broad cultural units that can be arranged in a temporal sequence.[17] In addition, Fredrickson defined several patterns—a general way of life shared within a specific geographical region. These patterns include:

- Windmiller Pattern or Early Horizon (5000 to 3000 BP)
- Berkeley Pattern or Middle Horizon (3000 to 1500 BP)
- Augustine Pattern or Late Horizon (1500 BP to historic period)

Brief descriptions of these temporal ranges and their unique characteristics follow.

Windmiller Pattern or Early Horizon (5000 to 3000 BP)

Characterized by the Windmiller Pattern, the Early Horizon was centered in the Cosumnes district of the Delta and emphasized hunting rather than gathering, as evidenced by the abundance of projectile points in relation to plant processing tools. Additionally, atlatl, dart, and spear technologies typically included stemmed projectile points of slate and chert but minimal obsidian. The large variety of projectile point types and faunal remains suggests exploitation of numerous types of terrestrial and aquatic species.[18,19] Burials occurred in cemeteries and intra-village graves. These burials typically were ventrally extended, although some dorsal extensions are known with a westerly orientation and a high number of grave goods. Trade networks focused on acquisition of ornamental and ceremonial objects in finished form rather than on raw material. The presence of artifacts made of exotic materials such as quartz, obsidian, and shell indicate an extensive trade network that may represent the arrival of Utian populations into Central California. Also indicative of this period are rectangular Haliotis and Olivella shell beads, and charmstones that usually were perforated.

Berkeley Pattern or Middle Horizon (3000 to 1500 BP)

The Middle Horizon is characterized by the Berkeley Pattern, which displays considerable changes from the Early Horizon. This period exhibited a strong milling technology represented by minimally shaped cobble mortars and pestles, although metates and manos were still used. Dart and atlatl technologies during this period were characterized by non-stemmed projectile points made primarily of obsidian. Fredrickson suggests that the Berkeley Pattern marked the eastward expansion of Miwok groups from the San Francisco Bay Area.[20] Compared with the Early Horizon, there is a higher proportion of grinding implements at this time, implying an emphasis on plant resources rather than on hunting. Typical burials occurred within the village with flexed positions, variable cardinal orientation, and some cremations. As noted by Lillard, the practice of spreading ground ochre over the burial was common at this time.[21] Grave goods during this period are generally sparse and typically include only utilitarian items and a few ornamental objects. However, objects such as charmstones, quartz crystals, and bone whistles occasionally were present, which suggest the religious or ceremonial significance of the individual.[22] During this period, larger populations are suggested by the number and depth of sites compared with the Windmiller Pattern. According to Fredrickson, the Berkeley Pattern reflects gradual expansion or assimilation of different populations rather than sudden population replacement and a gradual shift in economic emphasis.[23]

Augustine Pattern or Late Horizon (1500 BP to Historic Period)

The Late Horizon is characterized by the Augustine Pattern, which represents a shift in the general subsistence pattern. Changes include the introduction of bow and arrow technology; and most importantly, acorns became the predominant food resource. Trade systems expanded to include raw resources as well as finished products. There are more baked clay artifacts and extensive use of Haliotis ornaments of many elaborate shapes and forms. Burial patterns retained the use of flexed burials with variable orientation, but there was a reduction in the use of ochre and widespread evidence of cremation.[24] Judging from the number and types of grave goods associated with the two types of burials, cremation seems to have been reserved for individuals of higher status, whereas other individuals were buried in flexed positions. Research indicates that Augustine Pattern represents expansion of the Wintuan population from the north, which resulted in combining new traits with those established during the Berkeley Pattern.[25]

Central California research has expanded from an emphasis on defining chronological and cultural units to a more comprehensive look at settlement and subsistence systems. This shift is illustrated by the early use of burials to identify mortuary assemblages and more recent research using osteological data to determine the health of prehistoric populations.[26] Although debate continues over a single model or sequence for Central California, the general framework consisting of three temporal/cultural units is generally accepted, although the identification of regional and local variation is a major goal of current archaeological research.

Northern Valley Yokuts

Prior to European American contact, the Tracy area was inhabited by the Northern Valley Yokuts, whose range extended from the Calaveras River to the southern extent of the San Joaquin River. The Northern Valley Yokuts were one of three major subgroups that occupied much of the San Joaquin Valley: the Northern Valley, the Foothill, and the Southern Valley Yokuts. Each of these ethnolinguistic groups was composed of autonomous, culturally, and linguistically related tribes or tribelets. Ethnographic evidence suggests the project site was part of the Northern Valley Yokuts territory.

The Northern Valley Yokuts, who lived along the San Joaquin River and its tributaries and within the vicinity of the project site, are one of the least known of the California Indian groups. This is due to the almost complete destruction of their tribal life in the early 19th Century. What can be gleaned from the diaries and reports of Spanish soldiers and priests is that fish, waterfowl, and acorns were important food resources for the Northern Valley Yokuts. The local rivers and their tule marshes contained salmon, sturgeon, perch, suckers, and pike, which were caught using nets, weighted with stone sinkers and bone harpoons. Waterfowl, such as geese, ducks, and other aquatic birds, were abundant in the marshes and probably played a major role in the Northern Valley Yokuts subsistence base.[27] Dogs were domesticated and may have been raised for food, a taboo to some tribes but not

the Yokuts.[28,29] Wild plant resources, especially acorns, were of prime importance and in a good year, a valley oak could produce 300 to 500 pounds of acorns, which were then ground into meal and cooked into porridge. Tule reed roots were likewise gathered and ground into meal that was traditionally served as porridge.[30]

Stone mortars and pestles, milling stones, hammers, choppers, and projectile points were manufactured from local rock sources. Notably, although obsidian was imported into the area, it was used infrequently for tools or weapons. Bone tools, particularly awls, were used in basket manufacture. Most villages were built near rivers on elevated land to avoid flooding during heavy rains or spring runoff from the Sierras. Archaeological excavations in Merced and Fresno counties indicate that houses were single-family dwellings, probably made with an oval framework of lightweight poles covered by mats of tule reeds. Hard-packed earthen floors 25 to 40 feet in diameter were constructed several feet below ground level. Communities typically contained a sweathouse and sometimes a large ceremonial structure. The size of the Yokuts communities is uncertain, but estimates indicate that the principal settlements contained 200–250 inhabitants.[31]

Several northern Yokut tribelets lived near what is now Tracy: including the Chulamni to the north, and the Hoyima to the southeast. The Chulamni tribelet built their villages near Tracy, along the banks of the Old River and San Joaquin River, and along creeks in the Diablo Range. The largest Chulamni village site near Tracy was named "Pescadero" by the Spanish during one of their first expeditions in 1810 and 1811.

Contact with Europeans was particularly devastating for the Northern Valley Yokuts. This group was adversely impacted by missionization in the early 1800s, European diseases, and the influx of miners and settlers as a result of the 1849 gold rush. Kroeber observed that their habitat in the open river valley left them especially vulnerable, compared to mountain dwellers, to "the full brunt of civilization."[32]

Contact with the Spanish commenced early in the 19th Century and normally consisted of sporadic visits by small exploration parties. However, between 1805 and the 1820s, Franciscan priests from the coastal missions began recruiting converts from further inland, and a large portion of the Yokuts population was taken to various missions in San José, Santa Clara, Soledad, San Juan Bautista, and San Antonio. Many neophytes deserted and returned to their homes, but were sought and brought back by Spanish soldiers. A decade after the Mexican government claimed independence from Spain in 1822, the missions were converted into parish churches, and many Native Americans were released and returned to their former territory, though not necessarily to the specific location from which they came.

After the American conquest of California in 1846, the remaining Northern Valley Yokuts were driven off their land by miners heading south, farmers pursuing the locally rich soil, and the construction of

various railroads. By the time scholars were interested in gathering information on California native groups, there were few people left to provide descriptions of native life before European contact.[33]

Regional Historic Background

Spanish Period (1769-1821)

The formalization of Spanish routes in California were established by Father Junípero Serra and Gaspar de Portolà in 1769, in what was known as the Portolà Expedition. Although the Portolà party were not the first Europeans nor the first people to pass through the region, it was their observations and discoveries that formalized the routes and locations of the Mission System and facilitate trade and travel through California.[34] The route used by Portolà was further explored in detail by Lieutenant Colonel Juan Bautista de Anza and Father Pedro Font during the Anza Expedition that lasted from 1775-1776. The Anza Expedition was considered pivotal as it helped establish practical relationships with the natives, who at the time were revolting in San Diego, and help further explore and map Monterey and the San Francisco Bay Area.[35] The region that would become San Joaquin Valley was periodically visited by Franciscan friars, scouting the area for mission sites, but it was a military expedition led by Gabriel Moraga in September and October of 1806 that fully mapped out the area. The expedition started in San Juan Bautista and extended to the San Joaquin Plain. Once there, Moraga traversed several tributaries that flow to the San Joaquin River and discovered and named the Merced River. Moraga additionally came upon the Tuolumne, Stanislaus, and Mokelumne Rivers. Moraga's Expedition took him from the foot of the Sierras and the Rancherias between Kings River and Kern River. In 1808, Moraga traveled to Stockton and headed east to scouting sites for future missions. Moraga's discoveries and mapping of the region contributed to the knowledge of the geography and ethnography of the area. This information served pivotal to Father Narciso Duran, Father Ramón Abella and Lieutenant Luis Antonio Argüello, who followed the San Joaquin River at least as far as the Stockton Channel in 1817, meticulously mapping the area for future mission establishments.[36,37] The diary kept by Father Duran helped illustrate how the region appeared prior to colonization as well as initial contact with the Yokut people.

The Mexican Period (1821-1848)

The Mexican revolt against Spain in 1822 and the secularization of the missions in 1834 changed land ownership patterns in California. The Spanish philosophy of government was directed at the founding of presidios, missions, and secular towns with the land held by the Crown, whereas the later Mexican policy stressed individual ownership of the land. Following Mexico's independence from Spain in 1822, the vast mission lands were granted to private citizens. The last of the mission land holdings were relinquished in 1845, which led the way for the large ranchos common to California in the mid-1800s.

However, the constant threat of Russian invasion, the illegal squatting of American immigrants and growing threat of rebellion from the mission Indians prevented the region from achieving socio-political stability.[38] The growing tensions between Mexicans and American settlers led to the Bear Flag Revolt of 1846 led by U.S. Army Captain John C. Fremont and Ezekiel Merritt against Mexican General Mariano Vallejo who was attempting to bring aid to the Mexican governor of California in an attempt to suppress the growing wave of support for an American coup of California.[39] The rebellion concluded with the takeover of Sonoma, thus weakening the little control that Mexico had over Alta California and paving the way for the United States to seize control of the Pacific Coast shortly thereafter.[40]

By 1846, on the eve of the U.S.–Mexican War (1846 to 1848), the estimated population of California was 8,000 non-natives and 10,000 Native Americans. However, these estimates have been debated. Cook suggests the Native American population was 100,000 in 1850; the U.S. Census of 1880 reports the Native American population as 20,385.[41]

City of Tracy, San Joaquin County

San Joaquin County was incorporated on January 4, 1850 as one of the California's original 27 counties after acquiring statehood. San Joaquin County was named after the river that runs through the entire San Joaquin Valley. The county was formed from four land grants: El Pescadero, Campo de los Franceses, Los Moquelemos, and the Thompson Rancho, in addition to land that belonged to the State.[42] The county seat is in Stockton and has remained there since the inception of the City in 1850. In addition to Stockton, San Joaquin County includes the incorporated cities of Escalon, Lathrop, Lodi, Manteca, Ripon, and Tracy.[43] San Joaquin County is 1,391.32 square miles and has a population of 762,148 residents.[44]

The City of Tracy has deep roots with the railroad industry, as the community was founded after Southern Pacific Railroad established a new connecting rail line from "Oakland around the shores of San Francisco Bay, through Port Costa and Martinez, to connect with the Central Pacific line east of the Livermore hills and Altamont Pass."[45] Following the completion of the connecting rail line on September 8, 1878, the community of Tracy was formed and named after Southern Pacific Railroad executive, Lathrop J. Tracy.

Tracy grew rapidly with the addition of businesses associated with the rail line. Two hotels, Ludwig Hotel and Tracy Hotel, prompted residents from nearby towns to settle in the newly established community that was quickly becoming the railroad and commercial center of Tulare Township. This was followed by the relocation of the railroad headquarters on March 1, 1894 from Lathrop to Tracy, in addition, all railroad equipment, building and eating house accompanied the headquarters in the

move. Toward the end of the 1800s, the community of Tracy experienced an agricultural boom following the construction of the Delta levee that provided irrigation to the crops that were rapidly becoming the main source of revenue for community. In 1910, Tracy was officially incorporated and continued to flourish agriculturally after its first irrigation district was established in 1915.[46]

Tracy remained a relatively small agricultural town well into the mid-20th century; however, with population growth in the Bay Area in the 1970s, Tracy saw in influx of people, taking advantage of its real estate while maintaining relatively close proximity the Bay Area. As of 2019, the City of Tracy boasted a population of about 94,740.[47]

Records Searches and Pedestrian Survey to Identify Existing Cultural Resources

Central Coastal Information Center

On April 2, 2020, a record search for the project site and a 0.5-mile radius[48] beyond the project boundaries was conducted at the Central California Information Center (CCIC) located at California State University, Stanislaus. The current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the California Historical Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the Built Environment Resources Directory (BERD) for San Joaquin County were also reviewed to determine the existence of previously documented local historical resources.

The results from the CCIC indicate that five cultural resources have been recorded on-site or within 0.5 mile of the project site. The prehistoric resource (P-39-000258) and the historic resources (P-39-000002, P-39-000072, P-39-004373 and P-39-005104) are all located outside the project site (Table 3.5-1). The historic resource P-39-000072 is adjacent to and outside of the project site to the southwest, while historic resource P39-004373 is located along the southern boundary of the site, adjacent to and outside of the project site. Resources P-39-005104, P-39-000002, and P-39-000258 are not located in close proximity to areas of proposed development. All identified resources would remain unaffected by the project, as currently designed, because none of the resources are located within the project boundary. In addition, three area-specific survey reports are on file with the CCIC for the search radius; none of which are within the project site boundary indicating that the project site has not previously been surveyed for cultural resources (Table 3.5-2).

Table 3.5-1: Recorded Cultural Resources On-site or within a 0.50-mile Radius of the Project Site

Historic Aerials

A review of 10 historic aerials depicting the project site and vicinity from 1967 until 2016 indicate that beginning in 1967, the project site and the surrounding general land areas were developed for agricultural purposes along with a residential property within the southwest corner of the site.[49] The 1968 image depicts residential development southeast of the project site, and the expansion of dairy buildings in the southwest corner. Sometime between 1968 and 1982, Interstate 205 (I-205) was constructed, and the area became more urbanized; residential and commercial development was prevalent throughout the surrounding area. Aerials from 1993 to 2016 exhibit the continued agricultural uses of the project site, along with expansion and the continued use of the dairy farm.

[49] Historic Aerials. 2020. Website: https://www.historicaerials.com/viewer. Accessed: March 31, 2020.

Cultural Resources Pedestrian Survey

Prior to the current pedestrian survey, readily available historical United States Geological Survey (USGS) topographic maps, selected historical aerial photographs (at approximately 10- to 15-year intervals) and historical fire insurance maps produced by the Sanborn Map Company were reviewed to evaluate land development and obtain information concerning the history of development on and near the site. These records show undeveloped land with an unimproved road near the northeast corner (1914-1916); followed by the development of multiple farm structures near the southwestern corner and agricultural row crops, irrigation ditches, and/or vacant land on the remainder of the property (1937-2016).

On April 9, 2020, FCS Senior Archaeologist, Dr. Dana DePietro, conducted a pedestrian survey for unrecorded cultural resources within the Tracy Alliance, Suvik Farms, and Zuriakat project parcels that comprise the project site. The survey began in the north of the project boundary and moved south, using east–west transects spaced at approximately 5-meter intervals within the project boundary, where possible.

Visibility of native soils was very poor overall, given that approximately 90 percent of the Tracy Alliance and Zuriakat parcels were covered with thick vegetation. Soil visibility was better in the Suvik Farms parcels (70 percent visibility) due to the rowed almond orchard that occupies this portion of the site. Soils in these sections of poor visibility were intermittently inspected using a hand trowel and were largely composed of light brown (7.5YR 5/3) loam with low clay content. The soils were interspersed with small to large (3 to 30 cm) stones primarily composed of schist and chert.

Survey conditions were documented using digital photographs and field notes. During the survey, Dr. DePietro examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, tool-making debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics). Particular attention was paid to the Mattos Dairy Farm complex located in the southwest corner of the project site, which was found to be over 50 years old. An evaluation of the Mattos Dairy Farm complex's historic significance and eligibility for listing on the CRHR follows below.

Architectural and Historic Resources Assessment

The Mattos Dairy Farm complex is located in the southwest corner of the project site and contains buildings and structures over 50 years old that have not been evaluated for historic significance. Properties over 50 years in age are considered potentially eligible for listing in the NRHP, CRHR, or local listing and, consequently, could be considered historic resources under California Environmental Quality Act (CEQA) Guidelines. The Mattos Dairy Farm complex was evaluated relative to the following four CRHR eligibility criteria, which are in turn based on NRHP Standards A–D.

- **Criterion 1: Event.** It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.

- **Criterion 2: Person.** It is associated with the lives of persons important to local, California, or national history.
- **Criterion 3: Architecture.** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values.
- **Criterion 4: Information Potential.** It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Mattos Dairy Farm Complex Descriptions

While a review of historic aerials and topographic maps shows the existence of farm structures at the project site as early as 1937, many of those structures have been demolished or replaced over the years. The majority of structures that are present date to the 1950s and 1960s. These i structures consist of a cattle storm shed, hay barn, calf barn and attached wooden shed, a machine shop/garage, a residence and garage located at 6599 West Grant Line Road, and a milk barn. A second residence is also located on the site at 6735 West Grant Line Road, which appears to date to the 1940s. A brief description of each structural element follows:

Cattle Storm Shed

This structure is a circa 1960s, symmetrical, rectangular-shaped, wood framed, cattle storm shed built using wooden-pier and beam construction. The shed is approximately 5,700 square feet in size, is open-walled on all sides, and is currently used to house machinery. The structure, which is in moderate to poor condition, is accessed via openings on the shorter east and west façades. The structure has a concrete and asphalt foundation, and is topped by a low-pitched, open-gabled roof. The roof is clad in corrugated sheet metal on all sides, with open rafters.

Calf Barn and Wooden Shed

This conjoined structure consists of a circa 1950s, symmetrical, rectangular-shaped, calf barn, and connected wooden shed attached to the barn's western façade. The barn is constructed of low cinderblock walls topped with wooden joists, windows, and shiplap siding similar to that used in the shed's construction. The barn and shed are a total of approximately 2,850 square feet in size, closed-walled on all sides, and are currently empty. The conjoined structure is in poor condition due to apparent fire and disrepair and is accessed via doors on the west and north façades. The structure has a concrete and asphalt foundation, and is topped by two low-pitched, open-gabled roofs. The roofs are clad in wooden shingles with open rafters.

Machine Shop/Garage

This structure is a circa 1950s, symmetrical, rectangular-shaped, wood framed, machine shop/garage built using wooden shiplap construction. The shop/garage is approximately 1,400 square feet in size and is currently used to house machinery. The structure, which is in moderate to poor condition, is primarily accessed via two rolling garage doors on the right of the western façade. The structure has a concrete and asphalt foundation, and is topped by a low-pitched, open-gabled roof. The roof is clad in corrugated sheet metal on all sides, with open rafters.

The Residence at 6599 West Grant Line Road

This structure is a circa 1950, 1-story, asymmetrical, square-shaped, minimal traditional-style single-family residence and detached garage. The 900-square-foot building, which is in poor condition and has been abandoned, is accessed by a small, two-stair, small concrete porch leading to a single door on the building's western façade. The building has a concrete foundation, light green stucco exterior, and a low-pitched cross-hipped roof with moderately sized eaves that wrap around the entire structure. The roof is clad in tan-gray composition shingling, and the rafters are semi-enclosed with plywood planking. The building's windows vary in size, shape, and placement, but are primarily aluminum-framed, rectangular-shaped, and double-hung sash-style. The property has almost no landscaping as the concrete foundation extends to the street, with the exception of a large tree growing to the left of the entrance on the eastern façade. An unattached, symmetrical two-car garage of identical construction is situated immediately south of the residence. The original windows and roof appear to have been replaced, but no other major exterior alterations were noted.

The Residence at 6735 West Grant Line Road

This structure is a circa 1940, 1-story, asymmetrical, rectangular-shaped, minimal traditional-style single-family residence. The 1,700-square-foot building, which is in moderate to poor condition, is accessed by a small, single-stair, enclosed concrete porch leading to a single door on the building's southern façade. The building has a concrete foundation, light green stucco exterior, and a low-pitched cross-hipped roof with small-sized eaves that wrap around the entire structure. The roof is clad in tan-gray composition shingling, and the rafters are semi-enclosed with plywood planking. The building's windows vary in size, shape, and placement, but are primarily aluminum-framed, rectangular-shaped, and double-hung sash-style. The property has minimal landscaping a lawn extending south and two trees growing to the left and right of the main entrance on the southern façade. The original windows and roof appear to have been replaced, but no other major exterior alterations were noted.

Milk Barn

This conjoined structure consists of a circa 1950s, symmetrical, rectangular milk barn and connected square, cinderblock loading-shed attached to the barn's southern façade. The barn is constructed of high cinderblock walls identical to use in the shed's construction, with regularly spaced aluminum open-faced windows along the barn's eastern and western sides. The conjoined barn and shed are a total of approximately 2,900 square feet in size, in fair condition, and are accessed primarily via doors on the north and south façades. The structure has a concrete and asphalt foundation that takes the form of a small, raised loading dock running along the southern façade of the shed. The shed is flat roofed and clad in tar-paper, while the barn is topped with an aluminum low-pitched, open-gabled roof.

NRHP, CRHR, and Local Historical Listing Evaluation

The existing Mattos Dairy Farm complex is part of the overall development and expansion of the agriculture industry following the establishment of the Central Pacific Railroad and the incorporation of the City in the early 20th century. The dairy industry continued to thrive in Tracy despite the decline of the railroad in the 1950s and 1960s and continues to be an important part of the regional economy to this day. The subject property is part of that process of expansion and growth, but does

not meet Criterion A: Event, as there are examples of many similar and better-known dairy farms built during this time in the greater Tracy area.
